As in previous reports, estimates of SWP deliveries are based upon operation simulations with DWR's CalSim II model using an extended record of runoff patterns. These patterns have been adjusted to reflect the levels of development in the source areas and, for future conditions, possible impact due to climate change. Potential deliveries under current conditions are estimated at the 2007 level and assume current methods of conveyance across the Delta and the interim operating rules defined by the recent court order to protect delta smelt. Potential deliveries under future conditions are estimated at the 2027 level and are also based on the assumption that no changes will be made in either the way water is conveyed across the Delta or in the interim operating rules to protect delta smelt. The analysis of future conditions incorporates climate change scenarios which correspond to the scenarios contained in DWR's 2006 report, *Progress on Incorporating Climate Change into Management of California's Water Resources*.

- the recent and significant decline in pelagic organisms in the Delta (open-water fish such as delta smelt and striped bass);
- climate change and sea level rise; and
- the vulnerability of Delta levees to failure due to floods and earthquakes.

The report discusses areas of significant uncertainty to SWP delivery reliability:

The analysis shows that annual SWP deliveries (Table A and Article 21 amounts) would decrease virtually every year in the future (93% of future years). These reductions would be amount to a 20% reduction from current levels about one-fourth of the time, and greater than 30% in one-sixth of future years.

This report represents the state of water affairs if no actions for improvement are taken. It shows a continued eroding of SWP water delivery reliability under the current method of moving water through the Delta.

The report shows that future SWP deliveries will be impacted by two significant factors. The first is climate change, which is altering hydrologic conditions in the State. The second is significant restrictions on SWP and Central Valley Project (CVP) pumping in accordance with a December 2007 federal court imposed interim rules to protect delta smelt. The 2007 report incorporates future impacts on water deliveries to communities due to these factors.

The report is produced every two years as part of a settlement agreement signed in 2003. The Draft State Water Project Delivery Reliability Report 2007 updates DWR's estimate of current (2007) and future (2027) SWP delivery reliability and expands the conditions under which reliability is quantified.

## **Draft State Water Project Delivery Reliability Report, 2007** **Summary:**

California Department of Water Resources  
Bay-Delta Office  
January 22, 2008

Under current conditions, annual SWP Article 21 deliveries average 90 taf, ranging from 0 to 590 taf over the 82-year simulation period. Over the multiple-year wet period of 1978-1987, SWP Article 21 deliveries average 170 taf and range from 0 to 490 taf.

Due to the uncertainty of impacts by climate change on the availability of source water, SWP Table A and Article 21 deliveries under future conditions are expressed as a range in values. Under future conditions, annual SWP Table A deliveries from the Delta average from 66 to 69% of the maximum Table A amount. Although the estimated average annual amount of future SWP Table A deliveries increase when compared to current conditions, the amount of Article 21 deliveries decrease. Also, the amount of SWP Table A deliveries during multiple-dry periods in the future tend to decrease compared to current conditions. This decrease can be significant, depending upon the climate change scenario. This difference in future deliveries is reflected in lower SWP Table A delivery amounts associated with a 75% exceedence level (1,860 to 2,077 taf per year) than is for current conditions (2,168 taf per year).

Under future conditions, annual SWP Article 21 deliveries average 30 taf, ranging from 0 to 420 taf over the 82-year simulation period. Over the multiple-year wet period of 1978-1987, SWP article 21 deliveries average approximately 95 taf per year and range from 0 to 420 taf, depending upon the year and the climate change scenario.

The updated estimates of both current and future total annual SWP deliveries in *The Draft State Water Project Delivery Reliability Report, 2007* report are generally less than were estimated in the 2005 report, at times substantially so. As shown in the figure below, the current total annual SWP deliveries (Table A and Article 21 amounts) decrease in 93% of the years based on the historical data used in the analysis, when compared to the estimates in the 2005 report. Updated estimates for the current level of reliability show the total annual deliveries decrease over 20% in over one-quarter (28%) of the years analyzed and greater than 30% in one-sixth (16%) of the years, when compared to the estimates in the 2005 report. Water deliveries estimated for 20 years into the future show even greater decreases in a majority of years when compared to the estimates in the 2005 report.

The *Draft State Water Project Delivery Reliability Report, 2007* is available for public review via the DWR Home Page, <http://www.water.ca.gov>. The report is an update to the *State Water Project Delivery Reliability Report, 2005* issued as final in 2006. At least 30 days will be given for public review and comment.

By Terence Choa  
Associated Press

**SAN FRANCISCO** — The number of chinook salmon returning to California's Central Valley has reached a near-record low, pointing to an "unprecedented collapse" that could lead to severe restrictions on West Coast salmon fishery, according to federal fishery regulators.

#### INSIDE

Delta smelt numbers decline despite efforts to save fish. The sharp drop in chinook, or "king," salmon returning from the Pacific Ocean to spawn in the Sacramento River and its tributaries last fall is part of a broader decline in wild salmon runs in rivers across the West.

The population dropped more than 88% from its all-time high five years ago, according to an internal memo sent to members of the Pacific Fishery Management Council and obtained by The Associated Press.

Regulators are still trying to understand the reasons for the shrinking number of spawners; some scientists believe it could be related to changes in the ocean linked to global warming.

THE FRESNO BEE » **NEWS** « WEDNESDAY, JANUARY 30, 2008

# Salmon: Juvenile figures are low

Continued from Page A1

Some fishermen and environmentalists believe the sharp decline is related to increased water exports from the Sacramento-San Joaquin Delta, which supplies drinking water to millions of people in dry Southern California, as well as irrigation for America's most fertile farming region.

"It's time to reduce pumping of delta waters before we destroy the fish and wildlife species we appreciate so much in California," said Mike Sherwood, an attorney for Earthjustice.

Federal lawmakers, meanwhile, are considering how to pay for a plan to restore salmon to the San Joaquin River, which was North America's southernmost salmon run until Friant Dam was completed in 1944 and portions of the river dried up.

Environmentalists filed a federal lawsuit in 1988 and won, prompting Friant-area farmers to reach a settlement in 2006 that would reduce annual irrigation deliveries to free up more water for the river. The settlement also calls for channel improvements and other changes. If all goes as planned, salmon would be reintroduced in the San Joaquin by 2013.

But the federal fishery regulators' memo reports that only about 90,000 returning adult salmon were counted in the Central Valley in 2007, the second-lowest number on record. The

THE PRESS DEMOCRAT FILE

Salmon fisherman Dan Kleinman unloads his catch Aug. 8, 2005, at Tides Wharf in Bodega Bay. The number of chinook salmon returning to the Central Valley is at an all-time low that could lead to severe restrictions on West Coast salmon fishing this year.

population was at 277,000 in 2006 and 804,000 five years ago.

In an e-mail to council members, Donald McIsaac, the agency's executive director, said he wanted to give them "an early alert to what at this point appears to be an unprecedented collapse in the abundance of adult California Central Valley ... fall Chinook salmon stocks."

"The magnitude of the low abundance ... is such that the opening of all marine and freshwater fisheries impacting this important salmon stock will be

40,000 juveniles, or "jacks," return each year.

Salmon that spawn in Central Valley rivers form the backbone of the West Coast's commercial and recreational salmon fishery and are caught by fishermen from Southern California to British Columbia.

"Sacramento fish are really what the fishery depends on," said Chuck Tracy, the council's salmon management officer.

Not long ago, salmon restoration efforts in the Sacramento watershed were being touted as a wildlife management success story.

But recent years have seen populations dwindle in many Western rivers, and scientists are trying to understand why.

The council plans to meet in Sacramento in March to discuss possible restrictions, including a complete closure of the salmon season that begins in May. Final decisions will be made in April.

Duncan MacLean, a Half Moon Bay fisherman who is on a team that advises the fishery council, said he is bracing for hard times.

"It's probably going to be worse than anything we've experienced before," said MacLean, 58, who relies on salmon fishing for as much as 70% of his income. "It's going to put a lot of us out of business."

# Delta smelt's numbers decline

Costly effort to save fish appears to be failing.

By Michael Doyle

Bee Washington Bureau

**WASHINGTON** — Millions of dollars and untold gallons of water have failed to stop a precipitous decline in the population of the endangered delta smelt, officials acknowledged Tuesday.

In a sobering assessment, state and federal officials told a House panel that their big investment in the "tiny" smelt hasn't paid off yet. Smelt officials estimate that the concession comes at an additional \$10 billion or more for new water-supply projects and environmental work to address California's long-term water problems.

The 3-inch-long smelt found in the sprawling estuary where the Sacramento and San Joaquin rivers meet is considered an indicator of the delta's health.

Starting in 1993, the smelt has been protected as threatened under the Endangered Species Act.

It has been a major beneficiary, although not the only one, of the 1.5 million acre-feet of Central Valley water set aside annually for environmental protection.

Even so, the smelt's popula-

Continued from Page B1

tion last year was only about 2.4% of the population noted when it was placed under federal protection in 1993.

"Obviously, we haven't had the success with the delta smelt that we would have wanted," Bureau of Reclamation Commissioner Robert Johnson said.

Johnson said he could not even estimate how much money has been spent on measures to protect the fish, although it's likely in the tens of millions of dollars.

"The [delta] system is still in decline," California Department of Water Resources Director Lester Snow told the House water and power subcommittee.

The House panel convened the hearing Tuesday in part to let San Joaquin Valley residents like Los Banos farmer Jean Sagoupe and Firebaugh City Manager Jose Ramirez vent about their region's water shortfalls.

In part, the hearing could set the stage for federal legislation, although nothing specific has been introduced yet.

The hearing also follows a ruling by Fresno-based U.S. District Judge Oliver Wanger. Last year, Wanger imposed tighter pumping limits in order to leave more water in the delta for protection of the smelt.

Wanger's ruling could cut irrigation deliveries south of the delta by between 20% and 30% annually.

Snow cautioned that "we don't know

precisely how much water we will have year to year."

State and federal officials said they didn't know precisely how much of the smelt's population decline has been caused by something other than irrigation pumping.

Repeatedly Tuesday, Rep. Jim Costa, D-Fresno, and other San Joaquin Valley lawmakers insisted that numerous small pumps not part of the state and federal water projects could account for some of the delta's problems.

The political implication is that Valley farmers are shouldering too much of the burden for restoring the smelt's delta habitat.

The hearing also comes as legislators in Sacramento and Washington consider expensive fixes for California's long-term water problems. These proposed solutions cited Tuesday include an estimated \$3.5 billion for new reservoirs, between \$3 billion and \$4.5 billion for a conveyance facility to haul water around the delta, and some \$2.4 billion for various delta habitat improvements.

Federal funding, so far, hasn't met the state's anticipated needs, and California lawmakers pressed Bush administration officials Tuesday to provide more money.

"If we're going to make this happen, we have to get all the California folks to say this is a high priority for us," Costa said.

## Tulare County General Plan

salt sinks. The remaining runoff (2 – 3 percent) is available as a renewable water supply for urban, agricultural, and environmental uses.

Table 10-1 shows California's estimated water supply, for average and drought years under 1995 and 2020 levels of development, with existing facilities and programs. This information is excerpted from the *California Water Plan*, prepared by the California Department of Water Resources. The state's 1995-level average year water supply was about 77.9 million acre-feet (maf), including about 31.4 maf of dedicated flows for environmental uses.

**Table 10-1. California Water Supplies with Existing Facilities and Programs<sup>a</sup> Thousand Acre Feet (taf)**

Supply	1995		2020

<sup>a</sup> Bulletin 160-98 presents water supply data as applied water, rather than net water. This distinction is explained in a previous section. Past editions of Bulletin 160 presented water supply data in terms of net supplies.

<sup>b</sup> Excludes groundwater overdraft

Source: Department of Water Resources, California Water Plan.

## 10. Natural Resources

The annual average statewide supply is projected to increase about 0.2 maf by 2020 without implementation of new water supply options. While the expected increase in average year water supplies is due mainly to higher Central Valley Project (CVP) and State Water Project (SWP) deliveries (in response to higher 2020-level demands), new water production will also result from groundwater and from recycling facilities currently under construction.

The state's 1995-level drought year water supply was about 59.6 maf, of which about 16.6 maf is dedicated for environmental uses. Annual drought year supply is expected to increase slightly by 2020 without implementation of new water supply options. The increase is expected to be created through higher CVP and SWP deliveries and new production from surface water, groundwater, and recycling facilities currently under construction.

**Surface Water Supplies**

Surface water supplies for the Tulare Lake Basin include developed supplies from the CVP, the SWP, rivers, and local projects. Surface water also includes the supplies for required environmental flows. Required environmental flows are comprised of undeveloped supplies designated for wild and scenic rivers, supplies used for instream flow requirements, and supplies used for Bay-Delta water quality and outflow requirements. Finally, surface water includes supplies available for reapplication downstream. Urban wastewater discharges and agricultural return flows, if beneficially used downstream, are examples of reapplied surface water.

**Central Valley Project.** The Legislature authorized the State Central Valley Project in 1933. Because California was unable to sell the bonds needed to finance the project during the Great Depression, the United States Bureau of Reclamation (USBR) initiated project construction. Initial congressional authorization for the CVP included facilities such as Shasta and Friant Dams, Tracy Pumping Plant, and the Contra Costa, Delta-Mendota, and Friant-Kern Canals.

The USBR's CVP is the largest water storage and delivery system in California, comprising of 29 of the state's 58 counties. The project's features include 18 federal reservoirs and 4 additional reservoirs jointly owned with the State Water Project. The keystone of the CVP is the 4.55 maf Lake Shasta, the largest reservoir in California. CVP reservoirs provide a total storage capacity of over 12 maf, nearly 30 percent of the total surface storage in California, and deliver about 7 maf annually for agricultural (6.2 maf), urban (0.5 maf), and wildlife refuge use (0.3 maf) (Table 10-2).

## Notes:

- 1) "More than Adequate" means that facilities appear capable of serving growth beyond build-out of the General Plan.
- 2) "Adequate" means (1) apparent capacity to serve build-out growth with little financial, technical or environmental difficulty; and (2) clear capacity to serve projected growth.
- 3) "Adequate with Concerns" means that the provider either has the capacity to serve projected growth or is likely to solve capacity issues within the time horizon of the General Plan.
- 4) "Significant Concerns" means that the provider lacks capacity to serve projected growth and is likely to experience significant difficulties in expanding the system to meet projected demand.
- 5) Source of information is from Municipal Service Reviews Adopted by the Tulare County Local Agency Formation Commission (for applicable Districts) and from discussions with District staff members.

## Income Inequality Grew in California Over the Past Two Decades

### California's Richest Families vs. Poorest Families

- The *richest* 20 percent of families have average incomes **7.9** times as large as the *poorest* 20 percent of families.
- This ratio was **6.5** in the late 1980s.
- This growth in income inequality is the **18th** largest in the nation.
- The very richest families — top 5% — have average incomes **13.3** times as large as the poorest 20 percent of families.

The gap between California's richest and poorest families is **8th** largest in the nation.

### California's Richest Families vs. Families in the Middle

- The *richest* 20 percent of families have average incomes **2.9** times as large as the *middle* 20 percent of families.
- This ratio was **2.3** in the late 1980s.
- This growth in income inequality is the **5th** largest in the nation.

The gap between California's richest families and families in the middle is **3rd** largest in the nation.

## A Closer Look: Short- and Long-term Trends

### Late 1990s to mid-2000s

- The average income of the *poorest* fifth of families did not change significantly.
- The average income of the *middle* fifth of families increased by **\$1,889**, from \$49,092 to \$50,981.
- The average income of the *richest* fifth of families increased by **\$16,772**, from \$128,587 to \$145,358.
- The average income of the *richest* 5% of families increased by **\$41,988**, from \$201,397 to \$243,386.

### Late 1980s to mid-2000s

- The average income of the *poorest* fifth of families increased by **\$1,926**, from \$16,386 to \$18,312.
- The average income of the *middle* fifth of families increased by **\$4,401**, from \$46,580 to \$50,981.
- The average income of the *richest* fifth of families increased by **\$39,103**, from \$106,255 to \$145,358.
- The average income of the *richest* 5% of families increased by **\$89,456**, from \$153,929 to \$243,386.

## How Many Californians?

### *A Review of Population Projections for the State*

*By Hans P. Johnson*

#### *Summary*

The level of plausible variation in California's future population requires serious consideration by policymakers and planners. Planning and building infrastructure for the wrong population can be costly. To give policymakers and others concerned with projecting population a sense of the range of projections and why the range is so wide, this report compares and analyzes population projections produced for the state by various organizations: the California Department of Finance, the U.S. Census Bureau, the U.S. Bureau of Economic Analysis, UCLA, and the Center for Continuing Study of the California Economy. Those projections are used in short- and long-range planning by local, state, and federal government agencies, as well as by private firms.

The current projections agree on some basic issues: Growth rates will be lower than in the past, but absolute levels of growth will remain high. Natural increase will have more effect than net migration on population growth. Domestic migration will be lower, while international migration will remain strong. California will still have higher growth rates than the rest of the country. However, the projections of future population and rates of population growth vary widely. For example:

- For 2025, the highest and lowest projections differ by more than 10 million people, with the lowest series projecting a population of 41.5 million and the highest projecting over 52 million. By 2040, the difference is over 16 million people (almost half the state's current population), with the lowest projection setting the state's future population at 46.8 million and the highest at 63.4 million.
- These projections imply very different rates of population growth between 1995 and 2025. In the highest projection, California will have another 20 million people by 2025,

L

Enclosure 12

Public Policy Institute of California

*California Counts*

## How Many Californians?

**The level of plausible variation in California's future population requires serious consideration by policymakers and planners.**

or 64 percent of the state's 1995 population. The lowest projection suggests only about 8 million more, or 29 percent of that population.

- The projections differ substantially in some characteristics of the state's future population: e.g., the size of the state's white population and the age structure.

Each of the projections is plausible if you accept its assumptions regarding migration to and from California. The differences in migration assumptions drive almost all of the differences among the various projections. Over the past 15 years, domestic migration between California and other states has fluctuated dramatically. It is possible that California is on the verge of a new demographic era, one in which the state no longer attracts more domestic migrants than it sends out. It is also possible that the state will return to its longtime demographic history of being a place that attracts more migrants from other states than it sends to those states. The lowest projections assume the former, while the highest projections assume the latter. The most recent evidence indicates that the large domestic migration losses of the early 1990s have ceased, although the state has not returned to the positive flows of domestic migrants that characterize the state's past.

Planners need to be aware of the range of plausible future population levels of the state, and should, accordingly, consider alternative scenarios in their planning.

Public Policy Institute of California

*California Counts*

How Many Californians?

**Context**

**T**he distinguishing feature of California's population is its tremendous dynamism. That dynamism is evident not only in California's rapid population growth, but also in the increasing diversity of the state's population. For decades, California's population growth rates have rivaled those of many less developed countries rather than typifying those of developed regions of the world. As recently as 1950, the state had only 10 million residents, less than one-third of today's 33 million. Over the past few decades, the state also experienced a dramatic increase in ethnic and cultural diversity. In 1970, white non-Hispanics accounted for almost 80 percent of the state's population; today, they account for approximately half of the state's population. By 2020, Latinos will be the single largest ethnic group in the state.

The sheer size of the state's population increase has important implications for almost all government services and functions including welfare, education, transportation, and corrections. Large increases in the state's population also have important implications for protection of natural resources, distribution of water, agriculture, and location and nature of development. No less important, but less predictable, is how the changing composition of

the state's population will influence the state's economic evolution, its political representation, and its cultural identity or identities. Projections of 50 million Californians by 2025 suggest that policy issues related to population growth will become even more salient to policymakers. However, projecting future populations is an uncertain undertaking. The demographic future of California is very much in doubt. The recession of the early 1990s saw record numbers of domestic migrants leaving California. From 1990 through 1996, between 1 million and 2 million more people left California for other states than moved to California from the rest of the United States. At the same time, immigration (international migration) to the state increased substantially during the 1970s and 1980s and, though slowing, still remained substantial during the recession of the early 1990s. Some argue that the patterns of the early 1990s ushered in a new era of demographic change in California. Some predict that the state, once a magnet for migrants from the rest of the country as well as the world, will be the next demographic New York: a place that receives immigrants and sends out domestic migrants. Projections of the state's population are heavily influenced by assumptions about migration patterns.

In this report, we compare and analyze a number of long-

**In California, domestic migration has been especially volatile over the past ten years.**

term population projections for California. First, we discuss the projected populations, then compare the various methods and assumptions used to develop the projections, and finally discuss some implications of the comparisons. Additional charts, tables, and analyses are available on our website at [www.ppic.org](http://www.ppic.org).

**Long-Term Projections for California**

**T**hree government agencies and two independent organizations produce long-term population projections for California: the California Department of Finance (DOF), the United States Census Bureau (CB), the United States Bureau of Economic Analysis (BEA), the Anderson Forecast at UCLA, and the Center for Con-

3

**Projections of  
the state's  
population  
diverge widely  
over time.**

tinuing Study of the California Economy (CCSCE). The Census Bureau produces two sets of state population projections: Series A, the "preferred" series, and Series B, the "alternative" series. CCSCE produces three series of projections: high, middle, and low. Projections are revised every few years as additional data become available (e.g., a new census) or as population trends diverge from earlier projections. The BEA has ceased making economic and population projections.

The length of the projection series and the level of demographic detail vary among the series (see

Table 1). The projections produced by the California Department of Finance and the Census Bureau are most directly comparable in terms of demographic detail. The Census Bureau projections extend to 2025, whereas all the other series extend to at least 2040.

**Total Population and  
Growth Rates**

Projections of the state's population diverge widely over time (see Figure 1 and Table 2). By 2025, the difference between the highest and lowest projection is greater than 10 million people, with the

**Table 1. Sources of Long-Term Population Projections for California**

Source	Projection Years	Year Issued	Demographic Detail
California Department of Finance (DOF)	1998–2040	1998	Single year of age; five race/ethnic groups; 58 counties
United States Census Bureau (CB)	1995–2025	1996	Single year of age; five race/ethnic groups; two series: preferred and alternative
United States Bureau of Economic Analysis (BEA)	1993–2045	1995	Broad age groups
UCLA Anderson Forecast	1996–2050	1998	Eight regions within the state
Center for Continuing Study of the California Economy (CCSCE)	1997–2050	1998	Broad age groups; subregions; * three series: high, middle, low

Public Policy Institute of California

*California Counts*

How Many Californians?

Figure 2. Population Growth Rates: Annual Percentage Change

state's population growth between now and 2025. By 2040, the difference between the highest and lowest projections increases to over 16 million people (almost half the state's current population), with UCLA projecting 63.4 million Californians and the CCSCE low series projecting only 46.8 million.

These projections imply very different levels of population growth. The highest projections suggest that California will need to accommodate another 20 million people by 2025, while the lowest suggest the state's population growth will total only about 8 million people between 1995 and 2025. Total population increases would amount to 29 percent of the state's 1995 popula-

tion according to the lowest series, compared with 64 percent according to the highest series.

The projections show substantial differences even in the short run. Both Census Bureau series project substantially lower population totals than do the other series. For example, the CB series project fewer than 34.5 million California residents in 2005 whereas the DOF projects 37.4 million Californians. This short-term difference is a product of both differing projections of growth and differing current estimates of the state's population at the time the projections were made. During the 1990s, the Census Bureau estimates of the state's population have increasing-

ly diverged from those produced by the DOF: By 1998, the Census Bureau estimates were lower than the DOF estimates by more than 800,000.

As shown in Figure 2, annual growth rates implied by these projections are substantially different—especially the initial projected growth rates, in which the CB projections are three times higher than the DOF projections. The large disparity in initial rates results from differing base years for the projections. The CB projections were developed at a time when the most recent estimates suggested substantial domestic out-migration from California and population growth in the state was quite slow by historic standards.

*California Counts*

How Many Californians?

Although the CB projected growth rates are higher than growth rates experienced by the state in the recession, the CB projections did not anticipate the dramatic short-run change in growth rates that occurred between 1994 and 1998 (see Figure 2). Again, if we exclude the alternative series (CCSCE high, CCSCE low, and CB alternative), the range of long-term projections is substantially narrowed.

**Population by Race/Ethnicity**

Only the projections by the California Department of Finance and the Census Bureau provide race/ethnic detail. While the DOF and CB projections agree on the direction of race/ethnic distributional changes in the state's population, the projections differ on the magnitude of those changes (see Figure 3). In particular, the DOF projects that a somewhat larger share of the population will be white and a somewhat smaller share will be either Latino or Asian and Pacific Islander than the CB projects. According to the CB projections, no race/ethnic group currently constitutes a majority of California's population. According to the DOF projections, that state will be reached between July 2000 and July 2001. The CB preferred series projects that by 2014 Latinos will be the largest single race/ethnic group in the

**Figure 3. California Population by Race/Ethnic Distribution**

Public Policy Institute of California

*California Counts*

## How Many Californians?

state, whereas the DOF projection places that date at around 2021.

In absolute terms, the difference between the CB alternative series and the DOF projections is especially pronounced for whites, with the DOF projecting almost 6 million more whites by 2025 than the CB alternative projections (see Table 3). The lower population of whites in the CB series can be attributed to project-

ed continuing net domestic migration losses. Domestic migrants, both to and from California, are more likely to be white than are immigrants or non-migrants in the state.

**Age Structure**

An easy way to summarize the age structure of a population is to examine the dependency ratio.

The dependency ratio is the number of people of nonworking age (less than 18 and over 65) for every 100 people of working age. It provides a rough indicator of a population's ability to support nonworking members. The DOF, CB, and BEA projections each provide projections by age. As shown in Figure 4, California's dependency ratio is projected to increase substantially after 2010,

Table 3. Population Projections by Race/Ethnicity (in thousands)

		1995	2000	2005	2010	2015	2020	2025	2030	2035	2040

How Many Californians?

as large cohorts of baby boomers begin to enter retirement ages. Because of the certain aging of the baby boom, there is little variation in projections of overall dependency ratios.

To the state government, however, the most important component of the dependency ratio is that attributable to children, because the state is the primary provider of services to children (via education) and provides relatively few services to the elderly. After a substantial rise in the child dependency ratio during the 1990s, the DOF and BEA series project a decline to the mid-2010s, followed by an increase (see Figure 5). This is a welcome short-term trend for a state trying to catch up with large increases in public school attendance. The CB projections show an increase in the child dependency ratio from 1995 to the first few years of the next century, before declining to the mid-2010s. After 2015, however, all the series project that the child dependency ratio will increase substantially, rising to levels not seen since the early 1970s according to the DOF projections.<sup>2</sup> The BEA projections show the same long-term pattern, but the increases are substantially lower.

<sup>2</sup> The higher child dependency ratio projections based on the CB preferred series are due to higher fertility projections. The lower BEA projections are based on a method that does not explicitly consider fertility.

Figure 5.  
Historic and Projected Child Dependency Ratios for California

Public Policy Institute of California

*California Counts*

## How Many Californians?

**Despite their wide disparities, the current projections agree on some basic issues.**

## Methods and Assumptions of the Projections

**A**lthough some of the variation in the population projections results from differing methodologies, the most important source of variation is differing assumptions. Assumptions differ largely because population trends differed when the projections were developed. Most projections weight recent trends heavily in forecasting long-term trends.

### Methods

Methods used to project California's population range from the computationally complex "multi-state cohort component projection" technique employed by the Census Bureau to the simple derivative approach employed by UCLA. The projections can be classified into three types: (1) purely demographic (DOF, CB preferred); (2) demographic and economic (CB alternative, BEA, and CCSCE); and (3) derivative extrapolations (UCLA). The purely demographic approaches of the DOF and the CB preferred

projections rely on an analysis of historical trends in the components of population change: births, deaths, and migration. This approach implicitly assumes that factors that led to such trends in the past will continue in the future. The methods that incorporate economic factors do so because employment is assumed to drive population growth through migration. Migration, especially domestic migration, to or from California responds strongly to employment opportunities in California versus the nation. The methods employed by CCSCE, BEA, and the CB alternative series use projections of employment to determine future populations of the state. UCLA's projections are primarily based on and extrapolated from an earlier set of projections produced by the Department of Finance, but also include a subjective assessment of recent economic conditions in the state. Finally, some of the state projections consider national population projections (CCSCE, BEA, CB), while others do not (DOF, UCLA).

More complex methods do not necessarily produce more accurate projections, although they might provide details (such as populations by age and gender) that are necessary to the user. Key sources of uncertainty are future employment, domestic migration, and fertility. For example, a decline in fertility rates could lead

to substantially lower population projections over the long term for California than the DOF and CB projections currently envision.

### Assumptions

When projections are developed partly explains differences between them. The most recent economic and demographic trends available at the time a projection is made are important factors in projecting future trends. In California, domestic migration has been especially volatile over the past ten years. The CB and BEA projections were developed when the most recent data showed massive domestic out-migration from California. Since those projections were developed, however, the large domestic migration outflows have ceased. The DOF, CCSCE, and UCLA projections were all developed after this turnaround, and thus show higher short-term projections. Figure 6 shows the importance of timing for the projections by comparing the DOF and CB migration estimates and projections.

### Accuracy, Agreement, and Implications

**D**emographers have not been particularly successful in identifying and forecasting turning

Public Policy Institute of California

*California Counts*

## How Many Californians?

points in population growth. For example, two of the most profound demographic events in the last half of the twentieth century, the baby boom and the baby bust, were not accurately foreseen by demographers.

It is not clear which of the current projections for California are most accurate. Based on when the projections were developed, we can conclude that the CB and BEA projections are too low, at least in the short run. In the long run, the wide range of current population projections reflects the uncertainty of California's demographic future. Although the short-term projections of the CB and BEA are too low, any of the long-term population projections could be realized. None of the scenarios represented by the projections are unrealistic. The highest projection series (UCLA) implies annual growth rates for California that are lower than for any comparable historic period. The lowest projection series (CCSCE's low series) assumes that California's share of national employment growth will be only moderately lower than in the past.

Despite their wide disparities, the current projections agree on some basic issues:

- California's future growth rates will be generally lower than past rates, though absolute levels of growth will remain high.

**Figure 6. Estimates and Projections of Net Migration**  
Census Bureau and Department of Finance

- Natural increase will be a greater source of population growth in the state than net migration.
- Domestic migration is not forecast to be as great as in the past, while international migration will remain strong.
- California growth rates will still exceed those of the rest of the nation.

The level of plausible variation in California's future population requires serious consideration by policymakers and planners. Prudent planners should consider several different future levels of

**In the long run, the wide range of current population projections reflects the uncertainty of California's demographic future.**

California's population in developing their plans. Planning and building infrastructure for the wrong population can be costly. These costs should be explicitly considered and evaluated in developing plans for alternative future scenarios. ♦

Public Comments to the Planning Commission on April 23, 2008  
Regarding the Tulare County General Plan Update 2030

Five reputable organizations make population projections for California. Tulare County chose to use the predictions of the California Department of Finance which made some of the highest population projections. The Supervisors seem to have concluded we need to put these people in all parts of the county, regardless of the consequences of greater air pollution, groundwater contamination, groundwater overdraft, infrastructure costs, and loss of agricultural land.

The Public Policy Institute of California in October 1999 analyzed the causes of population growth and the accuracy of population projections over time. Different organizations predict widely varying numbers of people over the 26 year time period from 1999 to 2025 from 29% to 64% population growth. The Institute found population predictions are accurate only 10 years into the future. The Public Policy Institute of California states the California population growth rate will be lower than in the past because:

- birth rates are declining
- there will be less interstate migration to California because there are fewer job opportunities due to our recession
- there will be less international migration to California because of fewer jobs and the crackdown on illegal immigration at the Mexican border and at workplaces that employ illegal aliens. These migrants don't want to spend time in jail and be deported.

Tulare County Supervisors need to consider the level of plausible variation in population projections. Planning and building infrastructure for the wrong population can be costly. I

Attachment 40

In the beginning of the Goals and Policies Report under General Plan Framework Value Statements, there are serious omissions. Clean air, clean water, and adequate water supply are not mentioned. Protection of natural resources was the first priority of the citizens in the public workshops conducted by RMA and in the Blueprint workshops conducted by the Great Valley Center. After reading the General Plan Update, I believe omission of clean air, clean water, and water supply in the Value Statements was intentional. In the Air Quality and Water Resources sections air and water are not protected by mandatory policies and enforceable implementation measures. "Shall encourage", "shall identify", "shall promote", "shall support", "shall monitor", "shall consider", "as appropriate", and "where feasible" do not guarantee compliance. The County has no trouble putting mandatory wording in policies protecting oil and gas resources, prime timber resources, and rock and gravel quarries. They have obvious monetary value. It's harder to calculate the cost of an asthma attack, increased risk of cancer or reduced crop yield due to poor air quality or the impact of nitrate laden groundwater on a child or pregnant woman. It's harder, but possible, and has been achieved by other counties. On the other hand, the cost of drilling a deeper well because new development has continually lowered the groundwater level can be easily quantified. All the environmental consequences of this General Plan buildout have not been disclosed, analyzed, and mitigated. CEQA requires this. This DEIR must be redone and the Goals and Policies Report revised to address the real threats to human health and the environment.

To the Board of Supervisors and Planning Commission at Joint Hearing on February 26, 2008, Addressing General Plan Update Omissions

There are serious omissions in the Value Statements listed on page ES-6 of the Draft Environmental Impact Report of the Tulare County General Plan Update.

Clean air, clean water and sustainable water were top priorities of the citizens of Tulare County during all the public workshops and the Blueprint Process.

I have carefully read the Air Quality and Water Resources elements of the Goals and Policies Report of the Tulare County General Plan. The policies and implementation measures for air quality, water supply and water quality are weak, vague, and unenforceable.

We need clean air. This General Plan Update makes air quality worse. You know that.

A sixth value statement must be added to specifically, directly address air quality, water quality and water supply.

And the policies and implementation measures must be made mandatory. Every mitigation must be mandatory and sufficient to offset the adverse impact.

Carole Clum

Attachment 41

Comments by Carole Clum to the Board of Supervisors at the Hearing on Draft General Plan Update, Feb. 26, 2008

It is impossible to assess and mitigate the impact of new development on water resources when the decision makers do not have a complete, accurate, current description of the existing environment. It is only against this baseline that intelligent decision making can be made. The DEIR analysis of water supply and water quality is fundamentally flawed because:

- Keller-Wegley Report, a major document used to assess water supply and water quality, is incomplete, missing vital figures and community maps assessing adverse impacts on many unincorporated communities due to loss of water from the Friant-Kern canal. Nevertheless, Dennis Keller, notes the uncertainty of the outcome of the NRDC v. Rodgers case concerning the restoration of the San Joaquin River, depending on the successful rebound of the chinook salmon,
- No consideration of the delta smelt decision to restore the Sacramento delta and limit water exported to Tulare County,
- No consideration of Global Climate Change and scientists' consensus that Tulare County will receive increasingly less precipitation and less snowpack and will experience ever warmer average temperatures which will adversely impact water supply, groundwater overdrafting and groundwater contamination and recharge.
- Absolutely no consideration of serious groundwater overdrafting now in Tulare County,
- Inadequate and inaccurate data in Table 4-5, page 4-107 of the DEIR, which purports to show the ability of 21 unincorporated communities to meet population growth demands of the General Plan Update buildout to 2030,
- Most of the water resources data was collected in 2003 or earlier. This DEIR was published in 2008,
- No consideration of the significant adverse impact on hydrology of Global Climate Change as echoed in the State Water Project Delivery Reliability Report of Jan. 22, 2008,
- No consideration of the expense of improving municipal water supply infrastructure and wastewater treatment facilities to accommodate 72% population growth.
- Page 4-130 of the DEIR states, "The majority of domestic water purveyors in unincorporated areas of the County would continue to be dependent upon groundwater to meet their water needs. Until comprehensive assessments of groundwater and groundwater management efforts occur, it is not possible to

conclude that the County's groundwater resources would be capable of meeting future water demands resulting from implementation of the General plan Update.

- There is widespread contamination of groundwater by nitrates, arsenic, DBCP, radon, etc. Until county-wide, comprehensive groundwater quality monitoring occurs, there is no way to determine if the population can grow by 72%.
- No consideration of expense of removing contaminants from groundwater and who will pay. Purchasing filtration systems to remove contamination from water is expensive. Maintaining filtration systems is expensive. And disposing of the concentrated contaminant (now officially hazardous waste) is extremely expensive. Small unincorporated municipal water systems cannot afford the expense. This is especially true of disadvantaged communities.

Re: Review and Comments Regarding Water Resources  
Draft Tulare County General Plan *Goals and Policies Report*,  
*Background Report*, and *Environmental Impact Report*

Dear Mr. Bryant:

Water resources information contained in the Draft Tulare County General Plan is presented in multiple sections in three different documents. The sections have little consistency between them, much is based on old and general data sources, and they are not internally cross referenced rendering the information difficult to access for policy makers and the public, and likely for the document preparers as well.

The pertinent sections of the *Goals and Policies Report* and the *Draft Environmental Impact Report* (DEIR) indicate that they are based upon the "detailed" information contained in the Water Resources section of the *Background Report*. However, there are in fact two unrelated Water Resources sections in the *Background Report*. Both of these Water Resources sections are based on sources that had been revised as of the date of the *Background Report*.

The two Water Resources sections of the *Background Report* need to be updated with current information and integrated into a single comprehensive section. Additionally, the General Plan water resources sections and analysis should address the impacts and planning necessary to address the potentially profound changes to precipitation and Sierra snowpack caused by Global Climate Change.

Once the Water Resources section of the *Background Report* is revised to fully address the present and future water resources of Tulare County, the dependant sections of the *Goals and Policies Report* and DEIR should be revised accordingly.

This letter discusses specific issues and provides comments regarding the three documents.

### **Background Report – Water Resources**

Oddly, there are two different Water Resources sections contained in the *Background Report*. The Water Resources section contained in the body of the report is essentially an extract of the *California Water Plan* published by the State Department of Water Resources in 1998. The *Background Report* is dated December 2007; the 2005 update to the *California Water Plan* should have been used, rather than nearly 10-year-old data.

The other Water Resources section is included as Appendix C of the *Background Report*. While not specifically identified, this document is presumed to be the "Keller, Wegley & Associates" report referenced in other General Plan Documents including the DEIR. Further, the *Background Report* table of contents and introduction make no mention of any appendices. This is the document that was not included in the initial release of the General Plan and DEIR, which resulted in extension of the public review period.

*California's Groundwater* (Bulletin 118, Update 2003) published by the California Department of Water Resources has much more specific information regarding groundwater conditions in the three principal

Attachment 42

Mr. David Bryant  
April 14, 2008  
Page 2

Tulare County subbasins. This document is cited in the DEIR, but is not referenced in, nor was it apparently used for preparation of the Water Resources sections in the *Background Report*.

Most of the references cited in the Water Resources sections are not included in the *Background Report* Bibliography. All citations and reference sources used for the Water Resource sections should be included in the Bibliography.

## **Water Resources Report in Body of Background Report**

The introduction to the Natural Resources section of the *Background Report*, of which the Water Resources section is a part, states "This chapter of the Background Report provides a general overview of water resources and mineral resources within Tulare County to identify and understand these key natural resources." However, what is presented in section 10.2 Water Resources, is not what section 10.1 Introduction states that it is.

The *Background Report*, and the *California Water Plan* upon which it is based, provides broad regional information about the Tulare Lake Hydrologic Region, which in addition to Tulare County includes most of Fresno County, all of Kings County, and the western two-thirds of Kern County. It is essentially an extract of the *California Water Plan*.

While it is useful and important to provide a regional setting when conducting an analysis of water resources, all of the analyses of projected water usage and availability are based on the large regional analysis conducted by the state (other than one table of irrigation districts in the county based on data in a 36-year-old report [cited as Bookman-Edmonston Engineering, 1972]).

## **Misleading Local Conclusions by Reliance on Regional Analysis**

Relying on an overly broad regional view of water resources can lead to misleading conclusions on a local level. For example, the Water Resources section of the *Background Report* concludes with tables presented in the "Water Use Summary" subsection. Tables 10-7 and 10-8, Tulare Lake Basin Average Year and Drought Water use, respectively, list urban, agricultural, environmental, and total water usage for 1995 and projected for 2020.

Face-value inspection of average year water use indicates 13,100 thousand acre-feet used in 1995 decreasing to 12,900 thousand acre-feet in 2020. While this projection is good news for the Tulare Lake Hydrologic Region as a whole, the local story for Tulare County is not so rosy.

Closer inspection shows that there is a projected increase of 409 thousand acre-feet (59% increase) in urban water usage, which is offset by a projected decrease of 613 thousand acre feet (6% decrease) in agricultural usage. However, the decrease in agricultural usage is largely due to the anticipated retirement of land in western Fresno and Kings counties. And of course, the largest portion of the increase in urban water usage would be expected to occur in the populated eastern portion of the Basin including Tulare County.

Therefore, if the projections were less generalized and focused on impacts to Tulare County, they would show a projected deficit. This is because a decrease in pumping in the confined aquifer on the west side of the Valley would not be expected to compensate for increased urban usage in the county, especially for the unconfined aquifer from which most of the populated areas of Tulare County obtain their water.

## **Incorrect Conclusion Regarding Groundwater Supplies**

In discussing the 820,000 acre-feet per year of overdraft in the Tulare Lake Basin, the Water Resources section concludes that "this overdraft is due to reductions of surface supplies in recent years by Delta export restrictions, Endangered Species Act requirements, and other factors."

While there is no arguing that decreases in imported surface water supplies have exacerbated the overdraft, the Basin and Tulare County have been in overdraft since long before imported surface water

Mr. David Bryant  
April 14, 2008  
Page 3

supplies were made available. The simple fact is that we have been mining our groundwater by pumping and using more than can be sustainably replenished. The quoted conclusion appears to be a political opinion, not a statement of scientific fact.

Tulare County has been conducting non-sustainable mining of its groundwater since development began in the second half of the 19<sup>th</sup> century. Water table elevations declined between 41 and 100 feet between 1860 and 1961 in the unconfined aquifer beneath Tulare County (Williams and others, 1989). Greater declines were experienced in the lower confined aquifer resulting in the well documented significant land subsidence in the Tulare to Wasco area.

A recent study conducted on the Kaweah River Watershed for the Kaweah Delta Water Conservation District (KDWCD) determined that 413,000 acre-feet were mined between 1981 and 1999, representing a loss of 17% of the total groundwater in storage (KDWCD, December 2003; revised July 2007).

A hydrograph of a water supply well in the City of Visalia was included in Appendix C of the *Background Report* (a copy is attached to this letter for reference). The hydrograph shows a declining static water level (non-pumping) trend from 50 feet below ground surface (bgs) in 1986 to 100 feet bgs in 2005. A hydrograph of this well included in the KDWCD report shows water levels back to 1945, which display a declining trend from original depths of 20 to 30 feet bgs in the 1940s.

#### **Water Resources Report in Appendix C of Background Report**

This document provides a much more detailed analysis of the four valley watersheds and the foothill mountain region of Tulare County.

Much of the information in this document should have been included in water resource summaries contained in the other General Plan documents. For example, the following information from Appendix C should be included in water resource summaries of the main General Plan documents including the *Goals and Policies Report* and the DEIR:

##### **Kings River Watershed**

- *The static levels of groundwater within the Kings River Watershed exhibit a gradual decline, with time.*
- *There are no communities which are not impacted, to some degree, by either naturally occurring or man-induced contamination within this watershed.*

##### **Kaweah River Watershed**

- *While the easterly unit showed approximate balance, computations utilizing different methodologies showed that the overall underground reservoir was overdrafted at a level of between 17,000 [revised to 21,700 in the July 2007 revision] to 36,000 acre-feet per year. Groundwater trend information for the City of Visalia area is presented on Figure 4-8. As can be seen from an analysis of this figure, the static groundwater trend is ever decreasing, as is the corresponding quantity of water being held in storage in the groundwater reservoir.*
- *Lands immediately adjacent to foothills exhibit elevated chloride and nitrate characteristics. As groundwater is tapped toward the central portion of the valley floor of the County, the water normally produced is of excellent quality. Anomalies occur where man-induced contamination has adversely influenced the quality characteristics. Influences from nematodecides such as DBCP, herbicides, pesticides and fertilizers all appear at certain locations within the Kaweah River Watershed, as do the impacts from industrial chemicals such as dry cleaning solvents and petroleum fuels.*

Mr. David Bryant  
April 14, 2008  
Page 4

## **Tule River Watershed**

- [No analysis of groundwater trends were included in the document for the Tule River Watershed. The document should be revised to include this section.]
- *The east side of the valley floor in the Tule River Watershed contains the highest population of individuals impacted by lower quality groundwater of any area within the County. From the foothill fringe, adverse groundwater quality extends into the valley floor for several miles in all locals, except for those immediately adjacent to the Tule River.*

## **Deer Creek/White River Watershed**

- *The maintenance of the groundwater reservoir through this area is dependent, as previously noted, on the continued capability to have available surface water sources available for delivery into the area.*
- *The groundwater quality characteristics appurtenant to the Deer Creek/White River Watershed vary from east to west. In general, water quality on the east side of the valley floor of the County in this area is characterized by diminished quality where nitrates, phenols and salts are present in different concentrations and in different locals. On the westerly side of the Deer Creek/White River Watershed, groundwater quality again declines into unacceptable conditions. Principal among these conditions are elevated levels of arsenic and microsand conditions requiring special drilling techniques and/or well head treatment to allow compliance with applicable standards. Many of these wells produce various gases including hydrogen sulfide, methane and natural gas, further aggravating the capability to deliver a potable supply.*

## **Analysis of Anticipated Change of Status over Planning Horizon is Incomplete**

The Appendix C report states that "This overview includes the status of each of the major sources and any anticipated change in status over the planning horizon covered by the General Plan update." However, there is no analysis of potential impacts due to, and planning needed to address Global Climate Change.

The document includes a good overview on the San Joaquin River restoration litigation and its possible implications to Tulare County water resources. However, this section concludes by stating that:

*There is no possible way of providing an estimate of those impacts at the current time other than to indicate that both settlement and an adverse court decision will considerably modify the status quo.*

But a few paragraphs before is the statement:

*Information contained in the Expert Report of Richard M. Moss, P.E., in his representation of the Friant Division contractors in the referenced litigation provides estimates of the degree to which water deliveries could be potentially reduced to County lands as a result of a decision to provide flows for San Joaquin River restoration purposes.*

Why is there "no possible way" to estimate the impacts if there are specific estimates of potential water delivery reductions in the Moss report? Specific estimates of potential impacts to available water supply should be prepared based on available data to provide the information needed to plan for future growth in Tulare County.

## **Goals and Policies Report – Water Resources**

The introduction to *Section 11. Water Resources* states "The policies in this element should not be construed to insert the County into the allocation or management of water resources." This is in direct conflict with several of the implementation measures which state that the County shall take a lead role in management such as WR-1.8 and WR-3.2. Perhaps removing the word "management" from this

Mr. David Bryant  
April 14, 2008  
Page 5

sentence would resolve the conflict, but leave the ostensible intent of clarifying that the County does not have regulatory authority over the allocation of water resources.

A number of the policies lack implementation measures. Without effective implementation measures, stated policies are just well-intentioned platitudes without much chance of being realized.

All of the policies and implementation measures should be reviewed and rewritten as necessary to promote "sustainable" water resources in Tulare County. This means not contributing to the groundwater overdraft and not approving new projects with the hope of obtaining unknown or undefined surface water imports at some time in the future. Additionally, planning for the potential impacts of Global Climate Change should be included in the water resource policies and implementation measures.

The Existing Conditions Overview should be revised as needed subsequent to completion of the necessary updating and revisions to the *Background Report*.

## 11.1 General

### **WR-1.1 Groundwater Withdrawal**

There are not adequate implementation measures for this policy. While Implementation Measure 1 is listed as implementing this policy, it specifically addresses an ordinance "permit process for groundwater export." This implementation measure is applicable to policy *WR-1.3 Water Export Outside the County*, which is not listed as a policy this measure implements.

A similar implementation measure and ordinance should be required to address new wells and groundwater extraction within the County.

### **WR-1.2 Groundwater Monitoring**

Use of the terminology "The County shall support the collection of monitoring data..." should be changed to "The County shall require the collection of monitoring data..."

Implementation Measure 5 should require groundwater monitoring "for facilities or uses that are potential sources of groundwater pollution as part of project approvals..."

Implementation Measure 9 states that the "County shall seek cooperation from realtors to require all sales of homes to have water testing for nitrates and bacteria in addition to valley sites testing for DBCP and mountain sites for radiological contamination." Instead, the County should develop an ordinance requiring testing of all new domestic wells, and of domestic wells upon sale of existing homes. The County should require that the Environmental Health Department develop a list of contaminants of concern by location in the County and that the wells be tested for these contaminants.

### **WR-1.3 Water Export Outside County**

Use of vague and undefined criteria such as use of the word "substantially" in "Find and determine that the extraction will not substantially increase the overdraft of the groundwater underlying the County" significantly limit effectiveness of the proposed ordinance. No export should be allowed that would cause any contribution to overdraft.

Issuance of permits for groundwater export should be for relatively short time periods and should require a reevaluation of permit conditions and findings for renewal.

### **WR-1.4 Conversion of Agricultural Water Resources**

This policy should be rewritten to replace "discourage" with "prohibit the transfer of water used for agricultural purposes..." This important policy lacks implementation measures.

Mr. David Bryant  
April 14, 2008  
Page 6

**WR-1.6 Expand Use of Reclaimed Water**

This policy lacks any implementation measures.

**WR-1.7 Collection of Additional Groundwater Information**

This policy is vague and should include language regarding collection of data relating to both water supply and quality. Further, information collected should be made readily available to County residents via County websites.

**WR-1.8 Groundwater Basin Management**

This is a good policy, but the policy and Implementation Measure 11 seem to be in conflict with the statement in the section Introduction referenced above that the "policies in this element should not be construed to insert the County into the allocation or management of water resources."

**WR-1.9 Collection of Additional Surface Water Information**

This policy lacks any implementation measures. Information collected should be made readily available to County residents via County websites.

**WR-1.10 Channel Modification**

This policy should be modified to:

*Channel modification shall be discouraged prohibited in streams and rivers where it increases the rate of flow, rate of sediment transport, erosive capacity, ~~have has~~ adverse effect on aquatic life or ~~modify necessary groundwater recharge~~ reduces groundwater recharge.*

Implementation Measure 13 should be changed from "Stream crossing points should involve a minimum disturbance to banks..." to "Stream crossing points shall be designed to minimize disturbance to banks..."

**11.2 Water Quality**

**WR-2.1 Protect Water Quality**

This is a very important policy, however, the terminology "all major land use and development plans" is vague and must be concisely defined. This policy should also be implemented for all projects in known sensitive areas (e.g., as identified under policy WR-3.9).

While there is some overlap in implementation measures for other policies, there is no specific measure to implement this policy.

**WR-2.2 National Pollutant Discharge Elimination System (NPDES) Enforcement**

Implementation Measure 15, which addresses waterway flood control design, lists WR-2.2 as the sole policy that this measure implements. Was this meant to address policy WR-1.10?

**WR-2.3 Best Management Practices (BMPs)**

In addition to construction and urban runoff, this policy should include runoff from industrial and agricultural sites (especially from confined animal feeding operations).

**WR-2.5 Major Drainage Management**

Suggest modifying this policy to:

Mr. David Bryant  
April 14, 2008  
Page 7

*The County shall continue to promote protection of each individual drainage basin within the County based ~~in the basins~~ on each basin's unique hydrologic and use characteristics.*

There are no implementation measures for this policy.

**WR-2.6 Degraded Water Resources**

This policy should be changed to:

*The County shall ~~encourage and support the identification of~~ identify degraded surface water and groundwater resources and promote restoration whenever ~~where appropriate~~ feasible.*

There is no specific implementation measure for this policy.

**WR-2.7 Industrial and Agricultural Sources**

This policy should be changed to:

*The County shall ~~work with~~ require to its fullest regulatory authority that agricultural and industrial concerns ~~to ensure that water contaminants and waste products are handled in a manner that protects the long-term viability~~ prevents degradation of water resources in of the County.*

The only implementation measure for this policy is 16, which is limited to consideration of expanding the role of the Water Commission to "examine contaminant management." Stronger implementation measures should be developed.

**WR-2.8 Point Source Control**

There are no implementation measures for this policy.

**WR-2.9 Private Wells**

Suggest modifying this policy to:

*The County shall ensure that private wells are adequately constructed to provide protection from bacteriological and chemical contamination and do not ~~provide~~ create a potential groundwater contamination hazard ~~as to contaminate the aquifer~~.*

**11.2 Water Supply**

**WR-3.1 Develop Additional Water Sources**

There are no implementation measures for this policy. Likely, the greatest source of additional water will be realized from conservation measures. Rather than simple "promotion of water conservation programs," the County should develop ordinances requiring significant water conservation in new developments and provide incentives for retrofitting existing development. These should include, but not be limited to:

- Installation of water meters and implementation of tiered pricing
- Installation of low-flow toilets, shower heads, water faucets, etc.
- Water conserving irrigation and usage requirements
- Water conserving landscaping

Some of these measures are included in Implementation Measure 10. Policy WR-3.1 should be included in the policies that are implemented by this measure.

Mr. David Bryant  
April 14, 2008  
Page 8

**WR-3.2 Develop an Integrated Regional Water Master Plan**

This is a good policy, but the policy and implementation measures seem to be in conflict with the statement in the Introduction referenced above that the "policies in this element should not be construed to insert the County into the allocation or management of water resources."

Implementation Measure 3 should assure that watershed planning includes a balance of all water demands including environmental and rural in addition to agricultural and urban demands.

**WR-3.3 Adequate Water Availability**

This is an excellent and important new policy, however, Implementation Measure 19 should be strengthened to:

*The County shall adopt an ordinance to require new development proposals to provide suitable evidence of adequate and sustainable long-term water availability or will serve letter prior to approval of the tentative map or other entitlement. For subdivisions proposing to use well water, the new ordinance shall eliminate current waiver provisions and require well pump tests aquifer testing, including long-term pumping tests, conducted by a qualified Professional Geologist or Engineer, to demonstrate water supply capabilities. The aquifer testing report must include a professional opinion that proposed extraction from the new well will be sustainable, will not contribute to groundwater overdraft, and must consider cumulative and regional impacts.*

Simply stating that "well pump tests" be conducted is not adequate as this could be interpreted to mean short-term tests (commonly referred to as "Edison" tests) that would not yield information on the sustainability of the water supply.

**WR-3.4 Water Resource Planning**

Water resource planning should include evaluation of, and planning for, potential impacts due to Global Climate Change.

**WR-3.5 Uses of Native and Drought Tolerant Landscaping**

This policy should be changed to:

*The County shall encourage the use of low water consuming, drought-tolerant and native landscaping and ~~emphasize the importance of utilizing~~ develop an ordinance requiring utilization of water conserving techniques, such as night watering, mulching, and drip irrigation.*

Implementation Measure 10 should be modified to include a water conservation ordinance mandating irrigation schedules, draining or filling of pools by permit, no hosing down sidewalks or driveways, etc. This implementation measure should also be modified to require installation of water meters and tiered billing within the County's regulatory authority.

**WR-3.6 Agricultural Irrigation Efficiency**

There is no specific implementation measure for this policy.

**WR-3.10 Diversion of Surface Water**

This is a good policy, but is rendered vague by the terminology "needed groundwater recharge." How is this determined? Perhaps this should be defined as part of policies WR-3.2 and/or WR-3.9. There are no implementation measures for WR-3.10.

Mr. David Bryant  
April 14, 2008  
Page 9

## Draft Environmental Impact Report – Water Resources

The DEIR does not include discussion and analysis of potential impacts to water resources due to Global Climate Change. The DEIR concludes that there is "no feasible mitigation available" for two of the four identified impacts, yet a number of policies are included in the *Goals and Policies Report* which may provide mitigation if properly implemented. Three of the four identified impacts are expected to cause "significant and unavoidable" impacts to the water resources of Tulare County due to implementation of the policies in the General Plan Update.

The authors of the DEIR need to conduct additional analysis in conjunction with the proposed revisions to the *Background Report* and *Goals and Policies Report* to identify appropriate mitigations to these impacts to provide sustainable water resources for Tulare County. To simply state they are significant and unavoidable with no mitigation measures available is unacceptable.

**Impact WR-1: The General Plan Update would require or result in the construction of new water treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects.**

Impact WR-1 indicates that new facilities that may need to be constructed "could include water treatment facilities, pipelines, pump houses, wells, etc." Construction and extraction of groundwater from new wells will potentially further exacerbate the groundwater overdraft in the County. This is not discussed in the impact analysis or addressed in the mitigation measures.

**Impact WR-2: The General Plan Update would require new or expanded water supply entitlements.**

The impact analysis finds:

*Implementation of the General Plan Update would result in additional County-wide residential and non-residential land use developments. These land uses and development consistent with the General Plan Update would increase the demand for water and, in some cases, result in insufficient water supplies available to serve some of the unincorporated areas designated for urban development from existing entitlements. New or expanded entitlements would be required.*

Additionally, the impact analysis finds:

*As a result, this analysis of the adequacy of future water supplies is based upon whether or not there is a reasonable likelihood that public water suppliers will be able to successfully bring future water supplies on line where it is necessary to serve their respective districts.*

Impact analysis focuses on infrastructure improvements by twenty unincorporated communities for treatment of contaminated water supplies or improved storage and delivery of water. However, the analysis does not address the decreasing availability of water county-wide caused by continued overdraft, decreasing availability of imported surface water supplies, and issues related to Global Climate Change.

The DEIR concludes there is "no feasible mitigation available" for this impact and that it will result in "significant and unavoidable" impact to the water resources of the County.

Mitigation of this impact should include a policy not to approve any development in the County unless the project provides evidence that adequate and sustainable water is available without further exacerbating overdraft conditions. This would be consistent with policy WR-3.3.

Mr. David Bryant  
April 14, 2008  
Page 10

**Impact WR-3: The General Plan Update would have the potential, in the long-term, to deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table.**

The impact analysis finds:

*Implementation of the General Plan Update would result in an increased demand on groundwater supplies for urban and rural uses within the unincorporated areas of the County. Due to the lack of comprehensive information regarding the County's groundwater resources, it is uncertain if groundwater supplies would be sufficient to meet the future demand of rural private domestic, small municipal and agricultural wells.*

*In some of the unincorporated urban development areas, there are concerns that adequate water supplies cannot be achieved through sustainable groundwater management, that is, without creating declining groundwater levels, and adversely affecting existing wells. Such concerns are heightened by the fact that most of these areas are presently dependent upon groundwater supplies.*

There is more than enough information in the *Background Report* and available elsewhere in published reports to conclude that current water usage is not sustainable and has resulted in long-term overdraft of groundwater in the County. Certainly if the County is not meeting its current needs, future demand will only exacerbate the situation.

While the *Goals and Policies Report* provides a number of policies that would help mitigate this impact, the DEIR concludes there is "no feasible mitigation available." Mitigation of this impact should include a policy not to approve any development in the County unless the project provides evidence that adequate and sustainable water is available without further exacerbating overdraft conditions. This would be consistent with policy WR-3.3.

Other mitigations should include the provisions of WR-1.1, as modified above, mandatory water conservation measures, and all of the WR-3 policies as modified above.

**Impact WR-4: The General Plan Update could violate water quality standards or waste discharge requirements, or otherwise degrade water quality.**

The DEIR finds that this impact is "less-than-significant" with "no mitigation required." However, this was based on a fatally flawed impact analysis. The impact analysis only considered surface-water runoff, but did not consider potential exacerbation of widespread groundwater contamination due to increased demands, potential contamination from agricultural operations, especially confined animal feeding operations, and other sources.

The DEIR does find that "Water quality impacts may also be significantly greater during the rainy season," but offers no analysis or proposed mitigation measures. Much more work needs to be conducted on this impact.

## **Global Climate Change**

As stated previously, none of the General Plan documents (*Background Report*, *Goals and Policies Report*, nor DEIR) address the potential impacts of Global Climate Change on the water resources of Tulare County. It would be irresponsible not to include planning for the potential effects of Global Climate Change in these essential planning documents.

It is the overwhelming consensus of researchers that Global Climate Change will likely cause profound changes to precipitation patterns affecting Central California and significant decreases in the Sierra snowpack. The California Department of Water Resources estimates "the potential loss of 5 million acre-feet or more of average annual water storage in the State's snowpack" (DWR, July 2006).

Mr. David Bryant  
April 14, 2008  
Page 11

It is recommended that the County review available information and published reports from the California Department of Water Resources and other sources and revise all of the General Plan documents and DEIR to address and plan for the potential impacts of Global Climate Change on the water resources of Tulare County.

Sincerely,

Kimball R. Loeb  
Professional Geologist No. 5865  
Certified Hydrogeologist No. HG 121  
Certified Engineering Geologist No. EG 1945

## Mineral King Group Kern-Kaweah Chapter

April 14, 2008

David Bryant, Project Planner  
Tulare County Resource Management Agency  
Government Plaza  
5961 South Mooney Boulevard  
Visalia CA 93277

Re: Tulare County General Plan Update and DEIR

Dear Mr. Bryant:

The Sierra Club Mineral King Group include members throughout Tulare County. We submit these comments and recommendations on the General Plan Update and DEIR.

### Scenic Landscapes

The scenic landscapes element acknowledges that our county possesses many of California's most unspoiled places and presents goals and policies that reflect our values. Unfortunately, it falls short on effective implementation.

SL-1.1 is a policy to *require new development to not significantly impact or block views of natural landscapes* and the implementation for this policy is that the County shall adopt procedure criteria. This is vague and we have a right to know what the criteria are. The DEIR states the GP Update will *substantially degrade the existing visual character and no other feasible mitigation available*. We disagree and submit this mitigation measure as procedure criteria for the County to adopt: The County shall adopt a tree ordinance to protect the visual beauty of this resource. This mitigation is feasible because the City of Visalia has adopted an oak tree ordinance and it is evident throughout the city.

SL-1.3 is a policy to protect watercourses. It did not mention rivers, creeks and streams. These are natural landscapes and must be included. Implementation measures were not listed, so we will submit one: The County shall require a 30-ft or more setback from waterway channels; width of the setback shall depend on the presence of riparian habitat and shall include the riparian habitat. This mitigation is feasible because the City of Visalia has adopted such a standard. Many cities in California, including the City of Visalia, made the mistake of paving over their waterways many decades ago and are now recognizing that these are valuable community resources. Protecting this resource is an asset to the health and wellness of a community's residents. Natural open space and parks along waterways is a scenic respite from the urban structure. Hiking and walking trails along waterways offers aerobic fitness and is much more scenic than a going-nowhere treadmill in a tasteless gym.

SL-2 is a goal to *protect the scenic views for travelers along the County's roads and highways*. Policy SL-2.1 is to formalize a system of County scenic routes and says to see

P.O. Box 3543, Visalia, CA 93278  
[www.mineralking.sierraclub.org](http://www.mineralking.sierraclub.org)

Attachment 4-3

Figure 7.2-1. There is no Figure 7.2-1 in the report. The closest thing to Figure 7.2-1 is Figure 7.2 in the Background Report and is a map of solid waste facilities - not very scenic.

The value of scenic corridors is additionally recognized in the Foothill Growth Management Plan as FGMP-6 to protect scenic routes within the foothills. Several policies are stated to achieve this goal.

FGMP-6.1 is a policy to protect scenic roads against obtrusive development. The policy refers to the FGMP adopted in 1981, which describes some implementation measures. The current version of the FGMP does not state any so we offer this one: New towns or a Planned Community Area (PCA) shall not be allowed within scenic corridors. These types of massive developments with shopping centers and industrial operations are obtrusive.

FGMP-6.2 is a policy for the County to identify scenic routes. Without a doubt, Yokohl Drive through Yokohl Valley is a scenic route.

FGMP-6.3 is a policy *that development along all scenic highways and routes meet the development standards of this FGMP*. Which development standard is the FGMP referring to? The 1981 version identifies a few building standards and scenic corridor standards, but the development standards in the Appendix of the current version refer only to fire protection. The FGMP is very confusing and convoluted. There should be a discussion on which implementation measures from the 1981 version still apply.

We would also like to point out that the FGMP identified development corridors - areas in the foothills where development may occur and will be guided by the PD-F zone. Four development corridors were identified: 1) Badger/Elderwood 2) Kaweah River 3) Tule River 4) Round Valley.

Another point on page 3-3 of the FGMP, a statement in the first paragraph reads *"it is the policy of the FGMP to strengthen the community identify of Springville, Lemon Cove and Three Rivers; therefore, most retail commercial is limited to those existing communities rather than areas outside these communities"*.

These two points support our proposed implementation measure that new towns or PCA's shall not be located within a scenic corridor.

## **Air Pollution**

It is common knowledge that air pollution in the San Joaquin Valley is quite dreadful. As a reminder, our air basin is classified extreme non-attainment for ozone and the EPA requires a plan to meet the standards of the federal Clean Air Act by the year 2010. Failure to demonstrate achievement of the standards could lead to denial of federal funding and permits for highway construction and sewage treatment plants. This could result in economic disruption for our county because businesses will not or cannot locate here.

In response to the extreme non-attainment, the Board of Supervisors adopted Resolution 2002-0157 in 2002, requiring the County to commit to implementing Reasonably Available Control Measures (RACM). Some of these are good, such as increasing transit service to the

unincorporated communities of Woodville, Poplar and Cotton Center; supporting the purchase of hybrid vehicles for the County fleet. The Board followed up with another resolution in 2004, Resolution 2004-067, with additional RACM such as *the development and implementation of recommended procedures, thresholds, and policies related to land use projects to help achieve air quality goals.*

We recommend it is now time for the Board of Supervisors to adopt an updated resolution that the County will commit to implementing the Best Available Control Measures (BACM). This new resolution should include expanding transit service to all growth communities, purchasing clean-burning buses, and developing concise, effective procedures to achieve air quality goals.

As written, the DEIR is inconsistent with the Goals and Policies Report and the GPR is internally inconsistent. For example, the DEIR states that *best available controls* will be implemented to regulate air emissions (Impact AQ-2, p. 4-55), referring to policies AQ-4.1 through AQ-4.5 in the GPR. However, AQ-4.1 actually states that BACM and RACM will be applied. Additionally, AQ-4.1 is inconsistent with its stated goal (AQ-4), which is to *implement the best available controls and monitoring necessary to regulate air emissions.* Thus it is also inconsistent with the Board of Supervisors outdated resolutions. A new, updated resolution can be based on specific thresholds. For instance, projects with potentially significant emissions should be analyzed and those that trigger an agreed threshold will be required to implement BACM.

The DEIR presents an inadequate analysis of indirect source review for new development directed into all the UDBs, HDBs, UABs, SOIs, New Towns, Urban Corridors, Highway Corridors, Regional Growth Corridors, and Foothill Growth Corridors. It presents an inadequate discussion of the cumulative impacts resulting from the General Plan Update. The data presented only refers to on-road vehicle and dairy/feedlot emissions. The DEIR should present a summary of the types of sources of air pollution. These would be industrial sources such as factories and power plants; mobile sources including off-road; area sources such as construction and landscaping activities; and residential sources such as energy consumption. Concurrent to this, the DEIR should present an inventory of emissions produced by each type of source.

While many projects will be subject to the ISR rule adopted by the San Joaquin Valley Air Pollution Control District (SJVAPCD), the rule will only offset about half the air pollution associated with the project. Given that our air basin must attain federal standards by 2010, the Plan should include a goal to reduce new projects air pollution impacts to zero. A BACM implementation to achieve this could be a requirement for all new projects to come to an agreement with the SJVAPCD to completely offset the air pollution associated with the project. A number of developers in Bakersfield (the West Ming project and the Old River Ranch project) have agreed to participate in an Emissions Reduction Program through the SJVAPCD. This program utilizes techniques such as onsite design features and offsite pollution reduction projects to completely offset the emissions associated with the project. Such participation is validation that this mitigation measure is feasible. The DEIR should include an evaluation of such a program.

Additionally, a recent article in the Fresno Bee, published 2/22/08, reports that a Fresno County judge has upheld a fee imposed on developers to pay for pollution caused by traffic

coming from new homes and businesses built on sprawl. The ruling allows the Air District to raise millions of dollars to invest in clean air projects, such as replacing diesel buses and street sweepers. The fee can be reduced if developers offset the emissions associated with their project...more reason for implementing an Emissions Reduction Program. These fees could be a benefit to the County, which can be used to uphold your 2002 Resolution for increased transit service and purchasing hybrid vehicles.

## **Global Warming**

The DEIR acknowledges the GP Update will significantly conflict with state AB32 goals to reduce greenhouse gas (GHG) emissions. It offers an analysis of CO2 emissions from on-road vehicles and methane from dairy and feedlot operations. However, it fails to provide a systematic analysis of other sources of GHGs such as electric generation facilities, gas generation facilities, waste facilities, cement manufacture, residential and commercial.

The DEIR presents two new policies AQ-4.7 and AQ-4.9 as mitigation measures to reduce GHG. The two new policies are not included in the Goals and Policies Report (GPR). We request these policies be officially incorporated into the GPR. AQ-4.9 is a Greenhouse Gas Emissions Reduction Plan. It is merely a policy that states the County will do what it is already required to do by AB32. The DEIR defers action by stating that projects, which will contribute significant CO2 emissions, have not been defined. Deferring action (i.e. implementation/mitigation measures) is not acceptable under CEQA. For instance, the DEIR lists policies on energy conservation (ERM-1 through ERM-4.6) that are designed to address GHG impacts, yet implementation measures were not stated.

The Goals and Policies Report is inadequate in offering sufficient goals and policies for the reduction of greenhouse gas emissions. We request the GPR contain a separate goal that GHG associated with new projects shall be objectively quantified and completely mitigated. There are a number of policies and implementation measures that could serve as project-specific mitigation. Some of these include:

- Green building measures, such as design buildings to be at least 15% more energy efficient than Title 24 standards.
- Solar energy measures, such as building solar photovoltaics and solar water heating into every structure.
- Water conservation and efficiency measures, such as create water-efficient landscapes, install water-efficient fixtures and appliances.
- Land use measures, such as incorporate mixed-use, infill, higher density developments into all new projects.
- Transportation and motor vehicle measures, such as designating a certain percentage of parking spaces for ride sharing vehicles.

The California Attorney General's Office has made available a document to help local agencies with mitigation measures that can be adopted to offset global warming impacts caused by the projects they permit. This document is available at <http://ag.ca.gov/globalwarming/ceqa.php>. Once the County determines which mitigation measures will be required, the General Plan Update EIR should address the effect that each of the mitigation measures will have on GHG impacts.

## Biological Resources

The DEIR has not fully considered all available options to mitigate GPU impacts to sensitive habitat (Impact ERM-1), riparian habitat (Impact ERM-2), wetlands habitat (Impact ERM-3) and therefore presents an inadequate analysis of project impacts:

ERM-1 is a goal to preserve and protect sensitive, significant habitat. Unfortunately, the policies supporting this goal are too broadly drawn and vague. Policy should be clear and solid, with well defined standards. Thus, mitigation can be measured against these standards. For instance, ERM-1.1, a policy for protection of rare and endangered species, should include a "no net loss" standard. It could be added to the current policy as written: "....., through compatible land use development that strives to avoid the net loss of important wildlife habitat." Thus the mitigation for this could be achieved through the use of conservation easements or mitigation banking.

Including the "no net loss" standard would also provide a process to measure mitigation for ERM-1.2, which is a policy to limit or modify development in environmentally sensitive areas. For instance, implementation measure #4 states *"Where avoidance is infeasible, the County shall.....limit the loss of habitat, including modification of the proposal"* and is just a restatement of the policy. It provides no real mitigation. We recommend strengthening this implementation measure to state "Where avoidance is infeasible, the County shall require mitigation at sufficient ratios to replace the function and value of the habitat that was removed or degraded. Mitigation can be adequately achieved through restoration, creation, or mitigation banking."

ERM-1.4, 1.5, 1.6, and 1.8 are policies to protect riparian areas and wetlands. Again, these policies should indicate well defined standards.

Remaining riparian habitat provide critical wildlife habitat and movement corridors. A policy with standards, such as stating "No mature riparian woodland is destroyed or reduced in size" is a clear, strong statement as to how mitigation can be measured. Or a policy similar to that of Fresno County General Plan, October 2000 (Policy OS-D.4) with buffer standards, which provide a clear, unambiguous process for implementation:

*"Policy OS-D.4 The County shall require riparian protection zones around natural watercourses and shall recognize that these areas provide highly valuable wildlife habitat. Riparian protection zones shall include the bed and bank of both low- and high-flow channels and associated riparian vegetation, the band of riparian vegetation outside the high-flow channel, and buffers of 100 feet in width as measured from the top of the bank of unvegetated channels and 50 feet in width as measured from the outer edge of the dripline of riparian vegetation."*

Remaining wetlands habitat is a State and federal concern, and includes policies for "no net loss". State policy include goals to achieve "net gain" in wetland acreage. ERM-1.6 is a weak policy and should be strengthened to state "The County shall support the preservation and management of wetlands to achieve no net loss of wetland acreage, function or value". Thus, a strong policy provides a solid base to establish concrete mitigation. Examples would

be avoidance of wetlands as the preferred, but where avoidance is not possible, mitigation would be to achieve a net gain in wetland habitat through restoration or creation.

The "no net loss" standard is feasible because numerous County General Plans, including Fresno County, include this standard. The GPR should be revised to include this standard and the DEIR should include a discussion and analysis of this standard.

ERM-1.8 is a policy for open space buffers but does not provide solid guidelines, specifically because it incorporates the word "should" in the buffer requirements. Changing the word "should" to "shall" and adding standards, such as the Fresno County Policy OS-D.4, will strengthen the policy.

Many of the policies (ERM-1.1, ERM-1.4, ERM-1.5, ERM-1.6, and ERM-1.8) will be carried out through the Zoning Ordinance (Implementation Measure #7 and #8). Implementation Measure #7 is not true mitigation. It is merely a technicality to update the Zoning Ordinance with the Resource Conservation (RC) designation for those areas that are already parks or preserves (i.e. Sequoia/Kings Canyon NP, Blue Ridge NWR) and as new parks or preserves are added. Additionally, this designation is vague because the description for RC (GPR page 5-8) is in the foothill and mountain regions, which leaves out many preserves on the Valley floor (i.e. James K. Herbert Wetlands Preserve, Pixley NWR, etc.).

The DEIR is deficient in discussing how the Zoning Ordinance will protect sensitive, significant habitat and does not quantify how new requirements will mitigate GPU impacts. It does not provide any information to the general public on the adequacy of mitigation that will be incorporated in the Zoning Ordinance (Implementation Measure #8).

In practice, the Zoning Ordinance is undesirable as a means to implement mitigation unless the standards are clearly defined in the General Plan. Mitigation measures must be transparent and available for public review. An acceptable implementation measure would be to prepare a Waterways, Open Space, Wetlands/Riparian or similar Ordinance in conjunction California Department of Fish and Game, U.S. Fish and Wildlife Service, U.S. Army Corps of Engineers, other stakeholders, interested citizens; and then submitted for public hearing as a separate process.

Thank you for consideration of our comments that we believe, are reasonable and flexible and can be incorporated into the General Plan Update.

Respectfully submitted,

Mary Moy  
Conservation Chair  
Sierra Club Mineral King Group

### **Significance Conclusion**

Due to the soil quality coupled with the availability of irrigation water at the proposed Project site, the Project site is considered prime farmland; therefore, conversion of the site to nonagricultural use would be a significant impact.

### **Mitigation Measures**

**MM 4.2-1:** Prior to issuance of a grading or building permit, whichever occurs first, the applicant shall provide written evidence of completion of one or more of the following measures to mitigate the loss of agricultural land at a ratio of 1:1 for net acreage before conversion. Net acreage is to be calculated based on excluding existing roads and areas already developed with structures. A plot plan shall be submitted substantiating the net acreage calculation along with written evidence of compliance:

- Funding and/or purchase of agricultural conservation easements (will be managed and maintained by an appropriate entity);
- Purchase of credits from an established agricultural farmland mitigation bank;
- Contribution of agricultural land or equivalent funding to an organization that provides for the preservation of farmland in California; or
- Participation in any agricultural land mitigation program adopted by Kern County that provides equal or more effective mitigation than the measures listed above.

Mitigation land shall meet the definition of prime farmland or farmland of statewide importance established by the State Department of Conservation. Completion of the selected measure, or with the Planning Director's approval, a combination of the selected mitigation measures, can be on qualifying land within the San Joaquin Valley (San Joaquin, Stanislaus, Merced, Fresno, Madera, Kings, Tulare, or Kern County) or outside the San Joaquin Valley with written evidence that the same or equivalent crops can be produced on the mitigation land.

### **Level of Significance after Mitigation**

Impacts would be significant and unavoidable.

*Attachment 44*

## SETTLEMENT AGREEMENT AND RELEASE

This Settlement Agreement and Release ("Agreement") is made this 11<sup>th</sup> day of May, 2007, by and between the Sierra Club, a California nonprofit corporation ("Sierra Club"), and the City of Bakersfield and the City Council of the City of Bakersfield, (collectively, "City"), Keith Gardiner, an individual, Jennifer Gardiner, an individual, Gardiner Family, LLC, a California limited liability company and Rosedale Farming Group, a California limited partnership (collectively, "Landowner"), (Sierra Club, City and Landowner are sometimes individually referred to herein as a "party" or collectively as the "parties").

This agreement is made with reference to the following facts and circumstances:

- A. Both Landowner and Sierra Club have an interest in preserving agricultural farm land.
- B. Landowner is the owner of real property depicted and described in Exhibit "A" ("Property"), and is developing said Property as a project within the City.
- C. The City Council of City, on November 16, 2005, approved General Plan Amendment and Zone Change GPA/ZC No. 04-0671 and adopted Resolution 267-05 approving and certifying a Final Environmental Impact Report in support of the General Plan Amendment and Zone Change ("EIR"), all of which conferred certain entitlements to development of the Property including, but not limited to, a development agreement between the City and Landowner.
- D. Sierra Club filed a Petition for Writ of Mandate in the Kern County Superior Court captioned *Sierra Club vs. City of Bakersfield* (Case No. S-1500-CVB-257073-RJO) ("Case") alleging, among other things, that the EIR is inadequate and not in compliance with the requirements of the California Environmental Quality Act (Pub. Res. Code Sec. 21000, et seq.) ("CEQA").
- E. The Kern County Superior Court has not rendered a decision regarding the matters contained in the Sierra Club's court filing and no judgment has been entered in the Case.
- F. The parties are mindful of the costs and uncertainty associated with further litigation and appeals and have conducted discussions that have led to a compromise resolution among them, and the parties desire to adjust, compromise, settle and satisfy all claims asserted among them, or which could have been asserted among them related to or arising from the matters released below.

NOW, THEREFORE, in consideration of the mutual promises hereinafter set forth and for other good and valuable consideration, the adequacy and receipt of which are hereby acknowledged, the parties agree as follows:

1. Covenant Not to Sue and Mutual Release

By entering into this Agreement, Sierra Club, Landowner, and City, each agree not to sue and hereby fully release and discharge one another, and any and all of their respective present and past officers, partners, agents, members, employees, elected officials, insurers, attorneys and representatives, with respect to any and all claims, demands, causes of action of any nature related to the City's approval of the project involving the Landowner and the Property described above that are based upon facts in existence prior to the date of this Agreement. The Release is also intended to include any claim or cause of action challenging any current or subsequent permits, approvals or entitlements granted or issued by the City or any other public agency necessary or related to the implementation of the terms of this Agreement or to the development and construction of the project substantially as approved, including, but not limited to, permits, approvals or entitlements allowing any non-material changes to the current zoning. This Release, however, is not intended to bar any claim, demand or cause of action or liability challenging any alleged failure to implement mitigation measures or comply with conditions of the Subdivision as approved, or challenging any subsequent approval of a material change to the project zoning. For purposes of this Agreement, a material change shall be any change which results in a significant change in the density of the Subdivision, in a significant increase in the severity of an environmental impact of the Subdivision, or in a new significant environmental impact of the Subdivision.

By execution of this Agreement, the parties hereto do hereby expressly waive any and all rights based upon the provisions of Section 1542 of the Civil Code of the State of California, which reads as follows:

"A general release does not extend to claims which the creditor does not know or suspect to exist in his favor at the time of executing the release, which if known to him, must have materially affected his settlement with the debtor."

The provisions of this Agreement do not affect Landowner's obligation to defend and indemnify the City as set forth in the conditions of approval for General Plan Amendment / Zone Change No. 04-0671 and Bakersfield Municipal Code Section 16.16.110.

2. Payment Obligations

- A. Landowner shall be responsible for paying an agricultural conversion fee (the "Fee") of \$2,500.00 per acre, as provided in and according to the fee schedule contained in Exhibit "B". Landowner shall have the right to assign the duty to make such payment to a subsequent owner of any portion of the Property, who will step into Landowner's shoes and would be responsible for making payments required by this Agreement. Regardless of any subsequent changes to the project or Exhibit "B," if any, appropriate payments to the Sequoia Riverlands Trust or its assignee or successor must be made by the Landowner

or Landowner's assignee.

- B. The Fee shall be paid to the Sequoia Riverlands Trust or its assignee or successor contemporaneous in time with the issuance of building permits. Funds can and will only be used for (i) acquisition of agricultural lands or agricultural conservation easements in Kern County and (ii) administration of the Sequoia Riverlands Trust, including but not limited to administrative overhead, salaries, educational activities, transaction costs, endowments, monitoring and enforcement of conservation easements.. In no event shall any of the fees be paid to, or used for the benefit of, the Sierra Club. The City shall not be obligated to monitor the Sequoia Riverlands Trust or its assignee or successor nor shall the City act as the keeper or holder of any of the funds placed in the Sequoia Riverlands Trust.
- C. Landowner shall pay Sierra Club's attorney's fees and costs in the amount of \$37,770.80 within ten (10) days of the execution of this Agreement.
- D. A transfer fee of one quarter percent (1/4 %) or a minimum of \$750.00, whichever is greater, shall be paid to the Sequoia Riverlands Trust or its assignee or successor each time a residential, commercial or industrial property that has been built is re-sold. The transfer fee shall be used for administration of the land trust, including but not limited to the following purposes: (i) acquisition of agricultural lands or agricultural conservation easements in Kern County and (ii) administrative overhead, salaries, educational activities, transaction costs, endowments, monitoring and enforcement of conservation easements. The fee shall be explained in detail as part of the project's Covenants, Conditions, and Restrictions (C.C.R.s), which shall be recorded. In addition, this agreement shall be recorded upon its execution. This fee shall be paid in perpetuity or for the longest period allowed by law.
- E. A one time administration fee of \$75,000.00 will be paid at the signing of this Settlement Agreement to assist in the administration of the land trust, which amount will operate as an offset against Landowner's total payment obligations under subsection A of section 2 of this Agreement.
- F. The payment provisions in Section 2, subdivisions (A) - (E) of this Agreement are subject to modification through the operation of the "essential parity conditions and covenants" discussed in section 3 of this Agreement, below.
- G. Sierra Club acknowledges that the obligations of Landowner under Section 2 of this Agreement are the obligation of Landowner only and not obligations of the City. Sierra Club therefore shall have no remedy of any kind and shall

neither initiate nor maintain an action against the City for breach of any of the provisions of Section 2 of this Agreement.

3. Essential Parity Conditions and Covenants

Sierra Club acknowledges that it is currently negotiating with Castle and Cooke on agricultural land preservation mitigation fees and measures in regards to Castle and Cooke's West Ming Project.

If Sierra Club and Castle and Cooke enter into an agreement concerning agricultural land preservation mitigation fees and measures for the West Ming Project ("West Ming Agreement") that requires Castle and Cooke to contribute a transfer fee that is lower than the transfer fee owed by Landowner under this instant Agreement, then the Sierra Club must negotiate in good faith to amend this instant Agreement to match, as nearly as possible, the lower transfer fee reflected in the West Ming Project.

If Sierra Club is unsuccessful in negotiations with Castle and Cooke and the West Ming Project and/or unsuccessful with any court action it might bring against Castle and Cooke regarding the West Ming Project, then any and all transfer fees under this Agreement as referenced in subsection D of section 2 of this Agreement are null and void.

The provision is intended by the parties to prevent this Agreement from placing Landowner's development project in an economically disadvantageous position where it faces agricultural land preservation burdens not equally shared by one of its key competitors, Castle and Cooke. In the event of a dispute concerning the meaning of this Agreement, it should be interpreted so that it is consistent with that end.

4. This Settlement Not an Admission

The parties agree that this Settlement and the settlement reached herein does not and shall not constitute or be construed in any manner or at any time as an admission or indication of any liability or obligation, or that the City's approval of the project or any process or procedure related thereto violates or violated any statute, ordinance or other requirement of law in any manner or respect whatsoever, or that any document relied on was deficient in any respect, or that any of the allegations in the suit providing any basis for the relief sought are true.

5. Litigation Fees and Costs

All parties shall be responsible for the payment of their own attorneys' fees, and all other expenses incurred in connection with the Agreement, any matter or thing respecting the claims made in the Agreement, and/or Settlement thereof, and this Agreement except for those Attorney's fees and costs agreed above.

6. The Parties' Exclusive Remedies

A. The Parties' and Sequoia Riverlands Trust or its assignee or successor's sole and exclusive remedy for breach of this Agreement shall be an action for specific performance or injunction. In no event shall any party be entitled to monetary damages for breach of this Agreement. In addition, no legal action for specific performance or injunction shall be brought or maintained until (a) the non-breaching party provides written notice to the breaching party which explains with particularity the nature of the claimed breach, and (b) within thirty (30) days after receipt of said notice, breaching party fails to cure the claimed breach or, in the case of a claimed breach which cannot be reasonably remedied within a thirty (30) day period, breaching party fails to commence and thereafter diligently complete the activities reasonably necessary to remedy the claimed breach.

B. The failure of the City or any other governmental entity with jurisdiction under applicable law to approve any action required to be taken pursuant to this Agreement which lies within the jurisdiction of the City or said governmental entity shall not constitute a breach of covenants contained in this Agreement with the sole exception that if LAFCO does not allow the project to be annexed into the City of Bakersfield the Agreement shall be null and void.

C. If the grounds for the Sierra Club's breach of this Agreement is an alleged initiation or joinder of a lawsuit, dismissal of the suit by or as to the Sierra Club shall constitute a complete cure. If the dismissal of the lawsuit does not occur within thirty (30) days of the receipt of the notice required by Section 6(a) above and litigation ensues, then the prevailing party shall be entitled to recover its reasonable attorney's fees and costs.

D. In the event a party breaches this Agreement and thereafter fails to cure the breach according to the terms of this Agreement, the non-breaching party shall be relieved of its obligations under this Agreement, and the release provided in paragraph 1 as to the non-breaching party shall terminate.

7. Representation and Warranty of Authority

Each individual signing this Agreement represents and warrants that he or she has the authority to execute this Agreement on behalf of the entity on whose behalf he or she signs and to bind and obligate such entity according to the terms and covenants of this Agreement.

8. Third Party Beneficiaries

No member of the Sierra Club nor any other person, other than the City, and the Sequoia Riverlands Trust or its assignee or successor shall be deemed a third party beneficiary of this Agreement, nor shall any such person have any right to bring any action in his or her individual capacity to enforce this Agreement

9. Severability

Each provision of this Agreement is intended to be severable. In the event any term or provision hereof is declared to be illegal or invalid, for any reason whatsoever, by a court of competent jurisdiction, such illegality or invalidity shall not affect the balance of the terms and provisions hereof, which terms and provisions shall remain binding and enforceable.

10. Voluntary Agreement

The individual signing this Agreement on behalf of the Sierra Club declares that he or she has read and understands this Agreement and warrants and represents that he or she executes this Agreement voluntarily and without duress or undue influence on the party of or on behalf of any party hereto. The individual signing this document on behalf of the Sierra Club hereby acknowledges that Sierra Club has been represented in negotiations and for the preparation of this Agreement by counsel of its own choice, that he or she has read this Agreement and has had it fully explained to him or her by said counsel, and that he or she is fully aware of the contents of this Agreement and of the legal effect of each and every provision hereof. Said person represents and warrants that execution and delivery of this Agreement has been duly approved according to the Bylaws and/or applicable rules governing the conduct of the business of the Sierra Club.

The Sierra Club agrees that upon the execution of this Agreement it will within three (3) business days file a dismissal with prejudice in Kern County Superior Court of that certain case entitled Sierra Club vs. City of Bakersfield (Case No. S-1500-CVB257073-RJO).

11. Entire Agreement

This Agreement contains the sole and entire agreement and understanding to which Sierra Club, Landowner and the City are parties with respect to the subject matter hereof, and any and all prior discussions, negotiations, commitments or understandings related hereto, if any, are hereby merged herein. No representations, oral or otherwise, expressed or implied, other than those contained herein have been made by any party hereto with respect to the matters contained herein.

12. Counterparts

This Agreement may be executed in one or more counterparts, each of which shall be deemed an original agreement, but all of which together shall constitute one agreement.

13. Delivery of Signature Page by Facsimile or E-Mail Transmission

The parties agree that this Agreement will be considered signed when the signature of a party is delivered by (1) execution of an original, (2) facsimile transmission of a signed signature page, or (2) e-mail transmission of a signed and scanned signature page. Such facsimile or e-mail signature shall be treated in all respects as having the same effect as an original signature.

IN WITNESS WHEREOF, the parties have executed this Agreement as of the date first above written.

## AGRICULTURAL LAND CONSERVATION TOOLS

Pros and Cons

Categories	Pros	Cons
<b>Land Use Planning Tools - City Growth Strategies</b>		
1 Increased Urban Development Densities/Density Bonuses	Incentive for more compact development, saving land; low cost	May simply be tool for greater development efficiency unless linked with agland protection goals; NIMBY resistance to higher density
2 Transfer of Development Credits	Market driven; no public funds for acquisitions; can accomplish multiple goals (e.g., agland protection, compact development, etc.)	Can be complex to design and administer; sending and receiving areas need to be well defined; NIMBY resistance to higher density
3 Urban Infill Development Policies	More efficient use of urban lands; possible infrastructure cost savings; uses less agland; other urban benefits	Redevelopment of blighted areas may be more costly than development of agland; higher densities may meet resistance from homebuyers, developers, realtors and local politicians.
<b>Land Use Planning Tools - County/Regional Planning Strategies</b>		
4 General Plan Agricultural Element	Signals an entities' commitment to agriculture land uses; can tie together in one place all agland conservation policies; proactive	Temporary, can be changed w/one vote; "down-zoning" difficult to do w/o "taking" claims; element itself is just a vehicle
5 Cluster Development	Flexibility in land use planning; compact development; retain agland	Land-use conflicts; urban infrastructure in ag area; growth inducing
6 Exclusive Agricultural Zoning	Low cost; part of general plan; simple to administer; flexible	Can change with one vote of a board or council; variably applied; may be as restrictive as Williamson Act without tax benefits; not always related to quality of agland
7 Sphere of Influence/City Annexation Policies	One primary role is prime agland conservation; preventative tool	Often competitive self-interests of city members hinders its role in agland conservation; could usurp role of general purpose govt. entity
8 New Towns	If planned for strategically, new towns can relieve growth pressures on farmlands and direct to lower quality agricultural lands	Water and transportation needs may present problems for a new nucleus of growth; may simply be new location for growth in addition to continuing growth in existing cities.
<b>Land Use Planning Tools - Urban Separators</b>		
9 Greenbelts	Creates clear definition of boundaries; improved planning certainty; has multiple benefits if accepted in county	Needs agreement among cities/county; see urban limit lines; is somewhat more stable than zoning, but needs to be enforced

Attachment 46

## AGRICULTURAL LAND CONSERVATION TOOLS (continued)

Pros and Cons		
Categories	Pros	Cons
10 Urban Limit Line/Growth Boundary	Provides certainty to landowners; integrated w/general planning approach; may reduce taxes on land outside line; low public cost	Temporary; establishment of line is hot politically; like zoning, can be changed with a vote; may limit land for housing & increase cost
11 Buffers	Provide separation between conflicting land uses (e.g., ag and urban), reducing nuisance complaints, vandalism and trespass problems.	Can be costly to developer, city or farmer; not necessarily proven to address all conflicts; land waste if buffer is not used for urban amenity or lower intensity agriculture.
<i>Fee Simple/Easement Acquisition</i>		
12 Purchase of Ag Conservation Easements	Voluntary; stays on tax rolls; just compensation; landowner income; less costly than fee simple; permanent protection; flexible	Still costly for most threatened lands; permanent loss of development potential; often misunderstood as a property rights taking; landowner resistance to permanent easement
13 Fee Simple Acquisition	More control; generates lease income; often better for owner	Expensive; may remove land from tax roll; liability of ownership
14 Lease, Lease-Purchase	Lower up-front costs than fee simple or easement acquisitions; greater landowner acceptance; flexible	Uncertainty of lease; temporary; may ultimately be more costly
15 Transfer of Development Credits (see above)	Voluntary; stays on tax rolls; just compensation; landowner income; local admin. cost only; incentive for compact development	Can be complicated to administer; NIMBYs in "receiving areas"; cost internalized in housing prices; needs to be well thought out
16 Williamson Act In Lieu Cancellation Fees for Conservation Easements (see above)	Keeps cancellation fee dollars local; flexibility for county/landowner; loss in conservation with cancellation is offset with new easement	Loss of state general fund dollars; requires some state oversight and rules

Attachment 46

### AGRICULTURAL LAND CONSERVATION TOOLS (continued)

Pros and Cons		
Categories	Pros	Cons
<i>CEQA Tools</i>		
17 Land Evaluation and Site Assessment Model	More objective land use decisions; documents decision-making; quantifies impacts of land use decisions; more defensible decisions	Subjectivity can still creep in when setting weighted values to factors; can be time-consuming; may be limited by lack of data; variable effectiveness based on purpose of application
18 Federal Farmland Protection Policy Act for California	Makes state agencies responsible for assessing impacts of projects on farmland; would spur development of consist. state agland policy	Could increase costs of state projects; CEQA already requires assessment of project impacts on farmland; administrative costs
19 Mitigation Banking for Agland Loss	No public funds involved; directly linked to loss of resource; can be strategically linked to general plan; puts a price on resource loss	Requires loss of farmland to protect farmland; increases housing costs; may put city at competitive disadvantage for development; future ag. viability uncertain
<i>Agricultural Enhancement Tools</i>		
20 Right-To-Farm Ordinance	Educational/awareness raising; may offer conflict resolution forum; may limit agricultural landowner liability	Enforceability questioned; must be more than notice in land title to be effective awareness raising/educational tool
21 Federal and State Tax Incentives: Tax Credits/deductions and Capital Gains	Increase incentives for sustaining agricultural uses; encourage ag investment; facilitate transfer of land to next generation	Reduction in federal tax revenues; consumer resistance to more agricultural subsidies; complex policy implications
22 Federal Estate/Inheritance Tax Reform	Reform would allow farms and ranches to be passed along from one generation to the next, keeping land in production; savings to landowner could allow for reinvestment in the land and stimulate local economies.	Reform would be costly to federal government, resulting in lower income tax revenues; would have to be designed to ensure land remains in farming.
23 Agricultural Enterprise Zones	Addresses profitability and practicality of continued farming; recognition that is more than just saving land; multi-faceted; educational	Usually requires public investment in program, policy and budget; requires shift in attitude about agland as urban reserve land; willingness of public to pay for agricultural land and use as an urban amenity
24 Agricultural Enhancement Boards	Like ag elements of general plans; a board can focus entities' policy on agland conservation; develop programs for ag enterprise zones	Many counties already have ag commissions or advisory boards; must have clear role and public support; requires additional staff

Attachment 46

### AGRICULTURAL LAND CONSERVATION TOOLS (continued)

Pros and Cons		
Categories	Pros	Cons
25 Agricultural Land Redevelopment Act	Would use tax increment funding to enhance urban fringe farmland; could be a tool to consolidate fragmented parcels too small to farm	Undeveloped idea; would tax increment from enhanced farmland be enough? Would there be city or landowner interest or support?
<i>Funding Mechanisms</i>		
26 Installment-Purchase Financing	Uses future dollars to protect land today; multiple landowner tax benefits; flexible for landowner; successfully uses in Maryland	Would require significant upfront, long-term funding; has not been tested extensively
27 Tax Increment - Agland Transfer	Requires no new public funding or taxes; links cost of loss of farmland with protection of farmland elsewhere; can be used with other tools	Local government foregoes normal property tax revenue often anticipated to help pay for urban services
28 Tax Increment - Williamson Act Land	See benefits of "Tax Increment", above; would increase tax benefits and incentives for land remaining in Williamson Act	Local government foregoes normal increase in tax revenue as land exits Williamson Act contracts; increment may not be enough
29 Williamson Act In Lieu Cancellation Fees for Conservation Easements	See item 13, above	See item 13 above
30 Bond Measure	Uses future funds to protect currently threatened agland; voter acceptance of bond measures may be improving with economy	Increases public debt; voter approval in recent years difficult; cost
<i>Funding Mechanisms</i>		
31 Land Transfer Tax or Fee	Direct policy link of fund source (i.e., loss of farmland) with agland conservation; times of greatest threat also times of greatest revenue	Competing uses for land transfer fees; increases cost of development and housing; taxpayer resistance to new tax; sale not necessarily equivalent to land value increase
32 Sales Tax	Taxes and benefits stay local; those enjoy benefits pay directly	Increases costs of living; taxpayer resistance to new tax
33 Donation	No direct cost to the public; tax benefits to the landowner (see item 30)	Disposition of donated land needs to be determined; possible loss to local tax roll; conditions of accepting donation needs to be clear; loss of state and federal tax revenue

Attachment 46

### AGRICULTURAL LAND CONSERVATION TOOLS (continued)

Pros and Cons		
Categories	Pros	Cons
34 Tax Credit (SB 1280)	No upfront public costs; provides incentives for land donations; provides capital for landowner investment in land improvements	Public cost is in foregone income tax revenues; criteria for accepting donations must be clear; disposition of land needs to be clear
35 City-County Development Agreements	City and county cooperation engendered and competition for development reduced; city control over border and sprawl; promote compact urban growth; reduced county rural development service costs	Difficult to overcome jurisdictional competition; may limit development options and increase housing costs; may raise representation issues.
36 City-County Revenue Sharing Agreements	Reduced interjurisdictional competition for development; balances costs and revenues for development	Revenue sharing divisive; only so much revenue to go around; poor substitute for a statewide solution to local revenue shortfall
37 Project Development Agreements	Linked with loss of farmland; flexible; may require no public finances	Questions of legality have been raised in some cases; usually reactive, not proactive

Notes:

- Counties are ranked by design value. See note 12 below.
- Total Population** represents the at-risk populations in counties with PM<sub>2.5</sub> monitors.
- Those **18 & under** and **65 & over** are vulnerable to PM<sub>2.5</sub> and are, therefore, included. They should not be used as population denominators for disease estimates.
- Pediatric asthma** estimates are for those under 18 years of age and represent the estimated number of people who had asthma in 2008 based on national rates (NHIS) applied to county population estimates (U.S. Census).
- Adult asthma** estimates are for those 18 years and older and represent the estimated number of people who had asthma during 2008 based on state rates (BRFSS) applied to county population estimates (U.S. Census).
- Chronic bronchitis** estimates are for adults 18 and over who had been diagnosed in 2008, based on national rates (NHIS) applied to county population estimates (U.S. Census).
- Emphysema** estimates are for adults 18 and over who have been diagnosed within their lifetime, based on national rates (NHIS) applied to county population estimates (U.S. Census).
- Adding across rows does not produce valid estimates, e.g., summing pediatric and adult asthma and/or emphysema and chronic bronchitis.
- CV disease** estimates are based on National Heart Lung and Blood Institute (NHLBI) estimates of cardiovascular disease applied to county population estimates (U.S. Census).
- Diabetes** estimates are for adults 18 and over who have been diagnosed within their lifetime, based on state rates (BRFSS) applied to county population estimates (U.S. Census).
- Poverty estimates come from the U.S. Census Bureau and are for all ages.
- Design Value** is the calculated concentration of a pollutant based on the form of the National Ambient Air Quality Standard, and is used by EPA to determine whether the air quality in a county meets the standard. Design values for the annual PM<sub>2.5</sub> concentrations by county were collected from data previously summarized by the EPA and were downloaded on December 1, 2009 from EPA's website at <http://www.epa.gov/air/trends/values.html>.
- Grades** are based on EPA's determination of meeting or failure to meet the NAAQS for annual PM<sub>2.5</sub> levels during 2006-2008. Counties meeting the NAAQS received grades of Pass; counties not meeting the NAAQS received grades of Fail.

Notes:

- Counties are ranked by weighted average. See note 10 below.
- Total population represents the at-risk populations in counties with ozone monitors.
- Those 18 and under are vulnerable to ozone and are, therefore, included.
- Pediatric asthma estimates are for those under 18 years of age and represent the estimated number of people who had asthma in 2008 based on national rates (U.S. Census).
- Adult asthma estimates are for those 18 years and older and represent the estimated number of people who had asthma during 2008 based on state rates (BRFSS) applied to county population estimates (U.S. Census).
- Chronic bronchitis estimates are for adults 18 and over who have been diagnosed within their lifetime, based on national rates (NHIS) applied to county population estimates (U.S. Census).
- Emphysema estimates are for adults 18 and over who have been diagnosed within their lifetime, based on national rates (NHIS) applied to county population estimates (U.S. Census).
- Adding across rows does not produce valid estimates, e.g., summing pediatric and adult asthma and/or emphysema and chronic bronchitis.
- Poverty estimates come from the U.S. Census Bureau and are for all ages.
- The Weighted Average was derived by counting the number of days in each unhealthy range (orange, red, purple) in each year (2006-2008), multiplying the total in each range by the assigned standard weights (i.e., 1 for orange, 1.5 for red, 2.0 for purple), and calculating the average.
- Grade is assigned by weighted average as follows: A=0.0, B=0.3-0.9, C=1.0-2.0, D=2.1-3.2, F=3.3+.

Notes:

1. Cities are ranked using the highest design value for any county within that Combined or Metropolitan Statistical Area.
2. Total Population represents the at-risk populations for all counties within the respective Combined or Metropolitan Statistical Area.
3. Those 18 & under and 65 & over are vulnerable to PM<sub>2.5</sub> and are, therefore, included. These should not be used as population denominators for disease estimates.
4. Pediatric asthma estimates are for those under 18 years of age and represent the estimated number of people who have been diagnosed within their lifetime. Based on national rates (NHIS) applied to county population estimates (U.S. Census).
5. Adult asthma estimates are for those 18 years and older and represent the estimated number of people who have been diagnosed within their lifetime. Based on national rates (NHIS) applied to county population estimates (U.S. Census).
6. Chronic bronchitis estimates are for adults 18 and over who have been diagnosed within their lifetime. Based on national rates (NHIS) applied to county population estimates (U.S. Census).
7. Emphysema estimates are for adults 18 and over who have been diagnosed within their lifetime. Based on national rates (NHIS) applied to county population estimates (U.S. Census).
8. Adding across rows does not produce valid estimates, e.g., summing pediatric and adult asthma and for combined chronic bronchitis.
9. CV disease estimates are based on National Heart Lung and Blood Institute (NHLBI) estimates of cardiovascular disease applied to county population estimates (U.S. Census).
10. Diabetes estimates are for adults 18 and over who have been diagnosed within their lifetime. Based on state rates (BRFSS) applied to county population estimates (U.S. Census).
11. Poverty estimates come from the U.S. Census Bureau and are for all ages.

## Notes:

1. Cities are ranked using the highest weighted average for any county within that Combined or Metropolitan Statistical Area.
2. Total Population represents the at-risk populations for all counties within the respective Combined or Metropolitan Statistical Area.
3. Those 18 & under and 65 & over are vulnerable to PM<sub>2.5</sub> and are, therefore, included. They should not be used as population denominators for disease estimates.
4. Pediatric asthma estimates are for those under 18 years of age and represent the estimated number of people who had asthma during 2008 based on national rates (NHIS) applied to county population estimates (U.S. Census).
5. Adult asthma estimates are for those 18 years and older and represent the estimated number of people who had asthma during 2008 based on state rates (BRFSS) applied to county population estimates (U.S. Census).
6. Chronic bronchitis estimates are for adults 18 and over who have been diagnosed within their lifetime, based on national rates (NHIS) applied to county population estimates (U.S. Census).
7. Emphysema estimates are for adults 18 and over who have been diagnosed within their lifetime, based on national rates (NHIS) applied to county population estimates (U.S. Census).
8. Adding across rows does not produce valid estimates, e.g., summing pediatric and adult asthma and/or emphysema and chronic bronchitis.
9. Poverty estimates come from the U.S. Census Bureau and are for all ages.

Mr. David Bryant  
Project Planner  
Tulare County Resource Management Agency  
5961 South Mooney Boulevard  
Visalia, CA 93277

Re: Tulare County General Plan Update and  
Recirculated Draft Environmental Impact Report

Dear Mr. Bryant:

Please accept and consider these comments from American Farmland Trust (AFT) on the revised Tulare County General Plan Update (GPU) and Recirculated Draft Environmental Impact Report (RDEIR).

I12-1

Background information on AFT and its interest in the Tulare GPU can be found in our previous comments submitted to the County on February 14, 2007. Rather than repeat those comments, we attach them and incorporate them by reference in this document. We would add the following points for amplification.

The main shortcoming of the updated GPU remains that it would tolerate, if not encourage, widely scattered development at what appears to be very low densities, thus wasting farmland, other resources and tax dollars. This is the antithesis of the kind of smart, efficient planning for growth that communities around California and the United States are embracing as the key to economic opportunity, environmental sustainability and the protection of the resource on which America's food supply depends.

I12-2

The GPU would permit development in 41 separately identified places around the county, as well as in ill-defined transportation corridors and unspecified new towns. As much as a quarter of new development would be welcomed outside existing cities. The rationale for this seems to be a desire to create economic opportunity for every community within the county.

I12-3

While we wholeheartedly support this goal, we question whether widely dispersing development would achieve it. It could actually dilute the economic impact of new growth in the County and reduce the opportunity of any given community to capitalize on it. Further, the higher costs associated with creating widely-spread demand for

public services<sup>1</sup> could render communities less able to afford them and make them less attractive to new business. | I12-3  
cont'd

The GPU would also permit and encourage development at very low densities. Neither document explicitly quantifies the build-out density implied by the GPU. But we calculate that the average build-out density under the GPU would be only 5.3 people per acre, lower than the current development trend in Tulare County of 5.7 people per acre, which in turn is only 70% of the San Joaquin Valley average of 8.1 people per acre.<sup>2</sup> If we assume that roughly three-quarters of the build-out area will be residential,<sup>3</sup> the net housing density would be 6.9 people per acre, which at 3 people per household translates into roughly 2.3 dwellings per acre. In other words, housing lots would average just under a half-acre – over the entire county. | I12-4

This astonishing conclusion raises a question about whether, in fact, Tulare County needs more than 59,000 acres of farmland to accommodate anticipated growth out to the year 2030. If the average residential density were increased to the San Joaquin Valley average of 8.1 people per acre, 6,715 acres or 15% of the farmland that would be lost to urbanization could be conserved. If average residential density were increased to 12 people per acre – the prevailing trend in Stanislaus County, which has the highest development efficiency in the San Joaquin Valley – 19,300 acres or 42% of the farmland that the RDEIR assumes will be lost could be saved.<sup>4</sup> Almost three-quarters of this land would be prime farmland. (GPU, Table 3.10-9) In view of this, consideration should, thus be given to reducing the size of many of the CACUDB, HDB and CACUABs. | I12-5

The GPU proposes a series of new mitigation measures to reduce the impact of planned development on farmland. They include agricultural conservation easements (AG-1.6, AG-1.18, Ag Element Implementation Measure (AEIM) #15), a comprehensive mitigation program (AEIM #1), a review of agricultural land preservation programs (AEIM #2) and, most significantly, a cooperative effort by TCAG and LAFCO to monitor farmland conversion and development efficiency | I12-6

---

<sup>1</sup> See, e.g., *Alternatives for Future Urban Growth in California's Central Valley: The Bottom Line for Agriculture and Taxpayers* (American Farmland Trust, 1995), finding that the higher public service costs associated with low density development (3.5 DU per acre) would result in a collective budget deficit for cities in the region.

<sup>2</sup> The RDEIR assumes that the designated growth areas, totaling 59,435 acres, will be fully built out by the 2030 planning horizon of the GPU. (GPU, Table 3.10-9). The projected population increase that will be accommodated within them is 313,970. (RDEIR, 2-24). Dividing the population by acreage yields an average of 5.3 people per acre. The current trend (2000-2008) is derived from the following figures: The population of Tulare County grew 53,715 from 368,628 to 422,343 (U.S. Census estimate), while the area of urban and built-up land grew by 9,448 acres during the same period (CA Dept of Conservation, Farmland Mapping & Monitoring Program), yielding an average of 5.7 people per acre. Comparable figures for the San Joaquin Valley were derived from the same sources. | I12-4  
cont'd

<sup>3</sup> The preferred growth scenario submitted by TCAG to the San Joaquin Blueprint assumed 76 percent residential.

<sup>4</sup> Another way to look at this is that it would extend the capacity of the existing 59,435 acres within designated growth areas out to the year 2057, without any change in commercial FARs that could achieve further savings. It also bears noting that, even at the Stanislaus density, housing lots would average one quarter acre – hardly a “high rise” growth scenario. | I12-5  
cont'd

(density) and to produce a report that documents the number of people per developed acre in each designated growth area (AEIM #7).<sup>5</sup>

I12-6  
cont'd

These mitigation measures are praiseworthy. AFT not only supports them, but would be glad to work with County officials and other stakeholders to implement them. However, as we document above, none of them would mitigate farmland loss as effectively as simply reducing the average size of residential lots contemplated by the GPU. Thus, we disagree with the conclusion of the GPU that there are “no additional technologically or economically feasible mitigation measures are currently available to reduce this impact [on farmland] to a less than significant level.” (GPU 3.0-16)

Indeed, Alternative 5, the so-called “confined growth” option,<sup>6</sup> “would require greater land use efficiency standards for development on important farmlands and promote increased densities and mixed use areas within developed areas.” (RDEIR, 3.10-15, 16) The RDEIR concludes that this is the “environmentally superior alternative.” As suggested above, we submit that it is also likely to be the economically superior alternative as well as the one that best serves the county’s agriculture industry. AFT supports the adoption of this alternative or, at a minimum, the incorporation of development efficiency standards into whatever GPU option is selected.

I12-7

In conclusion, we would like to point out that Tulare County’s neighbors – Fresno, Kings and Kern Counties – all seem to have embraced the idea of smarter, more efficient growth, judging from their preferred Blueprint scenarios and the land use-related greenhouse gas reduction targets recently submitted under SB 375. They apparently believe that true economic opportunity rests upon conserving, rather than wasting both resources and taxpayer dollars. If Tulare hopes to compete with them for new businesses that will help diversify the local economy, can it alone afford to adopt a GPU that ignores smart growth principles?

I12-8

All of these comments are offered in a spirit of cooperation. We will be glad to discuss any of them and to collaborate with the County in responding to them.

Respectfully,

Edward Thompson, Jr.  
California Director  
[ethompson@farmland.org](mailto:ethompson@farmland.org)

<sup>5</sup> The development efficiency study comes close to the development efficiency benchmark system that AFT recommended in its earlier comments on the GPU. The difference is that a study would simply document the waste of farmland after-the-fact, rather than prevent it by evaluating development proposals against minimum efficiency standards.

I12-6  
cont'd

<sup>6</sup> This terminology is not only misleading, it appears to be deliberately calculated to cast this alternative in a negative light. A more appropriate label might be the “controlled” growth scenario, in contrast to what is arguably the uncontrolled growth scenario contemplated by the proposed project GPU. As a practical matter, there isn’t much difference between them in terms of where growth would occur. The controlled scenario would accommodate 26% of population growth outside Tulare cities, while the proposed project scenario would accommodate 30%.

I12-7  
cont'd

**Comments and Recommendations  
on the Proposed Tulare County General Plan Update  
February 14, 2007**

The proposed Tulare County general plan update (GPU) was released to the public in November 2006 as a draft *Goals and Policies Report* (GPR). The deadline for public comment is February 14, 2007.

American Farmland Trust deeply appreciates the opportunity to submit comments on the proposed general plan update. We have the utmost respect for local land use decision making, and have consulted farmers, officials and others in Tulare County as we prepared these comments. We hope and trust that they will be received in the same spirit of cooperation as they are offered. We would be glad to discuss them with County planners and elected officials at any time.

**Summary**

Tulare County is developing more land per new resident than any other county in the Central Valley. At the current rate, its urban area will almost double in size by 2025. Most of the 40 cities, communities and hamlets in the county – all of which are slated to grow under the proposed general plan update – are located in the midst of productive farmland. Thus, the only effective way for the county and its cities to conserve a meaningful amount of farmland is to improve the efficiency of development. The proposed general plan update includes many policies aimed at minimizing the conversion of farmland, but none directly addresses the critical issue of per capita land consumption. AFT proposes that the County adopt an explicit policy of measuring, tracking, publicizing and reducing per capita land consumption and pledges to work with County officials to implement it.

**American Farmland Trust and Its Interest in the Tulare GPU**

AFT is a national nonprofit organization founded in 1980 to protect the best farmland from conversion to other uses and to help farmers adopt agricultural practices that will improve environmental quality. It is widely acknowledged to be the nation's most authoritative source of information and expertise about farmland protection policies. We have had an office in California since 1983 and have made the Central Valley the focus of our efforts in the state ever since an AFT research report *Farming on the Edge* (1993) concluded that the region was – as it still is – the most productive agricultural area in America under the most severe urban growth pressure. As the second highest grossing agricultural county in the Valley – indeed, in the United States – Tulare is among the jurisdictions that AFT is most interested in helping to conserve the farmland that is the basis of its economy.

In 1995, AFT completed another research project in cooperation with the University of California campuses at Berkeley and Davis, entitled *Alternatives for Future Urban Growth in California's*

*Central Valley: The Bottom Line for Agriculture and Taxpayers.*<sup>1</sup> That study projected two different growth patterns into the future, finding that a continuation of present trends would consume far more farmland and have a greater negative impact on both the agricultural economy and the cost of municipal services than a more compact, efficient model of development that has come to be called "smart growth." In 2006, AFT released another report *The Future Is Now: Central Valley Farmland at the Tipping Point*<sup>2</sup> which found that, despite the adoption of local plans and policies favoring smarter growth, the pattern of development in the Central Valley has not changed much from a decade earlier. Tulare County was the only county that actually regressed by developing less efficiently than in the past.

AFT places a great deal of emphasis on factual analysis as the basis for public policies that will effectively conserve and protect farmland for agricultural use. We, therefore, offer the facts as we know them as the basis for our comments on the proposed Tulare County general plan update. While we have confidence in our sources and analysis, we acknowledge that the County itself may have better information, gathered from local rather than the statewide sources AFT relied on, that may shed even clearer light on the issues raised by the plan. If so, we encourage the County to recalculate the key figures presented below on farmland conversion and planned growth.

## **Factual Background**

Tulare County has long been acclaimed as a national leader in farmland protection. For more than a quarter-century, its Rural Valley Lands Plan has been celebrated as an innovative approach to preventing the unnecessary development of high quality agricultural land. Recent evidence, however, calls into question the efficacy of the county's overall policy framework – and, not to be ignored, the policies of the cities within it – at preventing the kind of unnecessary farmland conversion that can undermine the health of its agricultural economy.

In a region like the Central Valley where the population is exploding, but the amount of farmland remains relatively fixed,<sup>3</sup> the key to minimizing the loss of farmland and, thereby, maintaining agricultural production capacity, is to reduce *per capita* land consumption, i.e., the amount of land developed for each new resident. During the 1990's, development within Tulare County (including its cities) consumed an acre of farmland – 10,070 acres in all – for every 5.7 new residents, ranking it at the very bottom of all Central Valley counties in its performance at avoiding unnecessary farmland loss.<sup>4</sup> Indeed, measured on a *per capita* basis, Tulare is using up farmland 1.4 times as fast as the Valley as a whole, which itself averaged only 8 people per acre.<sup>5</sup>

---

<sup>1</sup>[http://www.farmlandinfo.org/documents/30361/FUTURE\\_URBAN\\_GROWTH\\_IN\\_CALIFORNIAS\\_CENTRAL\\_VALLEY.pdf](http://www.farmlandinfo.org/documents/30361/FUTURE_URBAN_GROWTH_IN_CALIFORNIAS_CENTRAL_VALLEY.pdf)

<sup>2</sup> [www.farmland.org/programs/states/futureisnow/default.asp](http://www.farmland.org/programs/states/futureisnow/default.asp)

<sup>3</sup> There is simply no substitute for high-quality farmland. As the *Report of the Agricultural Task Force for Resource Conservation and Economic Growth in the Central Valley* (1998), whose vice chair was current state Resources Agency Secretary Mike Chrisman, put it: "During California's post World War II sprawl, new agricultural technologies an additional irrigation allowed more intense agricultural production to occur while prime soils were being urbanized. This is no longer a viable option. We cannot expect the same kinds of yields nor to remain competitive in a global market if agriculture is pushed onto lower quality soils that require higher inputs." <http://www.cfbf.com/issues/landuse/report1.cfm>

<sup>4</sup> This and, unless otherwise referenced, all other figures in this comment letter are from AFT's 2006 report, *The Future Is Now: Central Valley Farmland at the Tipping Point*, cited above. Most of the raw data on

The inefficiency of development in Tulare County wouldn't be so problematic if the land being lost were not so highly productive. But 58 percent of all the land developed in Tulare during the 1990's – and 71 percent of that developed between 2000 and 2004 – was prime, unique or statewide important farmland. This is attributable to the fact that almost all of Tulare's cities, communities, hamlets and other developing areas are located in the midst of this high quality farmland. Indeed, 78 percent of all the land within current city spheres of influence in Tulare County is high quality farmland. Thus, as long as the existing cities and unincorporated communities in Tulare County continue to grow, it is unrealistic to suggest (as the GPU does) that a strategy of directing development away from high quality farmland can succeed. The only way to truly minimize the loss of the county's best farmland is to reduce the amount of this land consumed by each new resident.

If the current, inefficient development patterns continue, and the county's population grows by the 189,400 people the County's *General Plan Background Report* (at 2-40) predicts by 2025,<sup>6</sup> Tulare County will lose another 33,200 acres of farmland to urbanization – roughly doubling the current urban area of the county's cities. By contrast, about 50,900 (59%) of the 86,700 acres within the current city spheres of influence in Tulare County remain undeveloped. We have not been able to determine the amount of undeveloped land within community and hamlet urban development boundaries. But the developed area outside city spheres of influence (16,400 acres) represents about 31 percent of the developed area within them.<sup>7</sup> If we assume that these outlying areas are permitted to grow at roughly the same proportion as areas within spheres, it would suggest that an additional 15,800 acres could be available for development.<sup>8</sup> Thus, the total land now planned for urban growth appears to be as much as 66,700 acres – more than twice as much as would be needed to accommodate all development through 2025, even if its efficiency is not increased at all. On the other hand, if the efficiency of development were increased to the Valley-wide average of 8 people per acre, only 23,675 acres would be needed to accommodate growth through 2025; and if it were increased to 15 people per acre, roughly comparable to the prevailing average in the Bay Area and urban Southern California, only 12,625 acres would be needed – less than 20 percent of the land currently planned for development.

In summary, Tulare County and its cities are consuming more farmland per new resident than any other county in the Central Valley. They have earmarked far more land for development than is needed for growth through 2025, even if development does not become more efficient. And most of the land being developed, as well as that planned for development around existing cities and other communities, is of the highest quality for agriculture, making a strategy of avoiding high

---

which that report relies is from the Farmland Mapping and Monitoring Program of the state Department of Conservation.

<sup>5</sup> For comparison, new development in the urban areas of the Bay Area and Southern California averaged 14 and 15 people per acre respectively in the 1990's.

<sup>6</sup> The report projects a population of 630,529 by 2025. A 2007 population estimate of 441,100 was obtained by interpolating the 2005 and 2010 data in Table 2-25, yielding a net increase of about 189,400.

<sup>7</sup> This does not include another 21,000 acres of existing "ranchette" development (rural residences on lots from 1 ½ to 20 acres, which are, needless to say, the most inefficient development of all.

<sup>8</sup> Estimated by multiplying the 31 percent of development outside spheres by the amount of available land within spheres (0.31 x 50,900 = 15,800).

quality farmland unrealistic. It is against this background that we evaluated the proposed general plan update.

## Our Core Recommendation

- Our principal recommendation for improving the draft general plan is to incorporate policies and implementing mechanisms that will commit the county (and the cities within it) to making a concerted, systematic and good faith effort to increase the efficiency of development and thereby reduce overall per capita land consumption to the extent necessary to save a specific amount of high-quality farmland that would otherwise be developed by the year 2025. In this way – and perhaps only in this way – can the County actually implement its proposed policy of “minimiz[ing] the conversion of existing agricultural land ... associated with new development” (LU-1.8, Land Use Element, New Policy, GPR, 5-12) while enabling its cities and other communities to continue to grow.

Increasing development efficiency will also help achieve other smart growth goals that the County says it embraces, among them, reducing public service costs, traffic congestion and air pollution (including greenhouse gas emissions), and creating more economic opportunity for all communities. True economic opportunity for communities in Tulare County can be realized, we submit, without the unnecessary sacrifice of farmland. Indeed, wasting land on sprawling development is widely recognized to be a deterrent to true economic opportunity because of the excessive financial burdens it puts on growing communities.<sup>9</sup>

## Critique of the Proposed General Plan Update

The proposed general plan update contains many lofty and laudable goals with respect to protecting farmland through smarter growth, among them:

- “The County will protect its agricultural economy while diversifying employment opportunities.” Value Statement #1, *Goals and Policy Report* (GPR), A-1
- “Protect the county’s agricultural uses ... from urban encroachment.” Principle 3, Planning Framework, GPR, A-2
- “Preservation of productive agricultural lands shall be the highest priority when considering modifications (to urban development boundaries).” PF-2.2, Planning Framework, GPR, 2-6
- “The County shall maintain agriculture as the primary land use in the valley region of the county.” AG-1.1, Agriculture Element, GPR, 4-3

---

<sup>9</sup> For example, AFT’s report *Alternative Futures for California’s Central Valley*, cited above, found that a continuation of current development patterns would result in 24% higher public service costs for municipalities than would the same amount of development that is roughly twice as efficient, making it less likely that adequate services could be provided. (Summary Report, at 12).

- "The County shall promote the preservation of its agricultural economic base and open space resources through ... identification of urban growth parameters for all urban areas located in the county." AG-1.7, Agriculture Element, GPR, 4-4
- "The County shall promote the principles of smart growth within UDBs and HDBs, including ... discouraging sprawl, urban infill and preserving open space." LU-1.1, Land Use Element, GPR, 5-12; and last but perhaps most importantly ...
- "The County shall encourage and provide incentives for infill development ... to maximize the use of land within existing urban areas, [and] minimize the conversion of existing agricultural land ... associated with new development. LU-1.8, Land Use Element, New Policy, GPR, 5-12.

We applaud these good intentions. But the ability of the County to achieve these goals will be made very difficult by several other key policy decisions reflected in the proposed GPU:

- New development is permitted in a large number of widely-scattered cities (8), unincorporated communities (19), hamlets (13), and an unspecified number of possible new towns (PF-2, GPR, 2-5; PF-3, GPR, 2-8; PF-5, GPR, 2-10);
- An exceedingly liberal policy of considering urban boundary expansions upon a simple request for subdivision approval, among other methods. (PF-2.2, GPR, 2-6; PF-3.2, GPR, 2-8). This is exacerbated by an illusory policy of allowing urban boundary expansions "only when ... non-agricultural lands are not reasonably available to the community," a condition that will almost always be met because nearly every community and hamlet in the county is surrounded by productive farmland.<sup>10</sup> (PF-4.6, GPR, 2-10)
- The designation of far more land within city spheres of influence and the urban development boundaries of unincorporated communities and hamlets than will be needed to accommodate the population in 2025 (see Factual Background, above).

All of these are open invitations to inefficient urban sprawl that is likely to consume far more agricultural land than is necessary to achieve the county's economic opportunity goals, sacrificing agricultural production, revenue, jobs and open space that could be saved if these policies were tightened. We suggest changes in each of these three policy decisions.

Permitting urban expansion merely through a subdivision proposal, really ought to be reconsidered. There appears to be no good reason for such a piecemeal approach to expansion, one that will be subject to political favoritism and likely to ignore cumulative impacts on farmland. The GPU offers several other, more comprehensive avenues for considering expansion that probably are not as subject to these pitfalls.

---

<sup>10</sup> Similarly, the proposed new policy of "direct[ing] development away from valuable agricultural lands to cities, unincorporated communities and hamlets (LU-2.1, GPR, 5-15) appears to be completely ineffectual, given that practically all the undeveloped land in these settlements is productive agricultural land.

Permitting development in every existing community, large and small, and allowing adequate room for it to occur (as the first and third of the above policies do), appear to be unavoidable as long as the county is committed to promoting economic opportunity for all. But new towns should be carefully evaluated lest they divert economic opportunity away from existing communities and pose additional risks to agriculture as new magnets for development, land price inflation and potential land use conflicts. And the county should take stronger measures to assure that economic opportunity is not squandered by allowing development to consume more farmland and tax dollars than necessary.

One measure that is essential to preventing unnecessary, counterproductive farmland conversion in Tulare County, given the foregoing circumstances and policies, is the adoption of an explicit policy of minimizing conversion of the highest quality farmland and a mechanism by which to implement it in the only way that is likely to be effective: measure, track and reduce the total amount of farmland consumed by the 189,400 new residents the county will add by 2025.

The closest that the GPU appears to come to such a policy is in its conditions for supporting the expansion of city urban development boundaries:

"The County shall encourage orderly outward expansion of urban development by supporting those city UDB expansion proposals where the city has demonstrated a need for additional territory after documenting a good faith effort to implement an infill development program and *minimize conversion of productive agricultural lands.*"  
(Emphasis added, PF-4.6, GPR, 2-10)

Again, the intention is praiseworthy, if limited in scope. But unless there is some way to measure how much land development is consuming, not just in the aggregate and after the fact, but in advance and in terms of the amount used on average for each new resident; and unless there are affirmative steps taken to try to decrease *per capita* land consumption; it is difficult to understand how any city could demonstrate the kind of good faith effort this policy seems to call for. Further, limiting the policy to the expansion of cities, in which the county has only an advisory role, inexplicably excludes the opportunity to minimize farmland conversion in cases where the county has direct approval authority over the expansion of unincorporated communities and hamlets and over the location and configuration of new towns.

Therefore, we propose that the County adopt the following policy (or a refinement thereof) as part of the general plan update. It is intended to supplement the other well-intentioned farmland protection policies in the GPU by providing a test that can be applied to future decisions about development to provide better information on which to base such decisions.

## **LU-1.x Efficient Development to Minimize Agricultural Land Conversion**

The County shall promote efficient development that minimizes the conversion of agricultural land and other resources by adopting and applying Development Efficiency Targets in making future land use decisions affecting agricultural land. The County shall establish Targets for average residential density and commercial floor-to-area ratios (to be applied to public projects as well as private development), based on the amount of land to be dedicated to these uses, the projected population and the goal of limiting future

urbanization of agricultural and other open land within the County (including those portions within cities) to not more than 16,000 acres through the year 2025.<sup>11</sup>

The County shall use these Targets (and encourage cities to use them) to evaluate existing spheres of influence and urban development boundaries, existing zoning districts, rezoning petitions, community and specific plans, new town proposals, agreements with cities that would expand their spheres of influence or urban development boundaries, and all new development projects within the unincorporated area of the County that are not already part of a community or specific plan. Such evaluations shall include specific findings, to be made available to the general public, that quantify any deviation of the efficiency of the development that is or would be authorized from the applicable Development Efficiency Targets.

The County shall also identify obstacles to increasing the efficiency of urban development and shall adopt (and encourage cities to adopt) changes in policies, zoning, rules and incentives to enable and encourage all communities to meet Development Efficiency Targets.

This proposed policy would be relatively simple to implement<sup>12</sup> and would provide vital information for future land use decision making. It would not require any specific changes in local zoning or subdivision rules, though it could lay the foundation for graduated mitigation fees and other incentives to encourage more efficient development of farmland. What it ultimately would do is focus the attention of decision makers on the critical issue of development efficiency and, by making empirical information available to them and the public, encourage greater accountability for implementing the County policy of minimizing agricultural land conversion. If it is sincere about wanting to conserve farmland and protect agriculture, frankly, we see no good reason why the County would not want to adopt such a policy and implementing mechanisms.

We would welcome the opportunity to discuss our comments and recommendations with County planners, elected officials and others with an interest in conserving farmland and safeguarding the agricultural economy of Tulare County, while providing greater economic opportunity for all.

Respectfully,

Edward Thompson, Jr.  
California Director  
530-753-1073  
[ethompson@farmland.org](mailto:ethompson@farmland.org)

---

<sup>11</sup> This implies an average development efficiency of about 12 people per acre over the period, double the current trend in Tulare County. It would save 25 square miles of farmland. Obviously, a less ambitious goal could be established, but we believe that what we propose is both realistic and worthwhile.

<sup>12</sup> We are incorporating as part of our comments a spreadsheet that begins to suggest a general approach to establishing Development Efficiency Targets and allows the County to substitute its own data for the sample data it contains. A printout of the sample data is on the next page.

<b>Establishing Development Efficiency Targets:</b>	
<b>Comparison of Current Trend with Potential Gains in Efficiency</b>	
<i>Enter data into green cells only.</i>	
<b>Inputs</b>	
Urban Population - Current	300,000
Total Area of Urban Footprint (Ac) - Current	50,000

**Re: Comments on Revised Draft Environmental Impact Report for Tulare  
County General Plan Update (SCN#2006041162)**

Dear Mr. Bryant:

Please find attached, the community comment letter which the Center for Biological Diversity, the Center on Race, Poverty & the Environment, and the Community Water Center incorporated by reference into their joint comments on the Revised Draft Environmental Impact Report. Three hundred, ninety-one community residents from six unincorporated communities signed onto the letter.

Thank you for considering the communities' concerns.

I13-1

Sincerely,

Caroline Farrell  
Acting Executive Director

Resource Management Agency  
Tulare County  
Mooney Blvd.  
Visalia, CA

Estimada Agencia de administración de Recursos:

Nosotros, los que abajo firmamos residentes de comunidades no incorporadas del Condado de Tulare, estamos preocupados que el Condado continua en dejar nuestras comunidades afuera en su actualización del plan general. El Condado continua priorizando nuevos desarrollos e ignorando a residentes existentes que viven en comunidades no incorporadas.

I13-2

Desde que la revisión del Plan General comenzó hace algunos años, hemos trabajado activamente con otros residentes para mejorar nuestras comunidades. Al mismo tiempo que estamos motivados, necesitamos que el Condado use su influencia, recursos y experiencia para que aproveche todas las oportunidades para hacer las mejoras necesarias. El Condado debe crear políticas que den prioridad a nuestras comunidades en vez de enfocar en influenciar para obtener recursos para mejorar áreas incorporadas que ya tienen recursos. Nosotros urgimos al Condado que adopte políticas y medidas de implementación para tratar nuestras necesidades a largo plazo y también en corto plazo.

I13-3

Primero, el Condado debe desarrollar un sistema de transportacion que cobra las diferecias entre comunidades, poblados y lugares. Comunidades como Plainview, West Goshen, Tooleville y Allensworth estan dentro del area de influencia o incluyendo son parte de otras comunidades—Strathmore, Goshen, Exeter, y Earlimart, respectivamente. El Condado debe que todas las areas del Condado tienen recursos disponibles para hacer las mejoras identificadas por los residentes afectados, incluyendo fondos y oportunidades para participación publica.

I13-4

Segundo, El Condado debe crear un sistema de circulacion que permita a los residents de las comunidades viajar seguros, minimizar los danos a carros y caminos causados por camiones grandes, e incrementar opciones de transporte publico para comunidades rurales a hacia los servicios que necesitan en el Condado. Estas politicas deben tomar en cuenta peatones al igual que vehículos y proveer oportunidades para que todos compartan los caminos de manera segura. Una manera especifica de aumentar la seguridad para los ninos de escuela es designar lugares cubiertos para paradas de autobuses escolares en comunidades rurales.

I13-5

Tercero, El Condado deveria integrar su Plan General actualizado con su Elemento de Vivienda actualizado para aseguara que hay un plan comprensivo cubriendo todas las necesidades de las comunidades. Por ejemplo, el Condado puede convertir lotes vacios en parques o centros comunitarios y promover jardines comunitarios. Ademas, el Condado deveria incentivar proyectos de vivienda para campesinos que no diferencie entre trabajadores documentados y no documentados para que se asegure que las viviendas son usadas para los propositos intentado.

May 8, 2010

Resource Management Agency  
Tulare County  
Mooney Blvd.  
Visalia, CA

Dear Resource Management Agency:

We, the undersigned residents of unincorporated Tulare County, are concerned that the County is continuing to leave our communities behind in its General Plan Update. The County continues to prioritize new development and ignore existing residents living in unincorporated communities.

I13-8

Since the General Plan Update began several years ago, we have been actively working with other residents to improve our communities. While we are very motivated, we need the County to use its influence, resources and expertise to take advantage of every opportunity to make necessary improvements. The County must create policies that prioritize our communities rather than focus on leveraging resources to improve already resourced incorporated areas. We urge the County to adopt policies and implementation measures to address our needs over the long-term and over the short-term.

I13-9

First, the County must develop a transparent system of differentiating between communities, hamlets and places. Communities such as Plainview, West Goshen, Tooleville and Allensworth are within the sphere of influence or even part of other communities—Strathmore, Goshen, Exeter, and Earlimart, respectively. The County should ensure that all areas of the County have resources available to make the improvements identified by affected residents, including funding and public participation opportunities.

I13-10

Second, the County must create a circulation system that allows community residents to travel safely, minimize road and car damage from large trucks, and increase public transit options from rural communities to the services they need throughout the County. These policies must take into account pedestrians as well as vehicles and provide opportunities for all to share the roads safely. One specific way to increase safety for school children is to designate a sheltered school bus stop in rural communities.

I13-11

Third, the County should integrate their General Plan Update and their Housing Element Update to ensure there is a comprehensive plan addressing all the community's needs. For example, the County can convert vacant lots into parks or community centers and promote community gardens. Further, the County should incentivize farmworker housing projects that do not differentiate between documented and undocumented workers in order to ensure that the housing is used for its intended purposes.

I13-12

Resource Management Agency  
Tulare County  
Mooney Blvd.  
Visalia, CA

Estimada Agencia de administración de Recursos:

Nosotros, los que abajo firmamos residentes de comunidades no incorporadas del Condado de Tulare, estamos preocupados que el Condado continua en dejar nuestras comunidades afuera en su actualización del plan general. El Condado continua priorizando nuevos desarrollos e ignorando a residentes existentes que viven en comunidades no incorporadas.

I13-34

Desde que la revisión del Plan General comenzó hace algunos años, hemos trabajado activamente con otros residentes para mejorar nuestras comunidades. Al mismo tiempo que estamos motivados, necesitamos que el Condado use su influencia, recursos y experiencia para que aproveche todas las oportunidades para hacer las mejoras necesarias. El Condado debe crear políticas que den prioridad a nuestras comunidades en vez de enfocar en influenciar para obtener recursos para mejorar áreas incorporadas que ya tienen recursos. Nosotros urgimos al Condado que adopte políticas y medidas de implementación para tratar nuestras necesidades a largo plazo y también en corto plazo.

I13-35

Primero, el Condado debe desarrollar un sistema de transportacion que cobra las diferencias entre comunidades, poblados y lugares. Comunidades como Plainview, West Goshen, Tooleville y Allensworth estan dentro del area de influencia o incluyendo son parte de otras comunidades—Strathmore, Goshen, Exeter, y Earlimart, respectivamente. El Condado debe que todas las areas del Condado tienen recursos disponibles para hacer las mejoras identificadas por los residentes afectados, incluyendo fondos y oportunidades para participación publica.

I13-36

Segundo, El Condado debe crear un sistema de circulación que permita a los residentes de las comunidades viajar seguros, minimizar los danos a carros y caminos causados por camiones grandes, e incrementar opciones de transporte publico para comunidades rurales a hacia los servicios que necesitan en el Condado. Estas políticas deben tomar en cuenta peatones al igual que vehículos y proveer oportunidades para que todos compartan los caminos de manera segura. Una manera especifica de aumentar la seguridad para los niños de escuela es designar lugares cubiertos para paradas de autobuses escolares en comunidades rurales.

I13-37

Tercero, El Condado debería integrar su Plan General actualizado con su Elemento de Vivienda actualizado para asegurar que hay un plan comprensivo cubriendo todas las necesidades de las comunidades. Por ejemplo, el Condado puede convertir lotes vacios en parques o centros comunitarios y promover jardines comunitarios. Además, el Condado debería incentivar proyectos de vivienda para campesinos que no diferencie entre trabajadores documentados y no documentados para que se asegure que las viviendas son usadas para los propósitos intentado.

**Re: Comments on Revised Draft Environmental Impact Report for Tulare County General Plan Update (SCN#2006041162)**

Dear Mr. Bryant:

These comments are submitted on behalf of the Center for Biological Diversity (“CBD”), the Center on Race, Poverty & the Environment (“CRPE”), Community Water Center (“CWC”) and the California Rural Legal Assistance Foundation (“CRLAF”) on the Revised Draft Environmental Impact Report (“RDEIR”) for the Tulare County General Plan Update. CBD is a non-profit environmental organization dedicated to the protection of native species and their habitats through science, policy, and environmental law. CBD’s Climate Law Institute works to reduce greenhouse gas emissions to protect biological diversity, our environment, and public health. CBD has over 225,000 members and e-activists including those located in the County of Tulare. CRPE is a

I14-1

national non-profit environmental justice organization that provides legal and technical assistance to grassroots groups in low-income communities and communities of color fighting environmental hazards. CRPE works with many communities, hamlets, and residents in Tulare County. CWC is a nonprofit organization based in Tulare County that seeks to create community-driven water solutions through organizing, education and advocacy in California's San Joaquin Valley. CWC works directly with a number of low-income, primarily Latino communities in Tulare County and elsewhere in the Valley to address problems that range from chronic drinking water contamination to barriers to participation in local water governance. CRLAF's mission is to improve the quality of life for California farm-workers, their families, and their communities. CRLAF utilizes various strategies to accomplish our mission, including litigation, research, policy and legislative advocacy, and community capacity-building.

I14-1  
cont'd

As the "constitution for all future developments," general plans are required to be "comprehensive and long term."<sup>1</sup> Given the importance of general plans in the planning process, state planning law "compels cities and counties to undergo the discipline of drafting a master plan to guide future local land use decisions."<sup>2</sup> Unfortunately, this requisite discipline appears to be entirely lacking in the County's Update to the General Plan. The County has provided little in the way of additional clarity and consistency since the first Draft Update to the General Plan was originally circulated over two years ago. Indeed, the latest Draft Update fails to fulfill its most basic purpose of guiding future development because the Land Use Element does not meaningfully describe or illustrate the location and intensity of land uses. Absent this information, it is impossible to intelligently assess Project impacts or have any degree of certainty as to what type of growth would occur under the General Plan. Accordingly, the draft Update to the General Plan does not meet the requirements of the Planning and Zoning Code and the RDEIR fails as an informational document.

I14-2

The undersigned organizations urge the County to go back to the drawing board and prepare a legally sufficient Update to the General Plan that sets forth a sustainable future for the County by directing more growth to existing cities and ensuring that growth that does occur in unincorporated areas is guided toward infill opportunities in existing communities and hamlets. The County can thereby preserve its agricultural heritage and avoid the many environmental impacts and fiscal costs that result from sprawl development. Rather than allow sprawl development, the County can better meet its obligations to underserved communities in unincorporated areas and hamlets by entering into revenue sharing arrangements with Tulare cities. In exchange for directing new growth within City boundaries, Cities must be required to address infrastructural disparities with bordering, fringe, and island unincorporated communities and hamlets. In addition, revenue generated by the County from those revenue-sharing agreements must be set aside for ensuring adequate infrastructure and services for existing unincorporated communities and hamlets. In this manner, targeted investments by the County can help improve the quality of life for existing County residents, while future growth occurs in a sensible and sustainable manner.

I14-3

<sup>1</sup> *DeVita v. County of Napa*, 9 Cal.4th 763, 773 (1995).

<sup>2</sup> *Id.*

**I. THE LAND USE ELEMENT DOES NOT MEET THE REQUIREMENTS OF GOVERNMENT CODE SECTION 65302.**

I14-4

Government Code § 65302(a) requires that a land use element designate “the proposed general distribution and general location and extent of the uses of land” for specified purposes and “include a statement of the standards of population density and building intensity recommended for the various districts and other territory covered by the plan.” This requirement is very much the heart of the General Plan. Absent a clear understanding of the proposed location and intensity of land uses, in conjunction with population density standards for the various regions, the impacts of the General Plan Update cannot be properly ascertained.

As presented in the proposed General Plan Update, the land use element only appears to describe land use designations and indicate whether the given designation is allowed in a city, community, hamlet or other unincorporated area. Beyond this very general description, the Land Use Element does not appear to indicate with any specificity the location and extent of each of these uses. For example, the General Plan does not identify the total acreage of proposed land uses and the extent to which changes in land use represent a difference from current conditions. Indeed, the General Plan does not even contain a map that clearly illustrates where and which land uses will occur under the proposed Update. Absent such information, it is impossible to assess Project impacts or understand exactly what is being contemplated by the Plan.

To the extent information on proposed land use designations is available elsewhere, this is insufficient to render the General Plan consistent with state planning law. In providing sufficient information on future land use designations, courts have held that while a map or maps that actually delineate proposed land uses and population standards might exist or be cobbled together from existing data, “uncoordinated documents .... make resort to [the General Plan] for planning information an awkward exercise and would also seem to generate doubt concerning the integrity of the plan.” *Camp v. Board of Supervisors of Mendocino County*, 123 Cal. App. 3d 334, 349 (1981) (land use element that did not correlate density and land use classifications with locations within county failed to comply with section 65302).

Because the land use element is so woefully uninformative, it must be significantly revised to provide an understanding of the potential growth possible under the General Plan and evaluate impacts based on this worst-case scenario. In revising the General Plan, the County could look to the Land Use Element recently completed by Yolo County.<sup>3</sup> Unlike the Project, the Yolo County General Plan land use element provides maps illustrating the land uses contemplated by the General Plan, and the total acreage occupied by these uses. This information can be compared against current uses so decisionmakers and the public are able to surmise how the General Plan would

<sup>3</sup> Yolo County, 2030 General Plan Update, Land Use Element.

represent a change from both existing baseline conditions and allowable growth under the existing General Plan.

I14-4  
cont'd

The deficiencies of the land use element cannot be understated. Without data on where growth will occur, other required general plan elements, such as the circulation and open space elements, are meaningless and potentially inconsistent. As presented, it is entirely unclear whether the objectives and policies set forth in these elements are consistent with the vague and ill-defined land use element.

The land use element's failure to provide enforceable and stable policies to direct growth further precludes a meaningful understanding of where growth could occur. For example, the General Plan would allow for the development of entire new towns. (Goal PF-5.) Because the location, density, and population of these potential new towns is not identified, the extent and type of growth contemplated under the General Plan cannot be accurately ascertained. Similarly, urban development is only "encouraged" in existing UDBs and HDBs but could occur in a number of other locations with ill defined criteria. (PF-1.4.; PF 1.2 (allowing urban growth within foothill development corridors "as determine by procedures set forth in Foothill Growth Management Plan."))

## **II. THE RDEIR VIOLATES CEQA**

I14-5

### **A. The Project Description Lacks Sufficient Detail to be Meaningful**

An EIR cannot accurately assess project impacts if the project itself is not sufficiently described. Accordingly, "[a]n accurate, stable and finite project description is the *sine qua non* of an informative and legally sufficient EIR." *San Joaquin Raptor v. County of Stanislaus*, 27 Cal.App.4th 713, 730 (1994). Because the RDEIR does not provide a meaningful and stable description of the land uses contemplated by the General Plan, it is unclear what exactly is the "project" under review.

While the RDEIR refers to Figure 4.1 in the General Plan Update in an attempt to describe the Project, Figure 4.1 does not identify land uses designated under the General Plan, it simply references other planning documents. Reference to a patchwork of other plans, which themselves contain conflicting and incomplete information, is an insufficient project description. To accurately and sufficiently describe the Project, the RDEIR must be revised to provide maps of the location and intensity of allowable future development.

The RDEIR describes the Project as directing 75% of new population growth to occur within CACUDBs and Spheres of Influence of incorporated cities and 25% to occur mainly within unincorporated communities and hamlets, foothill development corridors, urban and regional growth corridors and mountain service centers. (RDEIR at 2-24). Yet given the utter lack of clarity of where growth could occur, and the significant loophole allowing the creation of new planned communities of potentially tens of thousands of residents in unincorporated areas, there does not appear to be any evidentiary basis to support this assertion. Indeed, the General Plan does not appear to

I14-6

modify land uses to meet and guide projected population growth, but rather to keep future development options as open-ended as possible. While growth may occur as described, it also may not. The RDEIR must provide a worst-case scenario of how growth might be distributed based on allowable development land use designations and intensities set under the General Plan (to the extent clear designations even exist). To the extent the Project could create capacity for most or all projected population growth to occur in unincorporated areas, through new planned communities and/or by providing a wide range of potential development intensity in rural areas, it is inaccurate and misleading to characterize the Project as directing 75% of new population growth to CACUDBs and Spheres of Influence.

I14-6  
cont'd

**B. The Description of Existing Environmental Conditions Lacks Sufficient Detail**

I14-7

CEQA requires that an EIR “include a description of the physical environmental conditions in the vicinity of the project.” Guidelines § 15125. While the RDEIR contains some generalized data on land use designations in a handful of planning areas, it fails to provide maps or otherwise identify where these designations occur and how they may be distributed. Additionally, physical environmental conditions under CEQA refer to on-the-ground environmental conditions, not permitted conditions. Therefore, the RDEIR must be revised to describe development that currently exists in the County, not what may be permissible under existing land use designations. Only in this manner may impacts from the Project be accurately compared and assessed.

**C. The RDEIR Fails to Analyze and Mitigate Project Land Use Impacts Adequately**

I14-8

The mitigating policies and implementation measures listed by the County under this element are insufficient to address the potential adverse impacts created by the project. We suggest the following additional considerations to the policies and implementation measures.

**LU-1.1: Smart Growth and Healthy Communities** - This measure focuses on connectivity between new and existing development. There are many existing, underserved existing communities whose health would benefit greatly from a policy encouraging connectivity between communities and between communities and larger municipal service providers. This policy does not address the benefits of encouraging connectivity among existing communities.

I14-9

**LU-1.8: Encourage Infill Development** – This is a beneficial policy but the Zoning Ordinance discussed in Implementation Measure 3 should promote smart growth principles and reduce cumulative impacts.

I14-10

**LU-1.9: Specific Plans** - It could be desirable to have the planning frameworks found in Table 4.3 consider, for example, how much water a municipal provider is likely to need to provide for possible future connections by nearby existing unincorporated communities. This might be one way of ensuring that new developments don't impede future service connections by existing unincorporated communities.

I14-11

<p><b>LU-4.1: Neighborhood Commercial Uses</b> - The County should also encourage development of neighborhood commercial uses in existing unincorporated communities where such uses will not disproportionately burden such communities. For example, corner stores might be desirable in these areas whereas water-intensive uses would probably not be desirable.</p>	I14-12
<p><b>LU-4.2: Big Box Development</b> – Considering big box developments on a case by case basis, as currently planned, subverts many of the policies laid out in the General Plan, such as the smart growth principles and the community center policies (Economic Development Policy 6.1). A California State Bakersfield study linked the big box development, specifically a proposed Wal-mart, with the potential for increasing urban decay in the surrounding area.</p>	I14-13
<p><b>LU-5.1: Industrial Developments</b> – The County policy to encourage industrial development activities in “appropriate locations” should include criteria or guidance to ensure that “appropriate” is applied fairly and protects existing unincorporated communities. Such guidance might include a requirement for buffers where industrial uses will be sited near existing unincorporated communities and, where appropriate, hiring preferences for people in adjacent areas should be pursued.</p>	I14-14
<p><b>LU-5.2: Industrial Park Developments &amp; ED-3.2: Industry Clusters</b> – The County should adopt restrictions to prevent cumulative impacts to local residents.<sup>4</sup></p>	I14-15
<p><b>ED-2.2: Land Requirements</b> - Clustering industries in industrial parks or industrial areas can be beneficial in terms of reducing impacts on neighbors. However, in terms of some industries, clustering can create local cumulative impacts or hot spots increasing pollution for local residents. The County should adopt an implementation measure that prevents an increase in cumulative impacts.</p>	I14-16
<p><b>LU-5.6: Industrial Use Buffer &amp; ED-2.11: Industrial Parks</b> - The County sets forth a 500 foot buffer as one of the policies, however, the South Coast Air Quality Management District requires a larger buffer for some industries such as warehouses. The California Air Resource Board also has guidance regarding land use planning that discusses the need for set backs. The County should adopt restrictions to prevent cumulative impacts to local residents.<sup>5</sup> In addition, there should be a requirement, or at least a preference, for recreational or green buffers and a requirement for adequate landscaping and screening (not just a high wall) between the uses to minimize visual impacts and enhance the quality of the environment.</p>	I14-17
<p><b>LU-7.6: Screening</b> – There is no criteria to determine what constitutes “landscaping to adequately screen.”</p>	I14-18
<p><b>Land Use Implementation Measure 18</b> - The measure has no standards for what constitutes a “significant buffer,” nor does it lay out what alternative measures would be adequate to create this buffer.</p>	I14-19
<p>Additionally, the County should recognize community and hamlet councils and resident groups during reviews of permits and proposals within their UBD or HBD (Planning Framework Implementation Measure 3) to ensure projects proposed in these areas have the least adverse impact and most benefit for the local residents. In the same vein, partnering with project applicants to prepare community plans has the potential to</p>	I14-20

<sup>4</sup> See: <http://www.arb.ca.gov/ch/handbook.pdf>.

<sup>5</sup> See <http://www.arb.ca.gov/ch/handbook.pdf>

create a conflict of interest and promote inefficient and incongruent planning between communities and hamlets. This policy (PF-2.5) should be removed from the General Plan.	I14-20 cont'd
<b>D. The RDEIR Fails to Analyze and Mitigate Project Traffic and Circulation Impacts Adequately</b>	I14-21
The mitigating policies and implementation measures listed by the County under this element are insufficient to address the potential adverse impacts created by the Project. We suggest the following additional considerations to the policies and implementation measures.	
<b>TC-1.1: Provision of an Adequate Public Road Network</b> - This policy commits the County to establishing and maintaining roads. The implementation measures center around impact fees, Measure R funding, and other state or federal funding sources. The bulk of Measure R funding centers around Visalia leaving 23 unincorporated communities and hamlets to divide up a very small pot. The County should prioritize Measure R money to redress communities and hamlets neglect. They are often least able to leverage their resources to acquire the funds necessary to repair the roads.	I14-22
<b>TC-1.7: Intermodel Freight Villages</b> - The County shall consider the appropriate placement of intermodel freight villages in the County. These villages could have significant air quality impacts for the region and must be tied to implementation measures or sighting criteria that reduce those impacts. As part of Implementation Measure 11, the County should also explore opportunities to build the infrastructure for alternative fuel vehicles. If the infrastructure is in place, the County could then require the use for good movement vehicles operating in the County.	I14-23
<b>TC-1.8: Promoting Operational Efficiency</b> - The County is going to give consideration to those programs that improve the efficiency of the goods movement and enhance farm to market connectivity. This should be tied to reductions in air pollution and should not be at the expense of historically neglected communities and hamlets- the residents of which are farm laborers whose work helps drive the economy of the County. Specifically, the County should promote safer, affordable labor transportation for farm workers in the region through incentives. The County should support programs such as the Kings County Agricultural Industries Transportation Services Farm Worker Vanpool program.	I14-24
<b>TC-1.15: Traffic Impact Study</b> - The County's threshold of significance of 100 peak hour trips per day seems high. For some areas of the County a number under 100 peak hour trips per day might be significant under CEQA. The County should consider that a lower number of peak hour trips might trigger a traffic study depending on the environmental setting.	I14-25
<b>TC-4.4: Nodal Land Use Patterns that Support Public Transit</b> - While we realize that nodal land use patterns are critical to ensuring public transit systems that are more effective, many of these "service area hubs" are also being accessed by residents of the unincorporated communities. The County should have an implementation plan to provide an easy, affordable and effective way for unincorporated community residents to access these hubs with public transit.	I14-26

**TC-4.5: Transit Coordination** - Regional coordination is critical for residents of the rural unincorporated communities. Many of the challenges they face is lack of frequency of service from their unincorporated communities into major city areas such as Visalia or Dinuba, however, these challenges are increased when there is a large lag time, or significant walking distance to access local city transit services. Better coordination between city and transit systems is critical to serving the needs of transit dependent residents of the county.

I14-27

**E. The RDEIR Fails to Analyze and Mitigate Project Air Quality Impacts Adequately**

I14-28

The RDEIR fails to analyze and mitigate the air quality impacts of the projected increase in dairies and feedlots and their associated emissions in Tulare County adequately. A recent study on Ozone production in the San Joaquin Valley found that reactive organic gas (ROG) from livestock feed dominates the ROG contributions to ozone formation in the Valley.<sup>6</sup> The contribution was higher than that of light duty vehicles in the Valley.<sup>7</sup> Table 3.3-1 should be amended to include livestock feed as a major pollutant source of Ozone. In addition, the Project should discuss the potential environmental impacts from increased dairies in the Valley and the possible mitigation measures. Impacts 3.3-2 and 3.3-3 incorrectly state that no additional mitigation measures are available for the potential project impacts of a net increase of criteria air pollutants or obstruction of implantation of an air quality plan. Simply relying on the San Joaquin Valley Unified Air Pollution Control District's Rule 4570 to mitigate dairy and feedlot emissions is not sufficient. There are other feasible mitigation measures that could reduce the impact of livestock feed emissions. For example, the County could require new and expanding dairies within the County to build enclosed barns with a biofilter or other pollution capturing mechanisms. This is a feasible mitigation measure that would not only decrease the emissions from dairies and feed lots, but it has been shown to improve milk production and increase breeding success in hot weather.<sup>8</sup> In addition, the County should consider the potential for the Project to create or contribute to a toxic "hot spot."

In addition, we suggest the following additional considerations to the policies and implementation measures.

I14-29

**AQ-1.1: Cooperation with Other Agencies** - The County commits to cooperating with other agencies in developing an implementing regional air quality plans. The Implementation Measures (Numbers 1 and 2) are very vague as to how this will be accomplished. Tulare County sits on the San Joaquin Valley Air Pollution Control Board and is already required to cooperate in regional efforts to reduce pollution. The County should create concrete policies that reduce pollution by creating an emissions cap for the

<sup>6</sup> Howard, Cody J., Kumar, Anuj, et. al., Environ. Sci. & Technol.: *Reactive Organic Gas Emissions from Livestock Feed Contribute Significantly to Ozone Production in Central California*, Vol. 44, No. 7 (2010) 2309-2314.

<sup>7</sup> *Id.*

<sup>8</sup> Powers, William E., Expert Report (Dec. 2007).

County, specify particular uses, reducing energy production and consumption in the County, creating policies to retrofit buildings to be more energy efficient, etc.

I14-29  
cont'd

**AQ-1.3: Cumulative Air Quality Impacts** - This policy merely reiterates requirements in the CEQA. In order to implement this policy the County should create policies that prioritize projects that reduce or do not increase local or regional pollution. The County could create Green Tape policies that expedite project approval that meet specific demonstrated environmental benefits. The County could also create emissions caps for areas of the County already overburdened with pollution sources.

I14-30

**AQ-1.6: Purchase of Low Emission/Alternative Fuel Vehicles** - According to this policy the County will encourage departments to replace existing vehicles with low emission/alternative fuel vehicles. However, the County qualifies this commitment with a vague reference to “as appropriate.” Furthermore, under Implementation Measure 7 which deals with the policy, the County will only review the performance and maintenance records of its existing hybrid and alternative fuel vehicles fleet. The County should strengthen this policy by removing the “as appropriate” language. The County should also strengthen the implementation measure by requiring existing inefficient fleets to be replaced by hybrid or alternative fuel vehicles. The County should also create an implementation measure to encourage or incentivize the development of an alternative fuel infrastructure i.e. CNG filling stations. This would allow the County to increase its use of alternative fuel vehicles and make it more feasible for the County to require alternative fuel vehicle use as conditions of project approval. These policy and implementation measure changes would also help the County mitigate its greenhouse gas emission impacts.

I14-31

**AQ-2.3: Transportation and Air Quality** - The County will work with TCAG to study methods of transportation which may contribute to a reduction in air pollution. The policy also suggests several public transportation alternatives. However, another aspect of transportation design includes using the County’s land use authority to require developers to build projects that reduce vehicles mile traveled (VMTs). Developments that encourage sprawl and create mazes of streets and cul de sacs increase VMTs and contribute to air pollution. The County could create policies to disallow this type of development as part of its transportation design policies.

I14-32

**AQ-3.6: Mix Land Uses** - The County states that it will encourage the mixing of land uses. However, there is no implementation measure for this policy. The County is requiring mix zoning in hamlets which will require a change in the Zoning Ordinance. Also, the County could create an implementation measure which would give priority to the mixed use projects.

I14-33

**F. The RDEIR Fails to Analyze and Mitigate Project Energy Impacts Adequately**

I14-34

The California Natural Resources Agency recently reaffirmed that “CEQA’s requirement to analyze and mitigate energy impacts of a project is substantive, and is not merely procedural.”<sup>9</sup> Pursuant to CEQA Greenhouse Gas Guidelines promulgated under SB 97, Appendix F of the Guidelines was revised to clarify that an EIR *shall* consider energy implications of the proposed project, and where applicable, items that should be

<sup>9</sup> Resources Agency, Final Statement of Reasons for Regulatory Action at 71 (Dec. 2009).

considered include the energy supply and energy use patterns of the region, the effects of the project on local and regional energy supplies, and measures to reduce energy consumption. (CEQA Guidelines, Appendix F.)

I14-34  
cont'd

The RDEIR fails to conform to Appendix F because its description of Project energy use is limited to noting the PG&E supplies the County with electricity and natural gas. To properly assess the Project's energy consumption, the County should provide information on the extent to which on-site renewable energy is being used in the County, and discuss whether the County currently has any programs or requirements relating to energy efficiency, renewable energy or green building requirements.

The RDEIR's conclusion that Project energy impacts are not significant fails because it is based entirely on a series of vague and aspirational measures aimed at reducing energy consumption. For example, in concluding that the Project would not result in the wasteful, inefficient, or unnecessary consumption of energy in the construction and operation of new buildings, the RDEIR references the following measures:

I14-35

**LU-7.15:** The County shall *encourage* the use of solar power and energy conservation building techniques by all development.

**LU Implementation Measure #24:** The County shall review LEED and LEED-ND certification requirements and develop an implementation program.

**AQ-3.5:** The County shall *encourage* all new development, including rehabilitation, renovation, and redevelopment, to incorporate energy conservation and green building practices to maximum extent feasible.

**AQ Implementation Measure #12:** The County shall *encourage* LEED and LEED-ND certification for new development or similar rating system....

**PFS-5.9:** The County shall *investigate* waste disposal and reuse needs for agricultural wastes for energy and other beneficial uses and shall change County plans accordingly.

**ERM-4.1:** The County shall *encourage* the use of solar energy, solar hot water panels, and other energy conservation and efficiency features in new construction and renovation of existing structures in accordance with State law.

**ERM-4.2:** The County shall *promote* the planting and maintenance of shade trees along streets and within parking areas of new urban development to reduce radiation heating.

**ERM-4.3:** The County shall *participate, to the extent feasible*, in local and State programs that strive to reduce the consumption of natural or man-made energy sources.

**ERM-4.4:** The County *should coordinate* with local utility providers to provide public education on energy conservation programs.

**ERM-4.6:** The County shall *support* efforts, when appropriately sited, for the development and use of alternative energy resources .....

(See RDEIR at 3.4-29-30.) Because each of these measures is framed in unenforceable, aspirational language, not a single one of the measures supporting the RDEIR's less than

significant determination provides any degree of certainty that they will ultimately function to reduce energy consumption. Additional measures identified in the RDEIR to purportedly “ensure that this impact remains less than significant” similarly provide no assurance that energy consumption will actually be reduced. (RDEIR at 3.4-30). Measure ERM-4.7 calls for the continued integration of “energy efficiency and conservation into all County facilities” but fails to provide any guiding standards or requirements. Similarly, ERM-4.8 simply calls on the County to “*encourage*” new development to exceed minimum state efficiency standards without setting any requirements.

I14-35  
cont'd

In addition, while the County states it wants to attract energy resource development (ED-3.1: Diverse Economic Base), there are no criteria for what type of energy development. The County should encourage the development of renewable energies that provide a true reduction in fossil fuel dependence, such as solar and wind. The County also identifies ethanol as an industry to attract to the County (Economic Development Existing Conditions). Corn-based ethanol is bad public policy in terms of air quality, water supply, and for low income communities raising food security issues. Lastly, the County pledges to provide leadership in economic development with attention to attracting clean industries. (ED 1.1) However, there is no implementation measure for this. The County should examine opportunities for the County to participate in the truly green economy which is growing throughout the State and Country. There are several green jobs initiatives that have been taking place throughout California and throughout the Country. Organizations such as Green Jobs for All are providing support for public and private initiatives that advance green jobs for low income people and people of color as a sustainable pathway out of poverty. Tulare County should adopt building code standards, energy efficiency goals for new development and rehabilitating existing buildings to meet LEED standards. The County should also encourage and incentivize job training programs that build the skills necessary for low income residents and people of color in Tulare County to take advantage of the emerging green economy. The County should work with green jobs initiatives and the Economic Development Corporation to identify clean industries and work to create incentives to attract them to the County along with job training programs to allow local residents to fill these jobs. Jobs in green construction, maintenance and restoration, as well as solar and wind energy production provide a good pathway to higher income jobs as well as provide for a healthier environment. The County should prioritize those types of economic projects.

I14-36

Given their vagueness, uncertainty and lack of enforceability, the RDEIR does not, and cannot, quantify or describe the actual energy conservation benefits that will result from these measures. As noted by the Attorney General in “Climate Change, the California Environmental Quality Act, and General Plan Updates: Straightforward Answers to Some Frequently Asked Questions, California Attorney General’s Office,” “[w]hile a menu of hortatory GHG policies is positive, it does not count as adequate mitigation because there is no certainty that the policies will be implemented.”<sup>10</sup> Accordingly, there is no legitimate basis to conclude Project energy impacts are less than

I14-37

<sup>10</sup> California Attorney General, Climate Change, the California Environmental Quality Act, and General Plan Updates: Straightforward Answers to Some Frequently Asked Questions at 5 (2009).

significant. Indeed, it appears that the County does not have a single specific and enforceable policy to reduce non-renewable energy consumption.

I14-37  
cont'd

There are numerous specific policies that the County can implement to ensure that energy consumption is not wasteful. Energy conservation not only reduces greenhouse gas emissions, but results in financial savings in reduced utility and fuel costs to the County, households, and businesses, thereby keeping money circulating in the local economy that otherwise would have been used to pay energy bills. Given the many benefits of energy conservation, local governments across the state have implemented policies to increase use of renewable energy and improve energy conservation. These measures, which the County should consider as mitigation for Project energy and climate impacts, include:<sup>11</sup>

I14-38

- Requiring that all new public buildings meet a minimum LEED silver standard. (*See Alameda County Administrative Code Chapter 4.38, requiring all new County projects meet a minimum LEED Silver rating*);
- Requiring that new residential and commercial development, as well as major remodels of homes and businesses, meet green building standards and are LEED certified and that all new buildings exceed Title 24 energy standards by 25 percent. (*See Town of Windsor Building and Housing Code Article 13, establishing green building standards and ratings for commercial and residential buildings*). Public Resources Code Section 25402.1(h)(2) and Section 10-106 of the Building Energy Efficiency Standards (Standards) establish a process which allows local adoption of energy standards that are more stringent than the statewide Standards. This process allows local governments to adopt and enforce energy standards before the statewide Standards effective date, require additional energy conservation measures, and/or set more stringent energy budgets. Local governments are required to apply to the Energy Commission for approval, documenting the supporting analysis for how the local government has determined that their proposed Standards will save more energy than the current statewide Standards and the basis of the local government's determination that the local standards are cost-effective. Once the Energy Commission staff has verified that the local standards will require buildings to use no more energy than the current statewide Standards and that the documentation requirements in Section 10-106 are met, the application is brought before the full Energy Commission for approval. Numerous local governments have taken advantage of this process. *See [http://www.energy.ca.gov/title24/2005standards/ordinances\\_exceeding\\_2005\\_building\\_standards.html](http://www.energy.ca.gov/title24/2005standards/ordinances_exceeding_2005_building_standards.html)*

<sup>11</sup> Many of these measures were identified in CBD's April 15, 2008 comments on the General Plan Update, which are herein incorporated by reference.

- Requiring building projects to recycle or reuse a minimum of 50 percent of unused or leftover building materials (Alameda County Administrative Code § 4.38.030);
- Offering incentives to encourage green building standards and discourage business as usual construction;
- Requiring energy efficiency and water conservation upgrades to existing residential and non-residential buildings at the time of sale, remodel, or additions. Berkeley's Residential Energy Conservation Ordinance (RECO) is an example of such a measure. (Berkeley's RECO, Berkeley Municipal Code Chapter 19.16.) Under this ordinance, Berkeley establishes ten energy or water conservation measures that residential structures must incorporate. These include measures such as installing ceiling insulation, certain water efficiency technologies to shower fixtures and sink faucets and weatherstripping on all exterior doors. Berkeley Municipal Code Chapter § 19.16.050(B). The ordinance requires the seller to certify that some of these measures have been met prior to the sale or exchange of any residential structure or unit. Berkeley Municipal Code Chapter § 19.16.050(A). Similarly, Berkeley's Commercial Buildings – Energy Conservation Measures requires commercial building owners to conduct an energy audit of their building prior to the sale or major renovation of the building and certify(?) that they have installed energy conservation measures, regarding heating, cooling, water, and lighting systems, among others. Berkeley Municipal Code Chapter §19.72.
- Requiring new residential construction to meet specific energy efficiency standards that go beyond those mandated by California law. For example, the City of Rohnert Park recently enacted an ordinance establishing minimum energy efficiency standards for all new low-rise residential construction of any size, low-rise residential additions over a specific size threshold and all residential and non-residential swimming pools and water features. City of Rohnert Park Municipal Code Chapter 14 at § 14.01.010. The ordinance requires residential buildings to include Energy Star appliances and that new and expanded residential structures meet specific energy use standards City of Rohnert Park Municipal Code Chapter 14 at §§ 14.02.050(A); 14.02.060;
- Requiring that all new buildings be constructed to allow for future installation of solar energy systems. In its Community Greenhouse Gas Reduction Plan, the City of Arcata recommended that it adopt such requirements. City of Arcata, Community Greenhouse Gas Reduction Plan (Aug. 2006). Additionally, Chula Vista's Energy Conservation Regulations mandate that all new residential units include plumbing specifically designed to allow later installation of systems that will rely on

I14-38  
cont'd

- Adopting and implementing a Heat Island Mitigation Plan that requires new residential buildings to have “cool roofs” with the highest commercially available solar reflectance and thermal emittance and adopt a program of building permit enforcement for re-roofing to ensure compliance with existing state building code “cool roof” requirements for non-residential buildings. Research shows that “cool roofs” can reduce air-conditioning energy use between 10 and 50 percent (Akbari 2000);
- Integrating renewable energy requirements into development and building standards, such as requiring onsite solar generation of electricity in new retail/commercial buildings and parking lots/garages (solar carports);
- Adopting a resolution or ordinance that will require sources of renewable energy, such as installing solar photovoltaic systems to generate electricity for public buildings and operations<sup>12</sup>; using methane to generate electricity at the wastewater treatment plants; and installing combined heat and power systems.
- Requiring new residential developments to participate in the California Energy Commission’s New Solar Homes Partnership and include onsite solar photovoltaic systems in at least 50% of the residential units (see <http://www.gosolarcalifornia.ca.gov/nshp/index.html>; See also California Public Utilities Commission, New Solar Homes Partnership Guidebook, Second Edition (July 2007);
- Using Geographical Information Systems (GIS) to map and assess local renewable resources, the electric and gas transmission and distribution system, community growth areas anticipated to require new energy services, and other data useful to deployment of renewable technologies;
- Identifying possible sites for production of energy using local renewable resources such as solar, wind, small hydro, biogas, and tidal and evaluating potential land use, environmental, economic, and other constraints affecting their development, and adopting measures to protect those resources, such as utility easements, rights-of-way, and land set-asides;
- Offering incentives and investing in developments in hamlets and underserved communities that would reduce vehicle miles traveled. For

I14-38  
cont'd

<sup>12</sup> Under the California Solar Initiative, the California Public Utilities Commission offers different incentives to government agencies, as well as private businesses and residents, for installing certain types of solar power systems. See California Public Utilities Commission, California Solar Initiative Program Handbook (Jan. 2008), available at <http://www.cpuc.ca.gov/puc/energy/solar/> (last visited April 7, 2008).

<ul style="list-style-type: none"> <li>Require an energy audit for County owned buildings and require rehabilitation to make buildings more efficient, taking advantage of state and federal funding programs for assistance.</li> </ul>	I14-38 cont'd
Additional policies that can form the basis for development of specific implementation measures are identified in CAPCOA's "Model Policies for Greenhouse Gases in General Plans" and the Institute for Local Government's Best Practices Framework. <sup>13</sup>	I14-39
CEQA requires the County to adopt all feasible mitigation measures to reduce the Project's significant impacts on climate change and energy consumption. Accordingly, the RDEIR should be revised and recirculated to include specific and enforceable measures to reduce Project energy consumption and resulting greenhouse gas emissions, including the measures references above in the CAPCOA and Institute for Local Government's Best Practices Framework.	I14-40
<p><b>G. The RDEIR Fails to Properly Analyze and Mitigate Greenhouse Gas Impacts</b></p> <p>As the future land-use planning document for the County, general plan policies and land use determinations have profound implications for global warming. The California Air Resources Board has accurately called local governments "essential partners" in implementing AB 32.<sup>14</sup> Leadership by local governments in improving land use patterns and reducing greenhouse gases is a key component in solving the climate crisis. Supporting smart growth style compact development is one of the most important ways to achieve substantial reductions in greenhouse gas emissions. (Urban Land Institute 2008). Addressing climate change through local planning documents also provides other long term benefits to the local planning agency. Smart growth policies that discourage sprawl not only reduce greenhouse gas emissions but also reduce the cost of public services (Carruthers 2007), improve public health, allow for streamlining of future environmental review through the method of tiering to a Program EIR (CEQA Guidelines §§ 15064(h)(3), 15183.5), and facilitate compliance with state greenhouse gas reduction requirements under the Global Warming Solutions Act (AB32) and Executive Order S-03-05.<sup>15</sup> Unfortunately, the General Plan does not appear to take its obligation to reduce greenhouse gas emissions seriously or seem to recognize the many fiscal and quality of life benefits that result from improved land-use planning. We urge the County</p>	I14-41
<p><sup>13</sup> CAPCOA, Model Policies for Greenhouse Gases in General Plans (June 2009); Institute for Local Government, CCAN Best Practices Framework (Feb. 2010), available at <a href="http://www.ca-ilg.org/node/1191">http://www.ca-ilg.org/node/1191</a>.</p> <p><sup>14</sup> CARB, Climate Change Proposed Scoping Plan (Oct. 2008) 26-27.</p> <p><sup>15</sup> See Anders et al, <i>Applying California's AB 32 Targets to the Regional Level: A Study of San Diego County Greenhouse Gases and Reduction Strategies</i>, 37 ENERGY POLICY 2831 (2009) ("Although the largest reductions are achieved through state mandates, all measures, including at the local level, will be required to achieve the AB 32 target.")</p>	

to revisit the RDEIR’s greenhouse gas analysis and develop a climate action plan with a legitimate emissions target, specific and enforceable mitigation and a robust monitoring program.

I14-41  
cont'd

**1. The RDEIR Does Not Sufficiently Explain How Emission Estimates Are Derived**

I14-42

The RDEIR states that vehicular emissions were calculated using estimates by the Tulare County Association of Government’s vehicle miles travelled estimates for 2030. However, it is unclear whether these estimates are tied to the actual land uses envisioned under the General Plan. If not, the RDEIR should be revised to estimate VMT based on the maximum allowable extent and location of growth permitted under the General Plan. Absent this analysis, Project impacts cannot be accurately described and alternatives accurately compared.

**2. Proposed Mitigation for the Project’s Greenhouse Gas Impacts is Vague, Unenforceable, and Improperly Deferred**

I14-43

While the RDEIR properly acknowledges that Project greenhouse gas impacts are significant, it fails to adopt all feasible mitigation and alternatives to minimize this impact as required under CEQA. Pub. Res. Code § 21002. Like its treatment of energy impacts, mitigation for the full range of Project’s greenhouse gas impacts is improperly vague, unenforceable and deferred. As recently set forth by the Court of Appeal in *Communities for a Better Environment v. City of Richmond*, “the novelty of greenhouse gas mitigation measures is one of the most important reasons ‘that mitigation measures timely be set forth, that environmental information be complete and relevant, and that environmental decisions be made in an accountable arena.’” 2010 Cal. App. LEXIS 571, 51-52 (Cal. App. 1st Dist. Apr. 26, 2010) (citation omitted).

Rather than propose meaningful mitigation for the Project’s greenhouse gas impacts in the RDEIR, the General Plan simply provides a policy that the County will develop a climate action plan at some undetermined date that will inventory, mitigate and monitor the County’s greenhouse gas emissions. (RDEIR at 3.4-38-39). No date is set for completion of this plan, no mitigation target set, and no specific measures are proposed. Notably, CBD raised this same concern over two years ago in comments on the DEIR, which similarly called for the future development of a climate action. The County had ample opportunity to develop and adopt a meaningful climate action plan within that time period but has failed to do so. In invalidating an EIR for improperly deferring mitigation of greenhouse gas impacts, the Court in *Communities For a Better Environment v. City of Richmond*, held that the “solution was not to defer the specification and adoption of mitigation measures until a year after Project approval; but, rather, to defer approval of the Project until proposed mitigation measures were fully developed, clearly defined, and made available to the public and interested agencies for review and comment.” 2010 Cal. App. LEXIS 571 (Cal. App. 1st Dist. Apr. 26, 2010). Indeed, were the Climate Action Plan to be developed after general plan approval as currently contemplated, land uses would be locked in that could frustrate attainment of

I14-44

emission reduction objectives. The time to analyze and commit to sustainable, low-carbon growth is when the General Plan is developed, not after.	I14-44 cont'd
---	------------------

<p>Additionally, AQ-1.7 only states that the County will support statewide global warming solutions and monitor ARB's efforts to develop global warming mitigation for local governments to implement as part of AB 32. However, there is no implementation measure associated with this policy. Further, this policy overlooks the fact that independent of ARB, the County as a local lead agency has a duty under CEQA to mitigate direct and indirect impacts from projects in its jurisdiction.</p>	I14-45
--	--------

<p><b>3. The Proposed Climate Action Plan Sets an Improper Target and Fails to Contain Meaningful Policies and Mitigation</b></p>	I14-46
---	--------

Documents released by the County include a Draft Climate Action Plan (CAP) wherein the County asserts it will adopt the CAP "in close proximity and subsequent to the adoption of the General Plan Update." As set forth above, the CAP must be developed and adopted concurrently with the General Plan to conform with CEQA. In addition, the CAP itself falls far short of a plan that could be used for streamlining CEQA review of project-level GHG impacts. (See Guidelines §§ 15064(h)(3), 15183.5.) In particular, the Plan's emission reduction target is not supported by substantial evidence and contrary to available guidance on this issue. Moreover, proposed mitigation measures are deferred and unenforceable. A revised CAP should be recirculated that meets the standards of new CEQA Guideline § 15183.5, which sets specific criteria for climate action plans, and available guidance. The County should also consider Climate Action Plan resources developed by the Bay Area Air Quality Management District (BAAQMD) that can be applied statewide.

<p><b>a. The Proposed Greenhouse Gas Reduction Target is Fatally Flawed</b></p>	I14-47
---	--------

The CAP states that its emission reduction objective "must be set at a level that demonstrates consistency with State targets, but should be feasible for the vast majority of projects to achieve." (CAP at 4.) As set forth in the CEQA Greenhouse Gas Guidelines adopted by the Resources Agency, the target for a greenhouse gas reduction plan is the "level, based on substantial evidence, below which the contribution to greenhouse gas emissions from activities covered by the plan would not be cumulatively considerable." (Guideline § 15183.5.) In other words, the relevant consideration in setting a greenhouse gas target is scientific evidence demonstrating that the target is sufficient to ensure projects compliant with the plan will not have a cumulative impact, not that the target is set at a level to allow the "vast majority" of projects to demonstrate consistency.

The CAP's proposed 29 percent below business as usual emissions reduction target is flawed on numerous grounds. (CAP at 12). First, the CAP's assertion that this target is based on guidance by SJVAPCD and BAAQMD is incorrect. Guidance proposed by SJVAPCD was limited to industrial, residential and commercial projects, not general plans. It also must be noted that the Attorney General opined that the 29% below

business as usual threshold proposed by SJVAPCD “will not withstand legal scrutiny.”<sup>16</sup> The CAP also mistakenly asserts that BAAQMD developed a 28% below business as usual target for general plan. Emission reduction targets for climate action plans identified by BAAQMD for 2020 are 6.6 tons of emissions per capita, a 15 percent decrease from current levels, or reaching 1990 levels.<sup>17</sup> Because the guidance is based on statewide objectives, it is applicable to the Tulare County General Plan Update. Here, the General Plan falls far short of all of these metrics. Emissions per capita for 2030 are 27.4 tons not 6.6 (a number based on 2020 goals, not 2030, which would be lower). Total County emissions by 2030 are 6,105,480 tons, a 20% *increase* from current levels. While the CAP claims that simply calling for a 6% reduction in emissions from new development from an undefined base case scenario is insufficient to ensure the County is consistent with California’s emission reduction objectives, the high per capita emissions and overall increase in emissions from current levels demonstrates otherwise and unmasks the inherent gamesmanship and illegitimacy of the County’s significance criteria.

I14-47  
cont'd

**b. The CAP Fails to Properly Identify and Analyze Emissions Resulting from Specific Actions or Categories of Actions**

I14-48

Not only is the use of a 29% below business as usual target without evidentiary support, but, in calculating the County’s role in meeting this target, it improperly takes credit for a range of state action that has not yet been realized. As set forth in BAAQMD guidance, a climate action plan “should identify and analyze GHG reductions from anticipated actions in order to understand the amount of reductions needed to meet its target.”<sup>18</sup> Rather than do so, the CAP simply asserts that implementation of state measures will result in a 24.2 percent reduction in County emissions. As many of these state measures have not been adopted or specified, and their application to County activities is unclear, there is simply no evidence to support this blanket assertion. While it is appropriate for a CAP to account for state action, this should only be for measures, such as Pavely vehicle mile standards, where there a sufficient level of certainty that the measure will occur and specificity to understand its effect on local GHG emissions.<sup>19</sup> Properly analyzing the extent to which state action will reduce emissions generated locally is critical to understanding additional action that will be needed by local government.

A clear understanding of the potential gap between the results of state action and the County’s emission reduction targets underscores the importance of analyzing climate impacts and alternative development scenarios in the General Plan itself, rather than defer this analysis to a later date. Because the climate action plan would be adopted *after*

<sup>16</sup> Letter from Attorney General to SJVAPCD re: Final Draft Staff Report on Greenhouse Gas Emissions Under CEQA, Nov. 4, 2009.

<sup>18</sup> BAAQMD, CEQA Air Quality Guidelines, May 2010 at 4-10.

<sup>19</sup> BAAQMD, GHG Plan Level Quantification Guidance, April 15, 2010.

approval of the general plan, it is severely limited in its ability to reduce emissions from the transportation sector through better land use planning.	I14-48 cont'd
--	------------------

<b>c. The CAP Does Not Contain Specific Measures That Would Collectively Achieve the Target Emissions Level</b>	I14-49
---	--------

Because the CAP simply incorporates the same set of aspirational and non-binding measures listed in the General Plan, it fails to demonstrate that implementation will result in emissions reductions. Indeed, the CAP does not appear to have a single binding measure that would function to reduce community emissions. As set forth above, there is a vast array of potential measures, such as requiring on-site renewables for projects above a certain number of units, green building standards, and policies prohibiting leapfrog development that can significantly reduce community emissions. Many of these measures are incorporated in CBD's original comments on the DEIR for the General Plan and are herein incorporated by reference.

<b>d. The CAP's Proposal to Monitor Progress is Inadequate</b>	I14-50
--	--------

As set forth in Guideline § 15183.5, it is critical that a CAP establish a mechanism to monitor progress toward its emission target, and to require amendment if that target is not reached. While the CAP states it will develop benchmarks, the mitigation monitoring and reporting lacks specificity and any assurance that it will not be immediately disregarded. For example, BAAQMD Guidance recommends that a CAP should, among other things, identify the department and lead staff in charge of oversight and provide an integrated timeline of implementation of measures.<sup>20</sup> This level of specificity is entirely absent from the Tulare County CAP.

<b>H. The RDEIR Fails to Analyze and Mitigate Project Noise Impacts Adequately</b>	I14-51
--	--------

The County's policy to discourage the intrusion into existing urban areas of new incompatible land uses that produce significant noise, odors, or fumes (LU-1.3) does not include implementation measures designed to address the impact of development that occurs within city limits that intrudes upon county residential areas.

<b>I. The RDEIR Fails to Analyze and Mitigate Project Hydrology, Water Quality and Drainage Impacts Adequately</b>	I14-52
--	--------

**1. Impact 3.6-1: Water Quality**

The RDEIR wrongly concludes that adoption of the current draft Update to the General Plan will have a "less than significant" impact on water quality and compliance with water quality standards in the County.<sup>21</sup> The RDEIR largely ignores the fact that extensive groundwater contamination problems already exist and even goes so far as to

---

<sup>20</sup> BAAQMD, GHG Plan Level Quantification Guidance, April 15, 2010 at 16.

<sup>21</sup> RDEIR, § 3.6, pp.37-40.

downplay the significance of these problems, stating that “high TDS, nitrate, arsenic, and organic compounds such as herbicides, pesticides and fertilizers, as well as instances of radiological parameters such as uranium and radium 228 . . . *are not of significant concern* across most of the sub-basins” of the County.<sup>22</sup> This is in direct contradiction to the Background Report, which documents substantial groundwater contamination in every major watershed in the County.<sup>23</sup> The current draft Update to the General Plan does little to address the fact that existing communities throughout the County already suffer from degraded groundwater resources, and it is substantially likely that ignoring this problem will only exacerbate it. If the County does not acknowledge and address existing groundwater contamination in its land use planning and land and water policymaking, these problems will only intensify, especially as new development places increasing strain on an ever-lowering water table, intensifying contaminant concentrations and competition for those aquifers that remain potable.<sup>24</sup> As the Background Report observes, many water purveyors solve their water contamination problems by “shifting to another area where water quality problems are absent.”<sup>25</sup> Another coping method used by many water providers in the County is to dig deeper wells, but frequently this just means a water system trades a nitrate contamination problem for an arsenic contamination problem.<sup>26</sup> Thus, a significant environmental impact of adopting the Update to the General Plan as drafted is the substantial likelihood that existing County residents will continue to suffer from degraded water quality, that more and more County residents will be negatively affected by contaminated groundwater as time progresses, and that water purveyors will continue to supply water that does not comply with federal and state safe drinking water standards.

<sup>22</sup> RDEIR, p.3.6-27 (emphasis added).

<sup>23</sup> See Background Report, Appendix C, p.7 (observing that in the Kings River Watershed, “there are no communities which are not impacted” by contamination problems, including the residual effects of now-banned fertilizers, pesticides, and herbicides); p.10 (noting that portions of the central valley floor within the Kaweah River Watershed suffer from “man-induced contamination[,]” namely, “nematodecides such as DBCP, herbicides, pesticides and fertilizers . . . [and] industrial chemicals such as dry cleaning solvents and petroleum fuels” and that “petroleum hydrocarbon contamination . . . has further impacted the availability of groundwater for consumptive purposes *in numerous locations*”) (emphasis added); pp.13-14 (noting that “the Tule River Watershed contains the highest population of individuals impacted with lower quality groundwater of any area within the County” and that “[t]he number of wells constructed in [the Lindsay] area which have been successfully designed to avoid groundwater contamination containing [chlorides, nitrates and DBCP] are limited”); pp.17-18 (noting the “unacceptable conditions” of groundwater quality in various locations throughout the Deer Creek/White River Watershed, including nitrates, phenols, salts, arsenic, microsand, hydrogen sulfide, methane and natural gas, which “aggravate[e] the capability to deliver a potable water supply” in “many” wells); see also Background Report, Appendix C, p.7 (noting that Three Rivers in the Foothill Mountain Region currently experiences water quality problems that are “bacteriological, viral, and pathogenic in nature” and that consumption is only “tolerable” for “single family dwellings” that are “equipped with point of entry water treatment units”).

<sup>24</sup> Background Report, Appendix C, p.11.

<sup>25</sup> Background Report, Appendix C, p.10.

<sup>26</sup> See, e.g., Background Report, Appendix C, p.18 (noting that the “common approach” is to drill and develop new wells “with the design capability to select water from identified aquifers meeting current drinking water standards” but that “quantities . . . are limited under this paradigm, as taking water from too shallow of a zone, or too deep a zone, results in significant diminishment of the quality to be delivered”).

The County can take steps to mitigate these negative environmental impacts by amending existing plan policies and drafting additional new plan policies, as follows:

I14-52  
cont'd

## a. Protecting Public Health

I14-53

As drafted, the Plan Update fails to articulate that access to clean, safe, and affordable drinking water is an important goal for the County. Safe drinking water is fundamental to human survival, and as the Background Report documents extensively, many County residents currently lack access to a potable water supply in their homes. For the most part, those same residents are among the County's most economically disadvantaged, and yet they pay disproportionately high water bills for water that is not safe to drink.<sup>27</sup> Although the County government is not directly responsible for serving water to most areas of the County, it should at minimum acknowledge in its General Plan that the provision of safe, affordable drinking water to every County resident is an important County goal. The Plan Update currently contains an implementation measure (Chapter 11, Water Resources, Implementation Measure 20) that serves as an excellent blueprint for a new policy emphasizing the importance of securing clean, safe, and affordable water for all County residents. Building on IM 20, the County should add a new policy to the Plan Update, as follows:

### **WR-\_\_ : Potable, Cost-Efficient Drinking Water**

The County will support water purveyors, other public agencies, schools, IRWMPs, non-profit organizations and community-based groups in their efforts to secure an adequate, potable, and cost-efficient drinking water supply to sustain a high quality of life, especially in unincorporated areas.

**WR-2.6: Degraded Water Resources** – Widespread groundwater contamination throughout the County constitutes an immediate public health threat, especially in disadvantaged communities located in unincorporated areas, where some of the County's most vulnerable residents cannot afford to buy alternative sources of drinking water. As drafted, WR-2.6 does not demonstrate an affirmative desire by the County to help alleviate this public health crisis by developing both short-term and long-term solutions. WR-2.6 should therefore be amended as follows:

I14-54

The County shall encourage and support the identification of degraded surface water and groundwater resources, facilitate interim solutions, and ~~promote~~ require restoration where ~~appropriate~~ possible.

Implementation Measure 20 should also be expanded to implement this newly revised WR-2.6 (Degraded Water Resources), and the suggested new policy above, WR-\_\_ (Potable, Cost-Efficient Drinking Water), as follows:

I14-55

<sup>27</sup> Residents in many communities pay as much as 10% of their household income for water alone. The EPA recommends that 1-1.5% of household income is affordable. See U.S. Environmental Protection Agency, Information for States on Developing Affordability Criteria for Drinking Water, at <http://www.epa.gov/safewater/smallsystems/afforddh.html>.

<p>The County will support TCAG's Regional Blueprint efforts to provide an adequate, <u>potable</u>, cost-efficient, and realizable water supply to sustain a high quality of life. <u>In areas with degraded water quality, the County shall help facilitate interim safe drinking water solutions, especially in unincorporated areas and disadvantaged communities where contaminated water constitutes an immediate public health emergency.</u></p>	<p>I14-55 cont'd</p>
<p>WR-2.6 also needs a new implementation measure that provides a framework for restoring contaminated aquifers. The County should add the following new implementation measure for WR-2.6 to Chapter 11, Water Resources:</p> <p><u>The County shall work with the Regional Board to develop programs to restore contaminated aquifers, such as treating water pumped from the aquifer and recharging aquifers with uncontaminated water to dilute contaminant levels.</u></p>	<p>I14-56</p>
<p><b>b. Helping Unincorporated Areas</b></p> <p>As the sole representative for unincorporated communities, the County has a particular responsibility to help address the needs of residents in these areas. The County should acknowledge this special responsibility in the General Plan Update in the following policies:</p> <p><b>WR-1.8: Groundwater Basin Management</b> – It is important not just that the County take an active role in groundwater basin management, but that it ensure that the needs of disadvantaged communities and hamlets are taken into account in these processes. WR-1.8 should be amended to reflect this responsibility as follows:</p> <p><u>The County shall take an active role in cooperating in the management of the County's groundwater resources and shall ensure that these groundwater management efforts take into account the needs of unincorporated communities.</u></p>	<p>I14-57</p>
<p><b>WR-3.2: Develop an Integrated Regional Water Management Plan</b> – Pursuant to its special responsibility to residents of unincorporated areas, the County should ensure that local IRWMP efforts include and address the needs of disadvantaged communities and hamlets. Thus, WR-3.2 should be amended to include such language:</p> <p><u>The County will participate with other agencies and organizations that share water management responsibilities in the County to enhance modeling, data collection, reporting and public outreach efforts to support the development and implementation of appropriate Integrated <u>Regional</u> Water Management Plans (<u>IRWMPs</u>) within the County. The County shall ensure that local IRWMP efforts include and address the needs of residential water users in unincorporated communities.</u></p>	<p>I14-58</p>
<p>Likewise, Implementation Measure 18 should be amended as follows:</p> <p><u>The County will participate in Integrated Regional Water Management Plans and ensure that all areas of the County are included.</u></p>	<p>I14-59</p>

c. Contamination Prevention

I14-60

The current draft Update to the General Plan’s policies and implementation measures retain a myopic focus on soil erosion as the sole source of water contamination, largely ignoring the primary sources of groundwater contamination in this County: the application of pesticides, herbicides, and fertilizers to agricultural crops, improper disposal of dairy waste and industrial chemicals such as petroleum fuels and dry cleaning solvents, and leaking septic systems.<sup>28</sup>

**WR-2.3: Best Management Practices (BMPs)** – As written, this policy appears to apply a much more stringent standard to construction activities and urban runoff than WR-2.7 (Industrial and Agricultural Sources) applies to other potential sources of surface and groundwater contamination, such as dairies and food processing facilities. The County should ensure that *all* land uses that are significant sources of non-point source pollution are implementing best management practices and mitigation measures, not just construction and urban runoff. Therefore, WR-2.3 should be amended as follows:

I14-61

The County shall, in coordination with the Water Quality Control Board, continue to require the use of feasible BMPs and other mitigation measures designed to protect surface water and groundwater from the adverse effects of ~~construction activities and urban runoff~~ in coordination with the Water Quality Control Board land uses that are potential sources of non-point source pollution, including construction activities, urban runoff, and agricultural and industrial concerns.

**WR-2.1: Protect Water Quality** – This policy is appropriately expansive, acknowledging the water contamination risks associated with the “discharge of potentially harmful substances” and “ground leaching from storage of . . . wastes[,]” but WR-2.1’s implementing measures deal exclusively with soil erosion from new development. This is true of WR-2.6 (Best Management Practices) as well. WR-2.1 and WR-2.6 need additional implementation measures that will help protect groundwater from the discharge of harmful substances (*e.g.*, excessive fertilizer application) or the leaching of wastes (*e.g.*, dairies) through Best Management Practices and mitigation measures. Therefore, the County should add the following new implementation measure to Chapter 11, Water Resources, to implement WR-2.1 and WR-2.6:

I14-62

The County shall work with the Regional Board to protect groundwater from the discharge of harmful substances or the leaching of wastes, such as by requiring Best Management Practices (BMPs) and mitigation measures from industrial and agricultural concerns.

The County should also clarify that Implementation Measure 24 also implements WR-2.1 (Protect Water Quality) explicitly. (IM 24 is currently listed as implementing only WR-3.9 (Critical Water Supply Areas).) This is a good implementation measure that opens the door to County regulation (prohibition) of land uses “with the potential to

I14-63

<sup>28</sup> See Background Report, Appendix C, pp. 7, 10.

discharge harmful pollutants” or otherwise degrade water quality, so the Update to the General Plan should explicitly link it to WR-2.1.	I14-63 cont'd
--	------------------

<b>d. Water Quality Monitoring, Data Collection, &amp; Designation</b>	I14-64
--	--------

More data on groundwater quality throughout the County are desperately needed in order to make informed water and land use policy decisions.

<p><b>WR-1.2: Groundwater Monitoring</b> – This is a good policy, as it will help ensure that potentially polluting entities identify possible sources of groundwater contamination before the problem becomes widespread, and the information generated by such monitoring will contribute toward and increase the County’s available groundwater quality data. WR-1.2 is weakened by the current language of Implementation Measure 5, however. Rather than just directing the County to “develop groundwater-monitoring partnerships with local groundwater users and developers[,]” IM 5 should also build on WR-1.2’s language regarding linking project approvals to the collection of groundwater monitoring data. For example, IM 5 could be amended to read as follows:</p>	I14-65
--	--------

The County shall encourage active participation by local stakeholders, ~~and~~ develop groundwater-monitoring partnerships with local groundwater users and developers, and impose monitoring requirements, such as participation in county groundwater monitoring programs, as a permit condition for projects identified as potentially impacting groundwater or surface water.

<p><b>WR-1.7: Collection of Additional Groundwater Information</b> – This policy is important, because we need to develop more comprehensive data regarding both water supply <i>and</i> water quality for all regions of the County in order to make informed land use decisions. To this end, the County should require all new supply wells, for both residential and agricultural uses, to test for priority contaminants. Implementation Measure 8 should be amended as follows to include this requirement:</p>	I14-66
---	--------

The County shall encourage responsible agencies and organizations to install and monitor additional groundwater monitoring wells in areas where data gaps exist. County staff shall also adopt an ordinance requiring, as a condition of permit approval, that all newly constructed private wells test for priority contaminants, as determined by the Environmental Health Department.

<p><b>WR-2.9: Private Wells</b> – This is a very good policy, but it needs additional implementation measures. First, even properly-constructed private wells need ongoing maintenance and monitoring, so Implementation Measure 9 should be amended as follows:</p>	I14-67
--	--------

The County will research the development of an education program to inform homeowners in the Valley and Mountain areas regarding water quality concerns. The County shall also work with local community groups to provide assistance and guidance to private well owners on well construction, monitoring, treatment, protection, and rehabilitation.

Second, the Plan Update should also address proper abandonment of unused or “dry” wells, which are known vectors of groundwater contamination that threaten public health and both public and private groundwater supplies. To this end, Implementation Measure 17 should be amended as follows:

I14-68

The County shall amend the well ordinance to require deeper seals in areas of known contaminants. The County shall also identify and direct the proper abandonment of unused wells.

**WR-3.9: Establish Critical Water Supply Areas** – This is a very good policy, as formal designation is an important precursor to protecting vulnerable areas and ultimately restoring them, where possible. However, the County should amend this policy to expand its coverage to include (or clarify that it does in fact already encompass) areas that have degraded groundwater quality, regardless of whether those areas do or do not currently supply a community or municipality with drinking water. Groundwater contamination is not static: contaminated areas are a threat to those areas that still contain good-quality groundwater, as human-induced groundwater contaminants are known to spread and drift. Furthermore, formal designation will contribute positively toward future water and land use planning, as regions with contaminated groundwater should not be targeted for land uses that must rely on clean water, such as residential development.

I14-69

To the extent that the County has intended to create two separate regulatory regimes for vulnerable water *quantity* areas on the one hand (pursuant to WR-3.9), and vulnerable water *quality* areas on the other hand (pursuant to WR-2.6, Degraded Water Resources), this is a misguided approach. Issues related to water quality and water quantity are frequently intertwined, especially in the context of drinking water, and it does not make administrative or institutional sense for the County to bifurcate designation and regulation of vulnerable and compromised areas according to whether the vulnerability centers around quantity versus quality. Rather, pursuant to WR-3.9, the County should move forward with designating all areas that are “critical” to supplying a sufficient quantity of safe drinking water, including mapping and labeling areas of the County with known groundwater contamination and designating those areas for special treatment. Once such areas are designated, the County should institute protective measures for the health and safety of current water users and precautions against further contamination, such as restricting land uses and requiring best management practices in designated areas, particularly when communities rely on that aquifer for drinking water.

I14-70

To clarify this, the County should amend WR-3.9 as follows:

The County shall designate Critical Water Supply Areas to include the specific areas used by a municipality or community for its water supply system, areas critical to groundwater recharge, and other areas possessing a vital role in the management of the water resources in the County, including areas suffering from degraded groundwater quality.

Implementation Measure 24 should likewise be amended to implement this expansive purpose of WR-3.9 designation (which is not just to protect and facilitate groundwater recharge, but also to protect the *quality* of drinking water supplies). Since we are recommending several amendments to IM 24 based on several different comments to

I14-71

several different plan policies in this joint letter, for clarity, our recommended additions to IM 24 that are relevant to *this* comment are highlighted below in bold, in order to distinguish from our recommended additions to IM 24 discussed in later comments:

114-71

The County shall protect groundwater recharge areas in the County by carefully regulating the type of development within these areas, **and the County shall protect designated Critical Water Supply Areas in the County, especially where an aquifer is used to supply drinking water to residential users, by carefully regulating land uses within these areas to protect water quality.** Regulations may include, but are not limited to, the limitation of structural coverage and impervious surfaces, **imposition of Best Management Practices requirements,** and prohibition of uses with the potential to discharge harmful pollutants, increase erosion, or create other impacts degrading water quality or affecting groundwater supply. The County shall also encourage the development of joint-use projects, where groundwater recharge areas serve a dual purpose as parks or recreation areas, especially in unincorporated communities and hamlets.

## 2. Impact 3.6-2: Groundwater Supply

114-72

The RDEIR wrongly concludes that adoption of the current draft Update to the General Plan will have a “significant but unavoidable” impact on groundwater supply.<sup>29</sup> The current draft Update to the General Plan envisions new development in the County, including substantial conversion from agricultural to urban land use, and the RDEIR acknowledges that this will have a significant, detrimental environmental impact on current groundwater supply in the County. The RDEIR is wrong in concluding that this impact is unavoidable, however. The current draft Update to the General Plan does not include sufficient policies to mitigate these impacts, but such policies *are* possible. The County can better mitigate the significant impacts of future development and land use conversion by amending existing plan policies and drafting additional new plan policies, as follows:

### a. Reversing Overdraft

114-73

Groundwater overdraft is a serious problem in Tulare County that we cannot afford to ignore, so the County’s policies on groundwater withdrawals (WR-1.1) and water conservation (WR-3.6) are extremely important. As currently drafted, however, these policies and their implementing measures are insufficient. The County needs to add an additional policy to the Plan Update specifically addressing conditions of overdraft, with corresponding implementation measures that will lead to meaningful regulation of all significant groundwater extraction in those areas of the County that are known to be experiencing overdraft.

At minimum, the County should develop an ordinance regulating all *new* development in overdraft areas, namely, imposing impact fees and requiring effective mitigation measures for groundwater extraction as a condition for permit approval. The County should especially impose such requirements where land is converted from

114-74

<sup>29</sup> RDEIR, § 3.6, pp.37, 40-47.

agricultural to urban use, as this conversion carries the risk of increasing groundwater overdraft. Section 16.54 of the City of Visalia’s Municipal Code, namely, the City of Visalia Water Resource Management and Groundwater Overdraft Mitigation Fee Ordinance, can be used as a model for a similar ordinance by the County. | I14-74

The County should also take the initiative to regulate *existing* groundwater users in overdraft areas, however, because even if groundwater overdraft were merely to continue at its current pace due to existing consumption patterns by existing users, the County is facing a severe water shortage crisis in the future and placing the future health and safety of County residents at risk. Specifically, the County should develop an ordinance requiring private well owners in overdraft areas to adopt water efficiency measures and/or pay a volumetric mitigation fee to fund water efficiency and recharge projects to help mitigate the impacts of groundwater overdraft in disadvantaged communities. Again, the City of Visalia’s overdraft mitigation ordinance can serve as a useful starting point in drafting such an ordinance. | I14-75

The County should thus adopt a new policy along the following lines: | I14-76

**WR-\_\_ : Groundwater Overdraft**

The County shall regulate those areas of the County where groundwater extraction exceeds groundwater recharge, with the goal of reducing and ultimately reversing groundwater overdraft conditions in these areas.

The County should also adopt a corresponding new implementation measure for this new policy to Chapter 11, Water Resources: | I14-77

County staff shall develop an ordinance imposing impact fees and requiring effective groundwater extraction mitigation measures as a condition for project approval in areas of known overdraft. New land uses that result in increased groundwater extraction will be restricted unless there is a clear demonstration that these impacts can be mitigated. County staff shall also adopt an ordinance imposing a volumetric impact mitigation fee on existing private well owners in areas of known overdraft. Such fees could be reduced in exchange for the adoption of effective mitigation measures. Proceeds from impact fees for both ordinances shall be used to fund water efficiency and recharge projects in disadvantaged communities.

**WR-3.6: Water Use Efficiency** – With respect to those areas of the County that are not currently experiencing overdraft conditions, WR-3.6 and Implementation Measure 10 provide a solid framework for helping to prevent overdraft conditions from spreading through a combination of public education, regulation, and incentive-based programs to achieve water conservation. As currently drafted, however, IM 10’s reference to incentives is confusing, if not meaningless, and it unnecessarily isolates incentive-based programs to new development, when existing groundwater users could clearly benefit from incentive-based programs as well. (Effective water conservation will require cooperation among all stakeholders, most of whom are existing water users.) Therefore, IM 10 should be amended to add the following language, which helps clarify that all categories of existing groundwater users are encouraged to engage in conservation measures: | I14-78

<p>The County shall incorporate provisions, <del>including evaluating incentives</del>, for the use of reclaimed wastewater, water conserving appliances, drought tolerant landscaping, and other water conservation techniques into the County's building, zoning, and subdivision ordinances. <u>The County shall also develop incentive-based programs and provide assistance to existing agricultural, industrial, and residential water users to implement conservation measures and technologies, such as water meters.</u></p>	<p>I14-78 cont'd</p>
<p><b>WR-1.1: Groundwater Withdrawal</b> – We note that WR-1.1 appears to have a typographical error – “migrate” should be replaced with “mitigate”, as follows:</p> <p>The County shall cooperate with water agencies and management agencies during land development processes to help promote an adequate, safe, and economically viable groundwater supply for existing and future development within the County. These actions shall be intended to help the County <del>migrate</del> <u>mitigate</u> the potential impact on ground water resources identified during planning and approval processes.</p>	<p>I14-79</p>
<p><b>WR-3.1: Develop Additional Water Sources</b> – We appreciate the modifications the County has made to this policy, which now acknowledges the importance of recharge and infiltration as a component of County-wide water conservation initiatives. This policy should be paired with a win-win implementation measure that encourages the development of joint-use projects, where recharge areas can serve a dual purpose as parks or recreation areas, especially in unincorporated communities and hamlets that currently lack such communal spaces for neighborhood children and families. This language can be added easily to the end of Implementation Measure 24. Since we are recommending several amendments to IM 24 based on several different comments to several different plan policies, for clarity, our recommended additions to IM 24 that are relevant to <i>this</i> comment are highlighted below in bold, in order to distinguish from our recommended additions to IM 24 discussed in preceding comments:</p> <p>The County shall protect groundwater recharge areas in the County by carefully regulating the type of development within these areas, <u>and the County shall protect designated Critical Water Supply Areas in the County, especially where an aquifer is used to supply drinking water to residential users, by carefully regulating land uses within these areas to protect water quality.</u> Regulations may include, but are not limited to, the limitation of structural coverage and impervious surfaces, <u>imposition of Best Management Practices requirements,</u> and prohibition of uses with the potential to discharge harmful pollutants, increase erosion, or create other impacts degrading water quality or affecting groundwater supply. <u><b>The County shall also encourage the development of joint-use projects, where groundwater recharge areas serve a dual purpose as parks or recreation areas, especially in unincorporated communities and hamlets.</b></u></p>	<p>I14-80</p>
<p><b>WR-1.3: Water Export Outside County</b> – This policy should be drafted as restrictively as possible, because Tulare County already suffers from water supply shortages. To this end, Implementation Measure 1, which implements WR-1.3, should remain obligatory for the County and should include a time limit on groundwater export contracts so that these contracts can be reviewed periodically:</p>	<p>I14-81</p>

<p>County staff shall develop an ordinance that will regulate the permanent extraction and exportation of groundwater from Tulare County. The ordinance will set up a permit process for groundwater export, <u>which permits shall be valid for no more than ten years and subject to de novo review prior to renewal</u>. Conditions considered for this permit will include . . . [conditions omitted here to save space].</p>	<p>I14-81 cont'd</p>
<p><b>WR-3.12: Joint Water Projects with Neighboring Counties</b> – New water contracts and new canals and pipelines are certainly necessary to develop supply, but joint initiatives with neighboring counties should also prioritize conservation and groundwater recharge, which are important aspects of matching supply with demand, especially as the population in the San Joaquin Valley grows. WR-3.12 should be amended to acknowledge this:</p> <p>Tulare County will work with neighboring counties to promote development of joint water projects, such as a cross-valley canal, and other efforts to expand water supply, <u>including conservation measures</u>.</p>	<p>I14-82</p>
<p><b>WR-1.4: Conversion of Agricultural Water Resources (&amp; WR-3.3 Adequate Water Availability)</b> – In its latest revisions to the Update to the General Plan, the County has made changes to WR-1.4 that muddle its meaning. WR-1.4 should be amended for greater strength and clarity, as follows:</p> <p>For new urban development, the County shall <del>discourage</del> <u>restrict</u> the transfer of water used for agricultural purposes (within the prior ten years) for domestic consumption <u>unless certain conditions are met</u>, including but not limited to the following:</p> <ul style="list-style-type: none"> <li>• The water remaining for the agricultural operation is sufficient to maintain the land as an economically viable agricultural use, <u>and</u></li> <li>• The reduction in infiltration from agricultural activities as a source of groundwater recharge will not significantly impact the groundwater basin.</li> </ul> <p>Changing “discourage” to “restrict” will make this important policy much more effective and meaningful in terms of mitigating groundwater overdraft in the County.</p>	<p>I14-83</p>
<p>Both WR-1.4 and WR-3.3 will help ensure that adequate water supplies are maintained for existing communities and land uses, first and foremost, and that our County remains agricultural, but they need an effective implementation measure. To achieve this purpose, Implementation Measure 19, which currently implements only WR-3.3, should be expanded to incorporate WR-1.4’s conditions (and implement WR-1.4), as follows:</p> <p>The County shall adopt an ordinance to require new development proposals to provide a Will-Serve letter as part of the application process and suitable evidence of long-term water availability, <u>namely, at least twenty years of supply</u>, prior to approval of the tentative map or other entitlement. <u>Water used for agricultural purposes within the prior ten years will not be considered available unless each of the following conditions are met: (1) the water remaining for the agricultural operation is sufficient to maintain the land as an economically viable agricultural use, and (2) the reduction in infiltration from agricultural activities as a source of groundwater recharge will not significantly impact the groundwater basin.</u> For subdivisions proposing to use well water, the new ordinance shall evaluate current waiver provisions and evaluate well pump test requirements to demonstrate water supply capabilities.</p>	<p>I14-84</p>

This change will strengthen and better implement *both* policies (WR-1.4 and WR-3.3).

I14-84  
cont'd

**b. Public Education and Outreach**

I14-85

**WR-3.8: Educational Programs** – This is an important policy, but it should be clarified that these educational programs will be directed at agricultural and industrial water users in addition to residential water users, because all stakeholders in the county will need to engage in behavioral changes in order for efforts at water conservation and water quality restoration to be effective. Additionally, WR-3.8 conflicts with its implementation measure (#23), because the policy suggests the County will merely play a supportive role, encouraging other agencies to develop educational programs, while the implementing measure suggests the County itself will take the lead in developing such programs. The policy should be amended to resolve this inconsistency in favor of shared responsibility. Finally, although we appreciate the County’s efforts to expand this policy to incorporate public education on water quality issues in its latest revisions to the Plan Update, as currently drafted the policy is somewhat confusing on this point. Therefore, WR-3.8 should be amended as follows:

The County shall ~~develop~~ encourage the development of educational programs, in cooperation with ~~both~~ by water purveyors, other and public agencies, and community-based groups, in order to increase public awareness among residential, agricultural, and industrial water users regarding of water conservation and groundwater protection opportunities and the potential benefits of implementing conservation measures and programs including water quality protection measures.

Implementation Measure 23, which implements WR-3.8, is a great start but should be expanded slightly. There are feasible measures that can be taken to protect our water supplies in the County and ensure clean water into the future, and these should be articulated here. Furthermore, public education efforts are useless if the information is not conveyed in a language that the intended recipients can understand. Therefore, IM 23 should be amended as follows:

I14-86

The County shall develop an education program to inform residents of water conservation and contamination prevention techniques, such as wellhead protection, proper fertilizer application, and septic maintenance, and the importance of water quality and adequate water supplies. Programs may include informational flyers, community workshops, technology transfer fairs, and other various means of education and information dissemination. Outreach and communications shall be conveyed in both English and Spanish, and other languages where appropriate.

**3. Impact 3.6-4: Storm Water Drainage**

I14-87

The RDEIR wrongly concludes that adoption of the current draft Update to the General Plan will have a “less than significant” impact on the capacity of storm water drainage systems in the County.<sup>30</sup> The RDEIR largely ignores the fact, acknowledged in the Background Report, that many unincorporated communities currently suffer from

<sup>30</sup> RDEIR, § 3.6, pp.37, 50-52.

inadequate storm water drainage infrastructure that leads to extensive flooding in streets, parking lots, schools, homes and businesses during the rainy season.<sup>31</sup> Given that existing runoff from existing development already exceeds the drainage capacity of these communities, new development pursuant to the Update to the General Plan cannot but further worsen this problem by contributing to runoff. Furthermore, the current draft Update to the General Plan does little to address the fact that existing communities throughout the County already suffer from storm water drainage problems, and it is substantially likely that ignoring this problem will only exacerbate it, even if no further development takes place within these drainage-troubled areas. Thus, a significant environmental impact of adopting the Update to the General Plan as drafted is the substantial likelihood that existing County residents will continue to suffer from flooding caused by insufficient storm water drainage infrastructure and that increasing numbers of County residents will be negatively affected by drainage problems as time progresses.

I14-87  
cont'd

The County can take steps to mitigate this negative environmental impact by amending existing plan policies and drafting additional new implementation measures that address existing drainage problems, as follows:

I14-88

**PFS-4.1: Stormwater Management Plans** – This is an important policy, but as drafted it lacks any real meaning or strength, so it should be revised as follows:

The County shall ~~consider the preparation and adoption of~~ prepare and adopt stormwater management plans for communities and hamlets to reduce flood risk, protect soils from erosion, control stormwater, and minimize impacts on existing drainage facilities, and develop funding mechanisms.

Furthermore, this policy lacks any implementation measures. The County should add the following new implementation measures to Chapter 14, Public Facilities and Services, to implement PFS-4.1:

I14-89

The County Resource Management Agency shall identify flooding problems in unincorporated communities and hamlets and seek funding from federal and state agencies.

<sup>31</sup> Background Report, Chapter 7, p.55 (noting that “[m]any of the unincorporated small communities have no underground drainage infrastructure, leaving only surface drainage which is more subject to flooding, and/or not properly functioning due to little or nonexistent facility maintenance”); p.62 (noting that “development that occurred prior to 1972 generally does not have storm drainage infrastructure installed, as is the case for most unincorporated areas of the County[.]” and that “[t]his has led to a need to improve such areas that lack drainage”) (emphasis added); see RDEIR, § 3.6, p. 33 (noting that “[l]ocalized drainage issues occur throughout the County,” that levees have been placed throughout the county to increase available land for agriculture and that these levees “rarely meet current standards for flood protection[.]” that there are “locations where homes or other urban development occurs behind agricultural levees,” that “those areas are likely to experience drainage issues as flood waters are held behind the levee, unable to drain to the river[.]” but concluding that “prevention of development in affected areas has been found to be more effective than fixing such problems through larger levees” – i.e., concluding that it’s more effective to prevent further development in those troubled areas than to solve the levee problem for existing communities in such areas); see also RDEIR, § 3.6, pp.28, 50-52.

The County shall prioritize existing communities and hamlets suffering from flooding and storm water drainage problems for Community Development Block Grant (CDBG) project development and funding, which is overseen by the Community Development and Redevelopment Division of the County Resource Management Agency.

I14-89  
cont'd

The County shall cooperate with water and irrigation districts and unincorporated communities and hamlets that have storm water drainage problems to develop projects to address these issues.

**J. The RDEIR Fails to Analyze and Mitigate Public Services and Utilities Impacts Adequately**

I14-90

**1. Impact 3.9-1: Water Services Infrastructural Capacity**

The RDEIR concludes in Impact 3.9-1 that a “significant but unavoidable” impact of adopting the current draft Update to the General Plan will be the necessity of constructing new or expanded water services infrastructure to meet *future development* needs.<sup>32</sup> Specifically, the RDEIR states that:

Implementation of the proposed project would result in additional County-wide residential and non-residential land use development. *Additional land use development consistent with the proposed project* would . . . in some cases result in insufficient water . . . facilities available to serve some of the unincorporated areas designated for urban development. In other cases, insufficient water treatment and conveyance facilities or water quality issues could result [in an] inability of domestic water service providers to meet water demands.<sup>33</sup>

The RDEIR focuses exclusively on new development, not on existing situations in existing communities.<sup>34</sup> Although the RDEIR incorporates a qualitative evaluation of the capacity of each unincorporated community’s water system (taken from LAFCO MSRs or interviews with individual water providers), that assessment only considers a system’s ability to service *projected growth* in the community.<sup>35</sup> The RDEIR does not consider or measure the adequacy of a domestic water system’s existing infrastructural capacity to serve current customers effectively and affordably, now and into the future. The RDEIR’s only acknowledgment that existing services are important is a throwaway statement that water providers “must not only maintain supplies and facilities to serve existing water users, but also must expand supplies and facilities needed to accommodate

<sup>32</sup> RDEIR, § 3.9, pp. 35-38, 47-50.

<sup>33</sup> RDEIR, § 3.9, p.36 (emphasis added).

<sup>34</sup> The RDEIR makes it clear that the County sees its role with respect to water services to be solely as a coordinator and facilitator ensuring the adequate delivery of water services to *new development*. See, e.g., RDEIR, § 3.9, p.48 (“Current procedures and policies and programs contained in the proposed project would strive to secure adequate water supplies for unincorporated areas within the County *that are designated for urban development* . . .”) (emphasis added); p.49 (“[T]he County will continue to implement a variety of policies and programs designed to coordinate with local water service providers to ensure the provision of an adequate water supply that meets clean, safe water standards *prior to development*.”) (emphasis added); p.33 (“Adequate water supply and facilities are essential if the County is to sustain growth and serve projected increases in employment and population”).

<sup>35</sup> RDEIR, § 3.9, pp.17-18, 34, 37.

planned population growth within each service area.”<sup>36</sup> In other words, according to RDEIR, the standard for existing customers is to maintain the status quo. There is no acknowledgement that the status quo is inadequate, let alone that the Plan Update’s single-minded emphasis on new development and silence with respect to current problems in existing communities might affirmatively contribute toward worsening water service infrastructural problems in existing communities.

I14-90

The County is obligated by CEQA to evaluate *every* potentially significant negative environmental impact associated with adoption of the current draft Update to the General Plan, and one such impact is the increasing deterioration and increasingly inadequate capacity of existing water services infrastructure to serve existing customers in existing communities effectively and affordably. The current draft Update to the General Plan does not include sufficient policies to mitigate these impacts, but such policies are possible. The County can take steps to mitigate this negative environmental impact by amending existing plan policies and drafting additional new implementation measures, as follows:

I14-91

## a. Prioritizing Existing Communities

I14-92

**PFS-1.1: Existing Development & PFS-1.2: Maintain Existing Levels of Services** – These policies are a good start, but the draft Update to the General Plan should prioritize existing communities over new development in *all* areas of the County, not just those limited areas where the County is the water service provider. Therefore, these policies should be amended as follows:

The County shall ~~generally give priority~~ prioritize its resources for the maintenance and upgrading of ~~County owned and operated~~ facilities and services to existing development in order to prevent the deterioration of existing levels-of-service. (PFS-1.1)

The County shall ensure new growth and developments do not create significant adverse impacts on existing ~~County owned and operated~~ facilities. (PFS-1.2)

## b. Affordability and Cost-Sharing

I14-93

**PFS-1.5: Funding for Public Facilities, PFS-1.6: Funding Mechanisms, & PFS-3.7: Financing** – None of these policies mention affordability. Many County residents in unincorporated areas are paying as much as 10% of household income for drinking water alone, which does not even include payment for other services such as solid and liquid waste disposal. The EPA’s National Drinking Water Advisory Council suggests that water systems aim for 1% of median household income as an affordable rate.<sup>37</sup> This is not an easy target for smaller systems, but affordability should at least be included as an explicit goal, in all three of these policies, as follows:

<sup>36</sup> RDEIR, § 3.9, p.36.

<sup>37</sup> See U.S. Environmental Protection Agency, Information for States on Developing Affordability Criteria for Drinking Water, at <http://www.epa.gov/safewater/smallsystems/afforddh.html>.

<p>The County shall implement programs and/or procedures to ensure that funding mechanisms necessary to adequately cover the costs related to planning, capital improvements, maintenance, and <u>efficient, affordable</u> operations of necessary public facilities and services are in place, whether provided by the County or another entity. (PFS-1.5)</p> <p>The County shall use a wide range of funding mechanisms, such as the following, to adequately fund capital improvements, maintenance, and <u>efficient, affordable</u> on-going operations for publicly owned and/or operated facilities:</p> <ul style="list-style-type: none"> <li>• Establishing appropriate development impact fees,</li> <li>• Establishing assessment districts, and</li> <li>• Pursuing grant funding. (PFS-1.6)</li> </ul> <p>The County shall cooperate with special districts when applying for State and federal funding for major wastewater related expansions/upgrades when such plans promote the <u>efficient, affordable</u> solution to wastewater treatment needs for the area and County. (PFS-3.7)</p>	<p>I14-93 cont'd</p>
<p>Implementation Measure 2 is an excellent start for promoting affordable services as a County goal, but the County should also assist and strongly encourage <i>other</i> non-County-owned water purveyors within the County to conduct annual assessments to ensure that water services are affordable, adequate, and sustainable. Therefore, this measure should be amended as follows:</p> <p>The County shall annually review fees related to County-owned and operated facilities and County-provided services to ensure funding levels are both affordable and adequate to sustain these facilities/services long-term, <u>and the County shall assist and encourage other water purveyors to do the same.</u></p> <p>IM 2 should be linked to PFS-3.7, as well. (It currently only implements PFS-1.5 and PFS-1.6.)</p>	<p>I14-94</p>
<p>There are many implementation measures the County could include in the Update to the General Plan to further a policy of affordability, including developing alternative models for cost-sharing for small systems. We suggest that the County add the following new implementation measure to Chapter 14, Public Facilities and Services, to implement PFS-1.5, 1.6, 1.8, 1.16, and 3.7:</p> <p><u>The County shall work with communities and hamlets to identify potential joint funding opportunities, joint management opportunities, and other means by which to join resources. The County shall support feasibility and other project design studies for infrastructure consolidation and take the lead in developing mechanisms to allow small systems to share costs in order to take advantage of economies of scale, thereby keeping rates affordable for basic services.</u></p>	<p>I14-95</p>
<p><b>K. The RDEIR Fails to Analyze and Mitigate Project Impacts on Agricultural Resources Adequately</b></p> <p>The mitigating policies and implementation measures listed by the County under this element are insufficient to address the potential adverse impacts created by the</p>	<p>I14-96</p>

Project. We suggest the following additional considerations to the policies and implementation measures. I14-96 cont'd

**AG-1.11: Agricultural Buffers** - The County will examine the feasibility of buffers between agricultural and non-agricultural uses. In Implementation Measure #9, the County identifies interested stakeholders. There are other Tulare County groups interested in participating as well, such as Safe Air For Everyone (SAFE) who has collaborated with the Tulare County Agricultural Commissioner to impose buffer zones around schools for restricted pesticides, in fact over 1800 Tulare County residents have endorsed the concept of buffer zones to reduce pesticide drift. I14-97

**ERM-1.13: Pesticides** - The County commits to cooperating with state and federal agencies to evaluate side effects of pesticides. The County can also implement this policy by creating buffer zones between agricultural sources and non-agricultural sources to prevent exposure. The County has already taken positive steps in this direction by restricting the application of restricted pesticides near sensitive receptors. But, there might be additional ways to reduce exposure to pesticide drift. Groups such as Safe Air For Everyone are willing to engage with the County around these issues. I14-98

## **L. The RDEIR Fails to Analyze and Mitigate Project Impacts To Existing Underserved Communities** I14-99

A number of community and hamlet residents have submitted a letter commenting on the General Plan and expressing some of their most pressing needs, and we incorporate by reference that letter here. Indeed, the RDEIR's failure to analyze and mitigate project impacts on existing, unincorporated communities implicates federal and state fair housing and civil rights laws because many of the unincorporated communities that suffer the most severe impact and infrastructure deficit are disproportionately latino, african-american and spanish speaking.

Below are some policies and implementation measures that investment should be targeted toward, along with suggested changes that could enhance quality of life for hamlets and existing communities: I14-100

**PF 1.4: Available Infrastructure** - Growth will be encouraged in communities and hamlets with available infrastructure. However, existing communities and hamlets do not have adequate infrastructure to meet current demands. How will the County assist communities and hamlets obtain necessary infrastructure to meet existing and future demands? The County should develop implementation measures that commit the County to assisting communities and hamlets evaluate means of creating management infrastructure and funding tools that allow for local accountability, but may share costs across a number of small communities. Such policies would allow small community service providers to keep costs affordable in low income areas by encouraging or incentivizing consolidation, joint management, revenue sharing, etc....

**PF 2.5 & 3.5: Improvement Standards in Communities & Hamlets** - These policies focus on new developments. The County should address the infrastructure needs of existing communities and hamlets. Implementation Measure 15 recognizes that curbs, gutters, sidewalks, parks, and sewer systems are important for residents' quality of life. The County should adopt policies for impact fees and revenue sharing with Cities which I14-101

could be used to improve existing conditions. The County could also prioritize underserved areas in establishing parks and in allocating funding for curb, gutter, sidewalks or sewer system improvements. Also the County should ensure that new developments within the UDB and HDB of existing communities and hamlets allow all residents to have access to parks and open space as well as any new commercial development. The County's transportation design policies should be linked to this policy as well.

I14-101  
cont'd

**PF 3.6: Becoming a Community** – This policy should take into account places that do not meet the definition of a community or a hamlet, but are established and not planned for under city spheres of influence. For example, Tooleville, which is located within the Sphere of Influence for Exeter. However, Exeter's plans for growth do not encompass Tooleville. Therefore, the County is responsible for planning within Tooleville, but will have to co-ordinate with Exeter on growth in the area rather than the residents of Tooleville. This is untenable given the fact that Exeter has been singularly opposed to including Tooleville in the City or providing any services to the areas, including basic services it currently lacks, such as potable water. While Tooleville kids go to school in Exeter and help bring tax dollars to the City through sales tax and school funding, the City has made it clear that it does not want this area to be part of the City within the next 100 years, nor is it interested in helping provide any of the needed services in the area. Instead the City wants to develop in all other directions, including islands to the South and large swaths directly north of Tooleville. Leaving the planning of Tooleville's future to Exeter is not in Tooleville's best interest. The County should classify Tooleville as a Hamlet or a Community allowing it to develop its own plan for future growth, since the City clearly wants no part in its future.

I14-102

Planning Framework Implementation Measures 18 & 19 delay the creation of Hamlet Plan guidelines and preparation of Hamlet Plans until 2015-2020. Many of these areas have been neglected for years and should not be made to wait longer.

**Planning Framework Implementation Measure 22** - The County pledges to continue to support community/hamlet efforts to secure state and federal funding for projects. However, in some instances the County has not supported local efforts to obtain necessary funding. For example, the County did not support local community efforts to address Deer Creek flooding in Earlimart and Allensworth. The County did not support Alpaugh's efforts to secure state and federal funding to dig a new well to improve the quality of its drinking water. The County should assist local groups to identify potential funding sources, write letters on behalf of the community, and leverage the County's resources and connections to ensure those funding sources are secured.

I14-103

**TC-1.2: County Improvement Standards** - While the County Improvement Standards is mentioned as the guide to road maintenance and construction, there needs to be a clear explanation as to how residents can advocate for their road needs.

I14-104

**TC-1.19: Balanced Funding** - A balanced approach to the allocation of transportation funds in the county transportation system is critical, however, there also needs to be careful consideration and equitable investment particularly to the unincorporated communities that are geographically remote.

I14-105

**TC-4.2: Determine Transit Needs** - We appreciate the desire to work with TCAG, Cities and communities to evaluate and respond to public transportation needs. However, there should be a specific ongoing strategy to evaluate and respond to the

I14-106

needs of the rural, unincorporated communities adequately. One recommendation is to engage more effectively with community service providers and non-profits. Also, this must be ongoing, since traditionally the one “set” time to engage in transit needs is the unmet needs hearings, which traditionally have not been accessible to all working families and residents of the county.

I14-106  
cont'd

**TC-4.3: Support Tulare County Area Transit.** - We applaud the explicit mentioning of providing intercommunity services between unincorporated communities and cities. However, there should be consideration given to implementing an outreach and education strategy to ensure these unincorporated communities have a way to voice their needs, and are adequately informed about county transit services. Similarly, there should be careful consideration to the inclusion of transit hubs that are accessible as transfer points in the rural areas of the county.

I14-107

### **III. The RDEIR’s Alternatives Analysis is Fundamentally Flawed**

I14-108

#### **A. The RDEIR Fails To Consider a Reasonable Range of Alternatives**

Under CEQA, an EIR must consider and analyze a wide-range of alternatives to the project. “Without meaningful analysis of alternatives in the EIR, neither courts nor the public can fulfill their proper roles in the CEQA process.” *Laurel Heights Improvement Ass’n v. Regents of University of California*, 47 Cal.3d 376, 404 (1988). Accordingly, “[a] major function of an EIR ‘is to ensure that all reasonable alternatives to proposed projects are thoroughly assessed by the responsible official.’” *Save Round Valley Alliance v. County of Inyo*, 157 Cal.App.4th 1437, 1456 (2007) (citations omitted). Here, the RDEIR fails to present “a reasonable range of potentially feasible alternatives.” Guidelines § 15126.6(a). In addition, the RDEIR improperly rejects environmentally superior alternatives.

The County’s alternatives are hardly distinguishable. According to the RDEIR, 25 percent of growth will occur in unincorporated areas under the General Plan Update, 20 percent of growth will be placed in these areas under the city-centered alternative, 30 percent of growth will occur in these areas under both the rural communities and the transportation corridor alternative. (DEIR 7-3 to 7-4). The County must consider an alternative that will place almost all growth in incorporated cities and established communities and hamlets. This alternative should consider revenue sharing agreements with the cities in exchange for giving cities control over city-centered development. Additionally, the County must consider alternatives that incorporate strict energy and water conservation measures, require green building practices and mixed-use development and places development near alternative transportation nodes. Such alternatives would result in a significant reduction in greenhouse gas emissions resulting from VMTs and energy consumption. It would also result in fewer greenhouse gas emissions from construction and development, as the County would not have to build new infrastructure throughout the unincorporated areas. These alternatives would meet the County’s basic goals and objectives of its General Plan Update and, therefore, must be considered by the County.

I14-109

The County must also explain its analysis of the alternatives in more detail so that the public and decision-makers can better determine how they would achieve the goals and objectives of the General Plan Update, lessen the environmental impacts resulting from growth and development and why the County eventually chose this General Plan Update, rather than more environmentally-friendly alternatives. Like its treatment of the Project, the alternatives analysis contains no maps or other detail that informs the public and decisionmakers how land use designations would change under the alternative as compared to the proposed Project and existing conditions.

I14-110

**B. The RDEIR Improperly Rejects the Environmentally Superior Alternative**

I14-111

The RDEIR also improperly rejects environmentally superior alternatives. The RDEIR acknowledges that the City-Centered Alternative “would meet all objectives related to the protection of existing open space and agricultural land use” but rejects the alternative on the grounds that “lower levels of anticipated growth and development may make it more difficult to achieve the desired level of reinvestment within existing communities and hamlets.” (RDEIR at 4-19.) However, reinvestment is a question of directing revenue, not simply allowing largely unregulated growth. City-centered growth would provide additional revenue for the County by sparing it the expense of uncontrolled sprawl growth and allowing to it direct needed revenue to hamlets and existing communities.

Hamlets and existing communities have long been ignored by the County and Cities alike. Although these hamlets and communities have been established for decades, many still lack basic infrastructure, such as potable water or adequate sewers. While these communities need some new developments, basic services and infrastructure, unregulated growth is not the solution. The County should consider a plan that places all growth in incorporated cities and established communities and hamlets, emphasizing investments in the most underserved areas.

I14-112

**IV. The RDEIR Must Be Redrafted and Recirculated**

I14-113

CEQA requires recirculation of a revised draft EIR “[w]hen significant new information is added to the environmental impact report” after public review and comment on the earlier draft DEIR. Pub. Res. Code § 21092.1. This includes the situation where, as here, “[t]he draft EIR was so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded.” Guidelines § 15088.5(b)(4). The opportunity for meaningful public review of significant new information is essential “to test, assess, and evaluate the data and make an informed judgment as to the validity of the conclusions to be drawn therefrom.” *Sutter Sensible Planning, Inc. v. Sutter County Board of Supervisors*, 122 Cal.App.3d 813, 822 (1981); *City of San Jose v. Great Oaks Water Co.*, 192 Cal.App.3d 1005, 1017 (1987). An agency cannot simply release a draft report “that hedges on important environmental issues while deferring a more detailed analysis to the final [EIR] that is insulated from

public review.” *Mountain Lion Coalition v. California Fish and Game Comm’n*, 214 Cal.App.3d 1043, 1053 (1989).

In order to cure the panoply of defects identified in this letter, the County will need to obtain substantial new information to assess the proposed Project’s environmental impacts adequately, and identify effective mitigation capable of alleviating the Project’s significant negative environmental impacts. CEQA requires that the public have a meaningful opportunity to review and comment upon this significant new information in the form of a recirculated draft EIR.<sup>38</sup>

### CONCLUSION

Thank you for your consideration of these comments. We look forward to working with the County now and in the future to reach our shared goals of reducing greenhouse gas emissions and protecting biological diversity, public health, and our environment.

I14-114

CBD, CRPE, CWC, and CRLAF wish to be placed on the mailing/notification list for all future environmental decisions regarding this Project. If you have any questions regarding these comments, please do not hesitate to contact Matthew Vespa at (415) 436-9682 x309 or [mvespa@biologicaldiversity.org](mailto:mvespa@biologicaldiversity.org), Sofia Parino at (415) 346-4179 x301 or [sparino@crpe-ej.org](mailto:sparino@crpe-ej.org), or Rose Francis at (559) 733-0219 or [info@communitywatercenter.org](mailto:info@communitywatercenter.org) or Martha Guzman at [mguzmanaceves@crlaf.org](mailto:mguzmanaceves@crlaf.org).

<sup>38</sup> Additionally, the County’s charge of \$500 to get a copy of the Draft Update to the General Plan and the RDEIR seems unreasonably and prohibitively high. Low income residents without internet access were prohibited from obtaining a copy for review. While copies were available at various public libraries, the cost for obtaining a hard copy should have been more reasonable. The County should remedy this when recirculating the revised RDEIR.

- As an interested citizen, I have reviewed most of the General Plan. That doesn't mean I have read all of it! I would say the most important parts addressed are concerning air quality, land use (development), and transportation (vehicles), which are inter-related. | 115-1
- After the first draft of the General Plan was made public in 2008, a letter from Deputy Attorney General Susan Fiering gave a scathing rebuke, listing all the reasons the county had to get serious about greenhouse gases. She was concerned that county emissions of CO2 are expected to increase by 1.7 tons and considers air quality the most important, with vehicular traffic the main factor. She wrote that greenhouse gases affect us by more fires, and increase in health problems and deaths, more dairy cattle dying from heat as temperatures increase, climate change affecting crops such as stone fruit, etc. She writes that the plan leaves land uses and growth to allow market forces to decide and that it considers a narrow range of alternatives, ignoring "smart growth." "Significant but unavoidable" is not satisfactory. She states that no alternatives or enforceable restrictions are given for building projects or land use, but that the state can help the county with needed changes. | 115-2
- A large criticism of the plan is that it is vague, without specifics, measurements, regulations, monitoring or enforcement and "no mitigation measures are available" for change. It seems not much has changed since 2008 in the updated version. For instance, in the air quality section:
- P. AQ1-3 "The county shall require development to be located, designed and constructed in such a manner that would minimize cumulative air quality impacts. Applicants (for development) are to propose alternatives to reduce air emissions."
- Is the county setting standards for approval that are specific, and if possible, measured from a present baseline? What changes are they to make? Are they deciding or are you? What about enforcement of smart growth principles for smaller lots, development in such a manner to be close to shopping, parks, etc.? We are talking about the 25% asthma rate of children living here. Every time you see a toddler, you have to consider their future health. | 115-4
- Consider how weak your plans are:
- P. AQ 1-12 "The county shall encourage LEED (leadership in energy and environmental design) and ND (neighborhood development) certification for new development to promote energy conservation and sustainability."
- P. AQ 3.4 "The county shall encourage ecologically based landscape principles that can improve air quality improving CO2."
- P. AQ 3-5 "The county shall encourage all new development including rehabilitation, renovation, and redevelopment to incorporate energy conservation and green building practices to the maximum extent feasible."
- P. AQ 4.1 "The county shall support air quality attainment plans. Measures will be applied to new development approvals and permits as appropriate."
- Encourage, support, propose alternatives as appropriate – how concrete and regulatory is that? Will anything really change in our air quality? No wonder the Deputy Attorney General calls the county building plans "market driven." In other words, where is any incentive for developers to go much beyond the status quo, or just enough to get by? | 115-5
- Besides air quality issues, the other alarming part of the General Plan concerns land use planning. The one most affecting our area is to take place in "Cotton King" Boswell's Yokohl Valley development at

the eastern base of Badger Hill, extending north to Highway 198 and south to the entrance of the scenic highway to Springville. It is projected to be a planned community of 34,000 inhabitants, with some lots of 1.3 acres, not exactly smart growth. However, the plans shown to the public when the EIR began, showed no shopping or employment opportunities. It would be a bedroom community. The air emissions from driving for most services would back up against the hills to collect and stagnate. Were you aware that is already the case in Three Rivers in the fall until the rainy season? Take a plane ride up the canyon and see for yourself.

I15-5  
cont'd

The other new Urban Development Boundaries where 25% of the growth will take place will also cause more traffic. This would seem to contradict the county "Alternatives to the Proposed Project" (EIR 4-2). "Significant environmental impacts that the county seeks to eliminate or reduce are:

I15-6

- Air quality impacts from increased development and vehicular traffic
- Loss of Agricultural land
- Biological resource impacts resulting from loss of habitat
- Viewshed impacts resulting from increased development
- Groundwater impacts and availability of adequate water supply resulting from increased development

How would air pollution be reduced if all these new urban townspeople drove to major areas for medical services, auto services, hospitals, cultural events, etc.? Will the new areas be self-contained and businesses be encouraged to meet the needs of the public so there is less driving?

I will say the General Plan is a huge effort to compile. Small comments (only suggestions, not regulations) such as ATMs and vending machines at large employee sites, staggering work hrs., carpooling, studying traffic patterns of intersections of high emissions, paving dirt roads, paving or stabilizing shoulders of roads, etc. may help, but are not enough, and not nearly as significant as regulations of new development.

I15-7

Several subjects seemed to be left out, for instance the impact of agriculture, which comprises 23% of our economy, according to the Tulare County Economic Development Department. You do not address the dust of tree shaking during the nut harvest. You do not address the problem of dairies which by your statistics in your inventory in Appendix E, figure 1, measure greenhouse gases as comprising 63% of the county's greenhouse gases. Any equipment with engines such as agricultural also contributes to air pollution, as well as motorboats on Lake Kaweah. How are they regulated?

I15-8

I am upset about land taken out of cultivation for small parcels for homeowners who decide they want to live in the country, known as ranchettes. This is not recognized for what it is, rural sprawl. As they are allowed to locate closer to towns, they contribute to cities growing together such as Exeter and Farmersville. Also, as you allow county land to be annexed to enlarge city boundaries for developers, it gives opportunity to hopscotch over agricultural land instead of infill. City growth needs to be planned growth, not beholden to developers' voracious appetite for profit. County planning, or lack of it, is as much responsible for this as city planning commissions. City planning commissions are not always wise and thinking for future good, such as smart growth and saving ag land for the future food production of our nation.

I15-9

Decisions made now are not just for tomorrow. They are for always. With such feeble attempts at reigning in air pollution with an attitude of "significant but unavoidable," with more cars on the road as each year comes, I see little hope for our county and the health of our residents. It doesn't seem like your plans take air quality seriously and are content with status quo with minor adjustments. There are bold solutions that apparently the state would help you implement if the desire was there. I would hope that there is a phase two of writing county regulations to achieve better air quality than was in this General Plan.

I15-10

Sincerely,

Connie Fry

As an interested citizen, I have reviewed most of the General Plan. That doesn't mean I have read all of it! I would say the most important parts addressed are concerning air quality, land use (development), and transportation (vehicles), which are inter-related.

After the first draft of the General Plan was made public in 2008, a letter from Deputy Attorney General Susan Fiering gave a scathing rebuke, listing all the reasons the county had to get serious about greenhouse gases. She was concerned that county emissions of CO2 are expected to increase by 1.7 tons and considers air quality the most important, with vehicular traffic the main factor. She wrote that greenhouse gases affect us by more fires, and increase in health problems and deaths, more dairy cattle dying from heat as temperatures increase, climate change affecting crops such as stone fruit, etc. She writes that the plan leaves land uses and growth to allow market forces to decide and that it considers a narrow range of alternatives, ignoring "smart growth." "Significant but unavoidable" is not satisfactory. She states that no alternatives or enforceable restrictions are given for building projects or land use, but that the state can help the county with needed changes.

A large criticism of the plan is that it is vague, without specifics, measurements, regulations, monitoring or enforcement and "no mitigation measures are available" for change. It seems not much has changed since 2008 in the updated version. For instance, in the air quality section:

P. AQ1-3 "The county shall require development to be located, designed and constructed in such a manner that would minimize cumulative air quality impacts. Applicants (for development) are to propose alternatives to reduce air emissions."

Is the county setting standards for approval that are specific, and if possible, measured from a present baseline? What changes are they to make? Are they deciding or are you? What about enforcement of smart growth principles for smaller lots, development in such a manner to be close to shopping, parks, etc.? We are talking about the 25% asthma rate of children living here. Every time you see a toddler, you have to consider their future health.

Consider how weak your plans are:

P. AQ 1-12 "The county shall encourage LEED (leadership in energy and environmental design) and ND (neighborhood development) certification for new development to promote energy conservation and sustainability."

P. AQ 3.4 "The county shall encourage ecologically based landscape principles that can improve air quality improving CO2."

P. AQ 3-5 "The county shall encourage all new development including rehabilitation, renovation, and redevelopment to incorporate energy conservation and green building practices to the maximum extent feasible."

P. AQ 4.1 "The county shall support air quality attainment plans. Measures will be applied to new development approvals and permits as appropriate."

Encourage, support, propose alternatives as appropriate – how concrete and regulatory is that? Will anything really change in our air quality? No wonder the Deputy Attorney General calls the county building plans "market driven." In other words, where is any incentive for developers to go much beyond the status quo, or just enough to get by?

Besides air quality issues, the other alarming part of the General Plan concerns land use planning. The one most affecting our area is to take place in "Cotton King" Boswell's Yokohl Valley development at

the eastern base of Badger Hill, extending north to Highway 198 and south to the entrance of the scenic highway to Springville. It is projected to be a planned community of 34,000 inhabitants, with some lots of 1.3 acres, not exactly smart growth. However, the plans shown to the public when the EIR began, showed no shopping or employment opportunities. It would be a bedroom community. The air emissions from driving for most services would back up against the hills to collect and stagnate. Were you aware that is already the case in Three Rivers in the fall until the rainy season? Take a plane ride up the canyon and see for yourself.

The other new Urban Development Boundaries where 25% of the growth will take place will also cause more traffic. This would seem to contradict the county "Alternatives to the Proposed Project" (EIR 4-2). "Significant environmental impacts that the county seeks to eliminate or reduce are:

- Air quality impacts from increased development and vehicular traffic

- Loss of Agricultural land

- Biological resource impacts resulting from loss of habitat

- Viewshed impacts resulting from increased development

- Groundwater impacts and availability of adequate water supply resulting from increased development

How would air pollution be reduced if all these new urban townspeople drove to major areas for medical services, auto services, hospitals, cultural events, etc.? Will the new areas be self-contained and businesses be encouraged to meet the needs of the public so there is less driving?

I will say the General Plan is a huge effort to compile. Small comments (only suggestions, not regulations) such as ATMs and vending machines at large employee sites, staggering work hrs., carpooling, studying traffic patterns of intersections of high emissions, paving dirt roads, paving or stabilizing shoulders of roads, etc. may help, but are not enough, and not nearly as significant as regulations of new development.

Several subjects seemed to be left out, for instance the impact of agriculture, which comprises 23% of our economy, according to the Tulare County Economic Development Department. You do not address the dust of tree shaking during the nut harvest. You do not address the problem of dairies which by your statistics in your inventory in Appendix E, figure 1, measure greenhouse gases as comprising 63% of the county's greenhouse gases. Any equipment with engines such as agricultural also contributes to air pollution, as well as motorboats on Lake Kaweah. How are they regulated?

I am upset about land taken out of cultivation for small parcels for homeowners who decide they want to live in the country, known as ranchettes. This is not recognized for what it is, rural sprawl. As they are allowed to locate closer to towns, they contribute to cities growing together such as Exeter and Farmersville. Also, as you allow county land to be annexed to enlarge city boundaries for developers, it gives opportunity to hopscotch over agricultural land instead of infill. City growth needs to be planned growth, not beholden to developers' voracious appetite for profit. County planning, or lack of it, is as much responsible for this as city planning commissions. City planning commissions are not always wise and thinking for future good, such as smart growth and saving ag land for the future food production of our nation.

Decisions made now are not just for tomorrow. They are for always. With such feeble attempts at reigning in air pollution with an attitude of "significant but unavoidable," with more cars on the road as each year comes, I see little hope for our county and the health of our residents. It doesn't seem like your plans take air quality seriously and are content with status quo with minor adjustments. There are bold solutions that apparently the state would help you implement if the desire was there. I would hope that there is a phase two of writing county regulations to achieve better air quality than was in this General Plan.

Sincerely,

Connie Fry

RE: Comments on the Recirculated Draft Environmental Impact Report (RDEIR) for the Tulare County General Plan 2030 Update

Dear Mr. Bryant:

The following are my observations, most of which don't seem to have been raised by other commentators on either of the drafts of the subject EIR. Thank you for your complicity in this artificial disaster that will visit calamity on your grandchildren who will be stranded in a hellish world without transportation and wondering why their elders would act so irresponsibly.

I16-1

#### POPULATION PROJECTIONS

I16-2

Estimates of the scale of a project must be made competently and transparently. RDEIR Chap. 7, p. 7-1, provides a source of historical population:

"Tulare County Association of Governments (TCAG). 2008. Table 2: Historical City/County Population Estimates, 1991-2007, with 1990 and 2000 Census Counts. Data provided by Mark Hays, TCAG Associate Regional Planner."

However, the documentation necessary to verify the numerical conclusions stated in the RDEIR are neither published in the RDEIR nor made available to the public as required by CEQA. My attempts were unsuccessful in obtaining the information as evidenced by the unanswered E-mail message below:

mahays@co.tulare.ca.us

sent 3:09 pm 20100519

Population Projection source data for GPU EIR

Mr. Hays:

I called last week for the subject information. I left a message that was followed up by Marvin Demmers. He said he would get back to me after doing some checking. I have not yet heard from

him or received the requested information. It would be helpful if this information is made available as soon as possible so that I can determine whether or not RMA should be made aware of any possible discrepancies with respect to its use of its projected growth projection figure by the public comment deadline.

I16-2  
cont'd

--Don Manro  
686-6836

RDEIR Chap. 1, p. 1-13, identifies 2 documents only that are incorporated by reference--a background report dated 2008 & the Goals & Policies Report. No document is identified for population projections.

I16-3

RDEIR Chap. 2, p.2-24, identifies TCAG for population projections, but not a document for the source data. However, a page number and a date is given:

I16-4

"The proposed project is based on a projected year 2030 population of 742, 970. This population estimate is based on projections provided by TCAG (TCAG, page 1, 2008) and the State Department of Finance (California Department of Finance, pages 18-19, 2007)."

The same page goes on describing what was done with the projections as well as providing references some early documents & processes presumably for mapping and modeling.

Lacking the source document that is referenced in the RDEIR but which is unavailable, and the failure to describe the method of projecting the future new growth estimated at 742,970 (page 2-24) for the year 2030, the decision-makers and public are being uninformed as to the comparative value of the annual incremental future growth with that of any past time period.

The table on the following page was constructed to obtain, by trial and error, an estimate of the average annual increase in population required to match the RDEIR's total new growth of 742,900 (page 5-2), starting with year 2007 and ending in the year 2030. The resulting rate is 2.31431%. This is roughly equivalent to but 5% larger than the 2.2% estimate in the RDEIR for the period 2000 to 2007. There is no information provided to indicate whether or not either of those rates are typical in the larger historical context, or what new trends might justify such a high rate except for the implied laissez-faire approach to new development that the GPU represents. Note that the table below extends the calculation beyond the 2030 population depicted in RDEIR Table 5-1 to illustrate that this rate would result in a county population of one million by 2043. The 2007 population would double early in 2036 (26 years from now).

I16-5

## DIRECT IMPACTS

The direct impacts that are considered significant and unavoidable will be worse due to the new policy promoting the creation of new cities. Therefore, the statement on RDEIR page 5-3 that fails to include the bureaucratic euphemism "Planned Community Area" (PCA) among the loca-

I16-5  
cont'd

tions where new growth will be directed--also characterizing the GPU's intended attributes as benign--is wildly misleading. Perhaps the failure to designate any such locations on the LU Diagram is supposed to excuse such unjustified optimism. That oversight may also be intended to erroneously relegate some of the most egregious impacts of the "whole project" to the rubric of cumulative effects.

I16-6  
cont'd

## INDIRECT IMPACTS

I16-7

The explanation of the significant indirect effects on p. 5-3 contains further misleading statements concerning where growth will take place as if there was no new policy allowing the creation of new urban centers:

"specific policies. . . focus new residential growth within existing areas that currently provide a mixture of housing, shopping and employment opportunities . . ." (Emphasis added.)

## GROWTH INDUCING EFFECTS

I16-8

The growth inducing impacts that are considered significant and unavoidable will also be more severe than stated due to the new cities policy. The statement on page 5-3, which claims the intent to ". . . provide a framework in which the growth can be managed in order to best suit the needs of the County and its various community plan areas . . ." will actually compound the current sprawl producing practices by setting aside additional rural areas for urban development to be approved by the county. It is not the legislative intent of CEQA to be a vehicle in which local agencies catapult propaganda that conceals their intent to appease the growth-related industries and garner short-term revenues at the cost of eventual environmental collapse.

## CUMULATIVE IMPACTS

I16-9

Since it is doubtful that a single certified document containing regional or areawide conditions exists to utilize for evaluating the 2030 GPU's contribution to cumulative effects, the county employed a hodgepodge of specific project informational documents whose certifications cannot be verified by the public because of their unavailability. The method actually used is more like a list. However, the projected growth within and adjacent to the Tulare County cities it lists constitutes the larger part of the project-specific impacts attributable to the GPU, and therefore, their impacts cannot be divorced from the GPU, placed in a group of other projects causing related impacts, and used to distort the discussion of cumulative effects.

The cumulative list should be revised to delete all the projects lying within Tulare County which should be depicted on the LU Diagram because they are integral components of the project area subject to the GPU program and will directly produce the project's incremental effect on the environment.

“As defined in Section 15355, a cumulative impact consists of an impact which is created as a result of the combination of the project evaluated in the EIR together with other projects causing related impacts.” (Guidelines, sec. 15130 subd. (a)(1).)

I16-10

The growth related impacts occurring within the project boundaries must be considered together as producing the project’s incremental effect in order to avoid understating the severity of its incremental effect when making a determination as to whether it is cumulatively considerable. It would be illogical and confusing to do otherwise. So, the following questions must be asked:

Are the population projections contained in the listed documents counted both as project-specific growth *and* as growth attributed to other projects, or were they counted only once? If just once, then which choice--the project described by the GPU or those projects erroneously considered among those treated as “regional growth projections” in Table 5-2? Please provide the reasoning behind the choice when responding.

The peril of approving projects without adequate analyses of cumulative impacts takes the abuses of piecemeal review to a higher order of magnitude. (*Las Virgenes Homeowners Federation, Inc. v. County of Los Angeles* (1986) 177 Cal.App.3d 300, 306.)

I16-11

The RDEIR's stated method of discussing cumulative effects is inadequate. CEQA requirements for what constitutes a valid planning document for utilizing a summary of projections is as follows:

“A summary of projections contained in an adopted general plan or related planning document, or in a prior environmental document which has been adopted or certified, which described or evaluated regional or areawide conditions contributing to the cumulative impact. Any such planning document shall be referenced and made available to the public at a location specified by the lead agency.” (Guidelines sec. 15130, subd. (b)(1)(B).)

Tulare County not only fails to utilize a single (one) planning document for this purpose, but contrary to the CEQA requirements, its reams of referenced document(s) that supposedly contain growth projection summaries have not been made available to the public at a specified location by the lead agency. Given that fact, neither the decision-making body nor the public can verify which planning documents have actually been adopted and/or certified as required, whether they are up to date, or whether they evaluate regional or areawide conditions.

I16-12

The only such document listed in RDEIR Table 5-2, page 5-5 with which I am familiar--the GPU for the City of Tulare which, incidentally, was prepared by the same consultants that the county hired--was decertified subsequent to the granting of a writ of mandamus on April 30, 2009. (*Manro v. City of Tulare* [Tulare Co. Sup. Ct. Case No. 08-228094]; *Sierra Club v. City of Tulare* [Tulare Co. Sup. Ct. Case No. 08-228122].) The approvals were rescinded via Resolution No. 09-76, dated July 21, 2009. Since this invalidated document appears to have been utilized in the cumulative effects discussion in the RDEIR, the information utilized in the summary of projec-

I16-13

tions is not authorized. The only authoritative information would have to be supplied by an outdated document--The City of Tulare 2005 General Plan Update--whose EIR was certified 17 1/2 years ago in December 1992.

I16-13  
cont'd

An EIR should provide a reasonable explanation supporting the geographic area used in the analysis in addition to defining it. (*Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 721: Guidelines, sec. 15130, subd. (b)(3).)

I16-14

A list or summary of projections should include projects within the region affected for common resources like valley floor agricultural soils, projects depending on the same water sources, state and federal transportation systems, the region bounded by geographic barriers to ambient air circulation, the portion of the scenic highway system in view of the Sierra Nevada, etc. While RDEIR page 5-4 suggests an approach for defining geographic limits to the discussion of various impacts, the actual discussion of each impact is void of such definitions.

Since most of the impact areas discussed in the RDEIR fail to specify the geographic limits, it is impossible to verify whether the ones employed are reasonable. And due to the fact that the documents cited in the RDEIR for basing its projections of cumulative impacts are so limited geographically, their discussion could not and does not reflect their severity.

"The discussion of cumulative impacts shall reflect the severity of the impacts and their likelihood of occurrence . . . ." (CEQA Guidelines, sec. 15130, subd. (b).)

For example, there is no indication of what geographic area is being covered in the aggregate of planning documents used to project how much farmland of various types or how much acreage under Williamson Act contracts will be affected in a reasonably defined agricultural region within which Tulare County growers and ranchers participate. In fact there *are* no projections.

There are 8 counties in the SJVAPCD, but the projections on air quality effects supposedly takes only the southern 4 into account (including Tulare County). No explanation provided.

While the record in *Kings County* contained no definitive answer to the question of whether the analysis understated the severity and significance of the cumulative air impacts, the court concluded that the omission of information rendered the EIR inadequate. The reason given is that by merely excluding such information, the burden of providing it would be unfairly placed on the public. (*Kings County, supra*, 221 Cal.App.3d at p. 724.)

The growth projections should be consistent throughout the RDEIR. Why is the distribution of population given as 85% cities and 15% unincorporated on page 5-4?

I16-15

Yours truly,  Don Manro

RE: Revised Tulare County Draft General Plan 2030 Update and Recirculated Draft Environmental Impact Report (SCH No. 2006041162)

Dear Mr. Bryant:

Please find enclosed our comments on the revised draft General Plan 2030 Update (GPU) and its RDEIR. We appreciate the tremendous effort that the County has put into preparing these documents, and the opportunity to comment on them. | I17-1

Unfortunately, we have found the draft GPU/RDEIR to be inconsistent, incomplete, contradictory, vague, and weak. It does not provide a comprehensive, cogent, relevant view of the County's current conditions, nor does it adequately address the project's effects on the County's citizens' priorities of cleaner air, reliable water, protection of our agricultural and open space lands, a more diverse economy, and efficient growth centered on our existing communities. | I17-2

The DEIR does not present a reasonable range of alternatives including one that is focused on achieving these priorities while avoiding or effectively mitigating its impacts, and the project's policies and implementation measures are far too vague and weak to accomplish them and the mitigation and implementation required by CEQA. | I17-3

The draft documents do not provide an adequate baseline, do not adequately disclose significant adverse environmental impacts, do not adequately identify meaningful alternatives and mitigation measures, do not adequately address cumulative impacts and measures to avoid or mitigate them, do not adequately address the project's impacts on global climate change (nor the impacts of climate change on the project), and do not adequately address measures to avoid or mitigate GHG emissions. | I17-4

The updated draft GPU/RDEIR still requires extensive revision and its Alternatives must be revised to include one that is clearly environmentally superior and that focuses on accomplishing the expressed priorities of Tulare County's citizens by firmly directing resource-efficient growth into existing urbanized areas and by defining and clearly implementing a strong mitigation program for unavoidable impacts. That Alternative will do the most to fulfill the General Plan's goals and values while meeting the requirements of CEQA. | I17-5

We are including our comments from 2008, which are incorporated by reference as well in our May 27, 2010, comments. Far too many of them were not addressed in the revised and recirculated GPU documents. Please note that our May 27, 2010, comments override any inconsistencies in this attachment. Thank you for considering our comments. | I17-6

Sincerely,

Greg and Laurie Schwaller  
43857 South Fork Drive  
Three Rivers, CA 93271  
559-561-0111; lschwallerl@wildblue.net

Thank you for the opportunity to comment on these documents – the revised draft General Plan Update (GPU - including the Goals and Policies Report [GPR] and the Part III plans for communities, hamlets, FGMP, etc.), the Background Report (BR), the Recirculated Draft Environmental Impact Report (RDEIR, which includes the Background Report as Appendix B and the General Plan 2030 Update as Appendix C). Since the Climate Action Plan (CAP), which is described as an implementation measure to the General Plan 2030 Update, is not going to be adopted concurrently with the GPU/RDEIR, we will submit detailed comments on the CAP at the appropriate time.

I17-7

**These comments incorporate by reference our comments submitted 04/14/08 on the previous draft (issued in January, 2008) of the Tulare County GPU/DEIR.** The intent is that the comments submitted on 04/14/08 at the close of the previous public comment period will be considered and responded to as part of the FEIR to be considered by the Planning Commission and Board of Supervisors after the close of the current public comment period on 05/27/10. Those comments are also a part of the administrative record. This May 27, 2010, comment letter overrides any inconsistencies in our April 14, 2008 comment letter.

I17-8

## OVERVIEW:

County staff and consultants have produced a more graphics-intensive version of the GPU/RDEIR documents issued 03/25/10, providing more maps and figures, which are helpful in some cases. The County has also included a whole new document, its **Climate Action Plan (CAP)**. Bewilderingly, the County states that this critical document will serve as an implementation measure to the General Plan, but also states that it is not a part of the formal General Plan Update documents and will not be considered for approval at the time of the GPU adoption. **Please explain the logic of this, and how the impacts of the proposed project can be evaluated if a significant implementation measure is uncertain of adoption.**

I17-9

Despite the cosmetic improvements and the creation of the CAP (which relies on policies and implementation measures in the GPR for its effect), the 03/25/10 version of the GPU/RDEIR **continues to fail to effectively, robustly, and substantively address the key issues identified by the County's citizens in the GPU workshops conducted to obtain this information.** These issues were listed in the 2008 GPR (p. 1-6): air quality, water quality and availability, continued conversion of agricultural land to residential development, and the need to diversify the economic base (to provide for higher paying year-round employment). **This information has been deleted in the 03/25/10 GPR, along with any reference to the Technical Advisory Committee. This information should be restored to the GPR, and the people's priorities should be a major focus of the GPU, informing all of its Elements, Goals, Policies, and Implementation Measures.**

I17-10

County residents said they wanted new growth focused in **existing** urbanized areas, instead, the current version is emphasizing ever more strongly a very different vision, focusing on promoting New Towns (renamed as "self-

I17-11

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

1

sustaining communities”) and the creation of development corridors along all the County’s major regional transportation arterials and major transportation routes within urban boundaries, such as Mooney Boulevard. **Not only are these New Towns and sprawl corridor development plans contrary to the will of the people, they are directly contradictory to achieving the goals of the State of California to reduce greenhouse gas emissions in an effort to stave off the worst impacts of global climate change.**

I17-11  
cont'd

Tulare County has been in the national and international news in the last few months, with Visalia cited as #3 in the EPA’s list of the top five cities with the highest ozone concentrations in the nation (with LA #1, Bakersfield #2, and Fresno #4) in “Time” magazine and an article in the “Economist” describing the San Joaquin Valley as worse than Appalachia. **The County’s General Plan Update should be making a major effort to ensure compact, efficient, economical, transit-friendly, walkable, water-sensitive, livable development that puts people where jobs, infrastructure, and services already exist and revitalizes communities with the opportunity to diversify their economies.** Such a plan for responsible growth would also help to preserve agricultural and open space lands and scenic landscapes and habitat, allow for more groundwater recharge opportunities and better runoff and stormwater management, reduce greenhouse gas emissions, reduce costs to taxpayers, promote a sustainable tourism industry, attract clean industry and businesses, help to reduce air pollution, and improve quality of life.

I17-12

I17-13

The County is facing an emergency in water supply and quality; its poor air quality costs it dearly in lost productivity, missed school days, emergency room visits and long-term health care, human misery, and truncated lives; and it will suffer disproportionately from the impacts of accelerating global warming. Its population is growing rapidly, with a high birth rate and a very high rate of teen pregnancy. To provide for its burgeoning population, Tulare County is proposing diesel spewing Freight Villages (GPU GPR page 13-3, TC-1.7), highway sprawl development corridors, and New Towns designed not to provide the affordable housing that our residents need close to jobs and services, but to attract additional people to an already overburdened county.

I17-14

I17-15

**THE DRAFT GENERAL PLAN 2030 UPDATE DOCUMENTS MUST BE REVISED TO ADEQUATELY INVENTORY AND ANALYZE BASELINE CONDITIONS AND IMPACTS AND TO ADEQUATELY DESCRIBE THE IMPACTS OF THE PROPOSED PROJECT:**

I17-16

The Value Statements, Framework Concepts, and Guiding Principles of the Goals and Policies Report are generally reflective of the expressed wishes of the County’s citizens, but need to maintain focus on air quality, water, agricultural and open space lands, and a more diverse economy. Despite hundreds of pages of comments received on the original draft Goals and Policies and on the NOP for the DEIR, and over 1,000 pages of comments received on the January 2008 version, and regardless of the professional, scientific, legislative, and legal findings available to guide it, **the County is still failing to adequately inventory and analyze current (baseline) conditions (in the Background Report), to adequately inventory and analyze the environmental impacts associated with the draft General Plan’s implementation (in the RDEIR), and to write policies and implementation measures**

2

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

adequate to effectively address the adverse effects of current conditions and those adverse conditions that will be created or exacerbated by implementation of the proposed General Plan Update (in the GPR and GPU Part III plans).

I17-16  
cont'd

The Plan's component documents present a great deal of information, but too often ignore or assume solutions to problems without presenting the public and decision makers with sufficient facts and clear analysis to confidently determine that the necessary relevant issues and their impacts have been fully and accurately described and that the policies and implementation measures provided to remedy these adverse conditions will be sufficiently comprehensive, clear, firm, measurable, enforceable, and funded to do so.

I17-17

The Background Report, which is to provide the environmental setting, in numerous instances does not provide sufficient information to establish a clear baseline and inventory of existing conditions and their impacts, nor does it sufficiently explain the sources used and the basis for selection of the information presented; in some instances it seems even to be deliberately misleading. It tends to provide lists of definitions (which too often do not provide the information that would make them meaningful to the reader and relate them to the purpose of the GPU). For example, Section 1.5 "Organization and Purpose of the Background Report" (BR p. 1-4 ff) begins by stating that "This report is organized into twelve chapters, as follows." It then lists the Chapters and outlines the topics discussed under each. Then it ends. As is all too typical, it provides a list, but it never gets in to the Purpose of the information listed. It fails to adequately provide the environmental setting because it does not relate its lists of facts to Tulare County's environment, and thus does not enable the reader to see their significance.

I17-18

For another example, Table 6-2, on p. 6-15 of the Background Report contains information from the CARB website. This information should be presented exactly as it is shown on the CARB website and then should be explained in accompanying text so that the reader can understand which figures are significant and why.

I17-19

The Table is misleading because it does not describe and clarify the basis for the information it presents. For example, on the CARB website, PM10 information is reported two ways, as an actual measurement, and as an estimated measurement. The PM10 monitoring station samples the air typically only about every 6 days and then records the PM10 for each of those days. This measurement provides the actual PM10 level on about 60 specific days out of the year, which the CARB reports as the Number of Days Above the Standard. The CARB also prepares an estimate of the number of days PM10 levels would exceed the standard within a year by compiling the 60 specific days' measured information and projecting it through the 365 days of that year; CARB reports this as the Estimated Days Above Standard. The Estimated Days Report's figures give a more meaningful idea of the actual PM10 impact, because most of us are breathing the air every day, not just on the approximately 60 days of actual measurement. Here's the difference, for instance, looking at the data from the Visalia Monitoring Station

3

for 1996-2003. The first figure shows the number of days out of the approximately 60 on which measurements were actually taken that PM10 exceeded the State 24-Hour Standard; the second figure shows the estimated number of days on a yearly basis, projected from the actual days' readings, that the standard would be exceeded: 1996—25/148.2, 1997 – 11/64.6, 1998 – 18/101.8, 1999 – 30/182.1, 2000 – 30/195.6, 2001 – 27/167.9, 2002 – 29/178.8, 2003 – 17/107.9.

I17-19  
cont'd

**The Table should reproduce exactly the complete information from the CARB website, and clearly explain how to interpret the information, not edit it to create a misleading impression of the impact.**

That so many errors and inadequacies are found in a single table raises concerns regarding the accuracy and reliability of the other tables and information in the GPU documents. Numerous examples will be noted below as these comments proceed through the GPU.

As another example, Section 7.9-Schools (pp. 7-75 ff) of the Background Report “describes the general characteristics of Tulare County’s school facilities.” However, wherever there is an indication of the date of the data used, it is evidently from 2002 or 2003, and thus is not current for purposes of the RDEIR. Additionally, the characteristics of the various schools (e.g., number of students and teachers, rate of growth or decline in enrollment, capacity, physical condition, new construction, etc.) are not consistently described, so that information supplied for one school district is not supplied for another (e.g., very little information is provided for Pixley, Richgrove, and Rockford) . Very importantly, it is not stated in the text which communities, hamlets, or other areas are being served by most of the listed districts (although it is obvious for some by their names). Thus, the reader cannot determine which of the projected County growth areas would affect which schools and districts, and to what degree. This section must be extensively revised to give the reader a much clearer idea of how the planning and land use decisions of the proposed project will impact the County’s schools and school districts.

I17-20

## **THE DRAFT GENERAL PLAN 2030 UPDATE DOCUMENTS MUST BE REVISED TO PROVIDE ADEQUATE POLICIES AND RELIABLE IMPLEMENTATION MEASURES:**

I17-21

The Goals and Policies Report and Area Plans are to embody the project description and environmental mitigation. Page 1-8 of the GPR (second paragraph) states that a policy is “a statement that guides a specific course of action for decision-makers to achieve a desired goal. The County has strived to develop clear *[sic]* policies (the new version omits the former “and unambiguous,” which should be restored).”

Page 1-2 of the 2008 Goals and Policies Report (GPR) stated that the GPR is the “essence” of the General Plan and that it “identifies a full set of implementation measures that will ensure the goals and policies in the General Plan will be carried out.” Page 1-9 of the GPR states that an implementation measure is “a specific measure, program, procedure, or technique that carries out plan policies” and that “Implementation measures should describe actions that are concrete and measurable so their completion can be easily monitored in annual reports.”

4

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

These definitions have been substantially weakened in the 2010 version, along with the possibility that the IMs will actually be implemented. The Implementation Measures (IMs) are now defined on page 1-11: "The Implementation Measures set forth at the end of each Element constitute a preliminary, anticipated Work Plan to assist in carrying out the Goals and Policies. An Implementation Measure is a specific action, program, procedure, or technique . . . provided to help ensure that appropriate actions are taken to implement the General Plan. . . . Implementation Measures describe actions that are measurable [no longer concrete] so their completion can be easily monitored in annual reports."

I17-21  
cont'd

**The Implementation Measures are then rendered even more inconsequential and less likely to accomplish anything:** "The following principles guide action on these Implementation Measures:

- The timelines associated with the Implementation Measures are general guidelines for completion of the Work Plan.
- Completion of various tasks in the Work Plan are subject to available staff, financial resources, and other considerations.
- Implementation can take time, especially when needed resources are limited and required for more than one Implementation Measure."
- (p. 1-12) "Because implementation will take time and will be costly, the County will need to prioritize Implementation Measures" probably as part of its annual general policy-making function and budget cycle [How will the County involve the public in this prioritizing process?]
- "While the Plan policies identify specific programs, Implementation Measures may be adjusted over time, without amending the General Plan . . . so long as they remain consistent with the intent of the General Plan and adopted mitigation measures."

How can the public rely on such measures to implement anything? To enable the public to see how the GPU will comply with CEQA, and effectively implement the policies and mitigation measures essential to compliance with AB32, SB375, and its Climate Action Plan, the County must provide IMs that are concrete, measurable, and trackable. **If it is unlikely that the County will have the time, money, staff, or other necessary resources to carry out an IM, then it is misleading to list it as such, so that the public relies on an IM to their detriment. The County should clarify what its resources and priorities are with regard to the listed IMs, many of which have been listed for several years already, with no evidence of progress having been made.**

Additionally, many of the GPU policies are far from specific, clear, and unambiguous, and many have no corresponding IMs listed. Many of the IMs that are provided are so vague as to be neither measurable nor enforceable; many state that they are "new," yet indicate for their timeline that they are "ongoing," so that one cannot determine whether they are supposedly already being implemented (in which case the date of actual implementation should be shown) or when one could expect them to be in force; others are scheduled

I17-22

to be commenced so far in the future that it is doubtful that much in the way of meaningful outcomes can be made to result from them within the life of the 2030 General Plan. | I17-22  
cont'd

For example, LU-7.13 on p. 4-32 of the GPR states as a New Policy that "The County shall encourage and support efforts by local preservation groups to identify and rehabilitate historically significant buildings." "Encourage" is not a clear, , specific course of action, as required by the definition of a policy on p. 1-8. The Implementation Measure, #23 on p. 4-36, says "The County shall cooperate with local preservation groups and community property owners who identify historic buildings . . . to encourage perpetuation of identified architectural characteristics in new proposed development . . . within the same view shed as the historic building." This is stated to be a New Program. The timeframe is shown as "Ongoing." This Implementation Measure (IM) is not "a specific measure, program, procedure, or technique," nor is it concrete or measurable, as prescribed by the definition of an implementation measure on GPR p. 1-9. How does one measure or enforce "encourage" and "cooperate?" The policy to "encourage" is to be implemented by a measure requiring the County to "cooperate" with others to "encourage." The goal behind this policy is admirable, but how will the policy or its implementation measure ensure achievement of the desirable goal? What specifically is meant by cooperate and encourage? | I17-23

Similarly, LU-7.15 (a New Policy on p. 4-32 of the GPR) states that "The County shall encourage the use of solar power and energy conservation building techniques in all new development." The Implementation Measure (#24 on p. 4-32) says "The County shall review LEED and LEED-ND certification requirements and develop an implementation program." This review is timed to start sometime between 2010-2015. Again, the policy ("encourage") is in no way a statement of a clear, unambiguous, specific course of action, and the implementation measure ("develop . . . an implementation program") is far from being a concrete, measurable, specific measure, program, procedure, or technique. Given the urgency of global warming and the need to comply with AB32, not to mention the County's severe air and water problems, and also given the abundance of jurisdictions which have already adopted and implemented LEED standards, the County must do much more than merely "encourage" use of solar power and energy conservation building techniques, and the requirement to do so should commence well before 2015. The draft GPR has included this IM since November of 2006, but apparently the County has not yet addressed reviewing and implementing LEED, | I17-24  
I17-25

Unfortunately, the examples above are typical of the GPU's policies and implementation measures: too often vague, ambiguous, ineffective, and not measurable. Thus, the policies and implementation measures all too frequently cannot be relied on to achieve the goals of the GPU (including those of the Climate Action Plan), to effect the measures listed in the RDEIR to minimize and mitigate the project's environmental impacts, nor to implement any of the RDEIR Alternatives. The policies and IMs must be clarified and strengthened in almost every case. | I17-26

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR | I17-27

**Additionally, it must be noted that the 2010 version has made substantive changes in Policies and Implementation Measures without explanation or justification in the GPU/RDEIR documents.** For example, WR-1.4 Conversion of Agricultural Water Resources (GPR p. 11-7) has been significantly reworded, and one of its key criteria has been deleted (see detailed discussion under WR-1.4 below).

I17-28

## **THE GPR MUST BE REVISED TO INDICATE POLICY CATEGORIES:**

On p. 1-8 (penultimate paragraph), the GPR states that “**Consistency determinations** are not made based upon a specific Goal but are made **based upon Policies** set out under that Goal, as provided for in the California Planning and Zoning laws.. The 2008 version of the GPR stated that the “County has strived to develop clear and unambiguous as policies [*sic*].” The 2010 version no longer includes this statement. Certainly “clear” and “unambiguous” are important policy standards, and they should be restored and adhered to.

I17-29

Page 1-13 of the GPR states that “General Plan policies fall into four categories depending on the purpose they serve and how they are implemented.” The categories are (1) **Framing Policies**, which “set out broad direction, much like a goal,” and “typically do not require a follow-up implementation measure”; (2) **Consistency Standard Policies**, which establish a basis for consistency findings in project reviews and are “**self-implementing**” and do not require follow-up implementation measures; (3) **County Directory Policies**, which commit the County to an action and **generally require a specific implementation measure**; and (4) **Environmental Mitigation Policies**, which serve to minimize or eliminate environmental impacts, often identified through the EIR process; it is **not stated whether these latter policies require implementation measures.**

I17-30

However, the policies in the GPR are not labeled to indicate which of the categories they belong in, leaving the reader to wonder whether they are supposed to not need implementation measures or are self-implementing, or do require implementation measures.

**Please label all the policies per their categories** (it would be especially helpful if Environmental Mitigation Policies were labeled as such; wouldn’t most of them need mitigation measures?).

## **THE GENERAL PLAN 2030 UPDATE DOCUMENTS MUST BE REVISED TO ADEQUATELY RESPOND TO THE PEOPLE’S PRIORITIES:**

In public workshops, hearings, and comment letters, the people of Tulare County have repeatedly expressed their priorities for the future: cleaner air, reliable availability and quality of water, growth centered on existing developed areas to minimize the conversion of natural resource lands (farmlands, ranchlands, scenic landscapes, open space, forests) to urban uses, and a more diverse economy; in other words: healthy air, healthy water, healthy land, and a healthy economy.

I17-31

<p>The GPU gives lip service to these values. Unfortunately, as will be discussed below, it <b>fails to provide the planning framework; strong mandatory policies and implementation measures; and RDEIR Alternatives that will fulfill these priorities.</b></p>	<p>I17-31 cont'd</p>
---	--------------------------

<p><b>THE RDEIR MUST BE REVISED TO PROVIDE A REASONABLE RANGE OF ALTERNATIVES, INCLUDING A REASONABLY ENVIRONMENTALLY SUPERIOR ALTERNATIVE:</b></p>	<p>I17-32</p>
---	---------------

<p>The Alternatives presented all assume the adoption of the current draft of the Goals and Policies Report, which, as discussed above, provides inadequate policies and implementation measures that cannot be relied on to effect the project Alternatives or mitigation measures.</p>	
--	--

<p>None of the Alternatives offers a clear choice and firm direction for compact, resource-efficient, healthy growth, as demanded by the County's citizens, as discussed above.</p>	<p>I17-33</p>
---	---------------

<p>No concrete, quantified, factual comparison of the relative impacts of the proposed Alternatives is made to enable the reader to confidently evaluate their actual relative effects on the environment and on achieving the project's objectives.</p>	<p>I17-34</p>
--	---------------

<p>Good maps and statistics should be provided, clearly depicting the "before" and "after" for each Alternative, so that the reader can "see" and evaluate the impacts of each Alternative and its likelihood of achieving the project's objectives.</p>	<p>I17-35</p>
--	---------------

<p>Indeed, one cannot determine from the GPU what the project objectives <u>are</u> in any concrete sense because the GPU seems never to actually plan or direct growth, or to seriously address environmental impacts, instead lackadaisically relying on the "market" to determine where growth should go and on "significant and unavoidable" to absolve it of responsibility for the outcome.</p>	<p>I17-36</p>
---	---------------

<p><b>The GPU must specifically describe and explain how and where each of the Alternatives will direct growth and show specifically the differences that each Alternative would achieve in terms of air quality, availability and quality of water supply, quantity of land developed, quantity of agricultural and open space land preserved, reduction of greenhouse gas emissions, availability of alternative transit, walkability, provision of infrastructure and services, and diversification and strengthening of the County's economy – as well as the effect of each Alternative on County compliance with AB32 and SB375.</b></p>	<p>I17-37</p>
--	---------------

<p><b>The GPU must provide a truly environmentally superior Alternative that is measurably significantly resource-efficient, demonstrably acts to reduce VMTs and GHG emissions, and concretely effects compliance with AB32 and SB375.</b></p>	<p>I17-38</p>
---	---------------

<p>This Alternative will ensure that our growth is resource-efficient and focused in our existing urbanized areas that want and can accommodate it, and it will protect and preserve the natural resources on which our economy and our well-being depend. It will be supported and effected by strong, clear, enforceable policies and implementation measures, including a tiered developer impact fee program and an effective mitigation program (with at least a 1:1 ratio), that will minimize resource consumption and pay its own way.</p>	
--	--

<p>Please SEE APPENDIX B for additional comments on the RDEIR Alternatives.</p>	
---	--

We strongly urge that the Healthy Growth Alternative recommended by Tulare County Citizens for Responsible Growth in their April, 2008, and May, 2010, comment letters be included in the RDEIR Alternatives in order to provide a true range of Alternatives and a clearly environmentally superior Alternative.

**THE GPU SHOULD ADOPT AND IMPLEMENT THE AHWAHNEE PRINCIPLES (OR BETTER):**

Most of the principles for successful healthy growth in our communities are well summarized in “**The Ahwahnee Principles**,” put forth by the Local Government Commission’s Center for Livable Communities.

**These principles (or better) should be incorporated into Tulare County’s General Plan, with appropriate policies and implementation measures to ensure that they will be adhered to and carried out in all future urban development in our county.**

**The Ahwahnee Principles should be added to the Guiding Principles Section of the General Plan Framework (GPR, page A-2), to establish the overarching direction for development in the County; thus, they can be easily referenced, and can inform all the policies and implementation measures that follow. For ready reference, we will include them as Appendix A to these comments.**

**By adopting and implementing the Ahwahnee Principles** for development, many jurisdictions have been able to create and maintain a distinct character and sense of place that attracts residents, businesses, and tourists, **improving their economy**. They have also **saved on infrastructure costs**. With the adoption of a specific plan prior to any development, the developer knows exactly what the community wants, saving time and money. The participation of citizens (including developers) from all sectors of the community in the process of developing the plan ensures that citizens will get what they want for their community and can create a sense of community and understanding among all sectors. The Ahwahnee Principles were written into a guidance document published by the **U.S. Department of Housing and Urban Development** for local officials applying for CDBG and other funds. As a nearby example, **the City of Reedley** adopted the Ahwahnee Principles and also the Fresno County Growth Alternatives Alliance’s “Landscape of Choice” and implemented them in the City’s Specific Plan.

**The GPU’s draft Goals and Policies Report (GPR)** includes approximations of several of the Ahwahnee Principles in various goals and policies, but they are not yet made sufficiently comprehensive, concrete, and enforceable.

**THE MAPS IN THE GPU DOCUMENTS ARE INADEQUATE AND MUST BE IMPROVED:**

Many of the maps in the GPU documents are helpful in terms of giving very broad overviews (and they now correctly label the various populated areas of the County). However, **the County should provide individual maps showing each of the various communities and other locations proposed for development under the proposed project and what type of uses are proposed for each area (each should have its own map, to provide sufficient detail). Each of these maps should include a textual profile of the area depicted, with information on the size of the area (current and proposed), the amount of land designated for each type of use (current and proposed), existing**

infrastructure and services (e.g., water supply, quality, and capacity; wastewater capacity; drainage and stormwater facilities; school, library, fire station, etc.), the population (current and proposed), RDA information, etc.

I17-43  
cont'd

**Additionally, the County should provide individual overview maps depicting the different development patterns that would result from each of the proposed Alternatives, so that the reader could see and compare the different outcomes.** The General Plan maps (along with its policies and diagrams) form the basis for the County's zoning, subdivision, and public works actions (GPR, p. 1-2, first paragraph), so it is very important that the GPU's maps give a clear idea of the intended outcomes of the project.

**The General Plan 2030 update includes new wording that significantly tips its balance toward more development in more areas with fewer restrictions and less public input; there is no corresponding increase in wording to correspondingly improve and rapidly implement requirements for responsible development, preservation of agricultural and open space lands and community identity, developer impact fees, better air quality and assurance of water supply, and a healthier economy.**

I17-44

This problem is discussed in more detail in various sections below. **The County must re-balance the GPU's design for growth to provide for sustainability, compliance with AB32 and SB375, the effectiveness of its Climate Action Plan, and a clear focus on addressing its residents' priorities.**

## ORGANIZATION OF SPECIFIC COMMENTS:

I17-45

We will continue our comments by following the organization of the GPU Goals and Policies Report, bringing in additional comments on the RDEIR, the Background Report, and the Climate Action Plan. We will often use the term "community" to refer generically to any existing city, community, hamlet, mountain service center, or similar urban or urbanizing entity that has a defined development boundary and infrastructure that can accommodate development. Where text is italicized in these comments, the emphasis has been added by us to facilitate understanding of the comments by highlighting changes in the GPU documents.**PART I – GOALS & POLICIES REPORT**

### 1.2 Tulare County General Plan: The Structure

I17-46

**General Plan 2030 Update Overview (p. 1-2):** The first paragraph states that in 2010 a variety of important new goals and policies were added to existing components of the General Plan, some obsolete policies were deleted, and many of the obsolete policies were replaced by new provisions. **The County should provide a table summarizing these changes to assist the reader with an overview of what has changed. It should be noted here that page 1-7 has a list of Updated or Deleted Sections and Elements. That list should explain why the deleted portions (such as the Civic Center Master Plan and Library Master Plan) were deleted, The reader should also be referred to Table 1.1 on page 1-12, which relates the GP to the State Mandated Elements.**

The last paragraph on p. 1-2 says that the new or revised elements were adopted in 2010. **Which are these new or revised elements?** The first paragraph on p. 1-3 states that the Housing Element, Flood Control Master Plan, and ACFP-Phase 1 were not revised or readopted as part of the Update but are included in Part I. (However, these documents are included only by reference.) The first paragraph on p. 1-4 states that Part II includes a new Corridor Framework Plan (adopted 2010), which establishes policies that will guide the potential adoption of Corridor Plans within the County, which will be included in Part III. The next paragraph discusses existing plans that were not revised or readopted in 2010 as part of the GPU with two exceptions. The third paragraph states that the GP 2030 Update anticipates adopting additional Sub-Area Plans, County Adopted City General Plans, and Community Plans, as well as Mountain Service Center Plans, Hamlet Plans, and Corridor Plans, each of which will become components of Part III of the GP when adopted. The last paragraph on p. 1-4 describes eight existing County Adopted City General Plans, including two neighborhood plans [East Porterville and Patterson Tract, which are actually additional to the eight]. Page 1-5 says the GPR calls for adopting two additional CACGPs: Delano and Kingsburg.

I17-47

These adoption issues are very confusing. It sounds as if some parts are being adopted prior to adoption of the GPU, others are being adopted separately, and others have been adopted to guide potential adoption of further plans.

**Please briefly explain the adoption process and why so many portions are out of phase with the GPU and why it is important for the reader to understand this chronology.**

**How does the County “create” communities (p. 1-5 states that the GPR designates eight additional communities)?** The GPR “calls for” adopting a community plan for each. **What is the timeline for this process, and what guides development in the meantime?** Page 2-4 states that the Urban Boundaries Element was adopted in 1974 and that it “directed that community plans be adopted for 22 unincorporated communities to guide future development within their community boundaries.” Thirty-six years later, only 15 of the 22 communities have plans. Sultana does not appear on the list beginning on page 2-4 of the communities that will now be designated Mixed Use, but it is on the list on page 1-6 of communities which are “called for” plans (although Sultana does not have a UDB). **When will these communities have the opportunity to have input into their development future? And what about the 11 hamlets, for which the GPR calls for adoption of Hamlet Development Plans? Not to mention the 16 Mountain Service Centers listed on page 1-6.** If it took 36 years to get 15 plans done, and there are 34 to go (not counting Corridor Plans), what are the chances that the residents of these areas will be able to determine how and where they want to grow within the horizon of the GPU? Furthermore, some communities have plans that were adopted over 20 years ago and that definitely need updating. Three Rivers, for example, where we live, has been trying for well over a decade to work with the County to get its existing plan (adopted in 1980) updated, but the County has not had the resources to get this job done. **Please explain and justify why the County is determined to direct growth into all these areas when it apparently has not had the resources for decades to even get community plans done for them. How will such development be determined to meet the needs and desires of these communities/hamlets/service centers/neighborhoods?**

I17-48

11

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

## COMPONENT A--GENERAL PLAN FRAMEWORK

The first paragraph on p. A-1 of the 2010 version of the GPR is hugely changed from the 2008 version, emphasizing a whole new direction for the GPU, which contradicts and works against the expressed vision of the County's residents. The people who live here value their rural landscapes, their agricultural and ranching heritage, the beauty of the County, and their communities. They do not want Tulare County to look like Fresno County or Orange County or Los Angeles County. A little over 50 years ago, Los Angeles was the #1 agricultural county in California. Forty years ago, Orange County was largely open lands. It remains to be seen whether Fresno County will act in time to preserve its heritage; the draft Fresno Green Development Code reflects an awakening.

117-49

But Tulare County is rewriting its GPU in the 2010 version as if it never read the over 1,000 pages of comments submitted on the 2008 draft. Page A-1 used to say: "In keeping with the Value Statements and Guiding Principles developed for the General Plan (see below), this component is designed to *focus new unincorporated growth into the County's communities and hamlets*, encouraging economic development and *protecting the County's extensive agricultural, scenic, cultural, historic, and natural resources [emphasis added]*."

117-50

The 2010 Framework takes a very different approach: "In keeping with the Value Statements and Guiding Principles developed for the General Plan (see below), this component is designed to focus new growth into the County's Urban Development Boundaries, Hamlet Development Boundaries, Mountain Service Centers, and Corridors while encouraging economic development and protecting and facilitating the development of the County's extensive agricultural, scenic, cultural, historic, and natural resources.

**When and why was the decision made to promote growth virtually anywhere in the County (this is certainly not focused growth), and to change from protecting the County's resources to facilitating their development? The County must explain and justify this radical departure from the former Framework and show how it can better achieve the people's goals and effective compliance with AB32 and SB375 (not to mention a successful Climate Action Plan). This represents a change in the scope and impacts of the proposed project that should not be made without public notice and input and that should be reflected in the content of the Background Report, the RDEIR, and the Climate Action Plan.**

### VALUE STATEMENTS (p. A-1):

As the people declared that clean air, good water, and agricultural and open space land are their top priorities; and as a healthy environment is essential to a diverse, healthy, sustainable economy and a healthy population; and as the County declared in September, 2007, that we are facing an impending water crisis; and as our air is near or at the top of the worst in the nation (and as AB32 requires that we immediately begin to address that problem); and as global warming will only worsen our air and water problems, the County should add a new Value Statement to the

117-51

effect that: “The County will protect and preserve its invaluable natural resources, including air quality, water supply and quality, soil supply and quality, biodiversity, habitat, and open space.” I17-51 cont'd

## FRAMEWORK CONCEPTS (p. A-1):

**Concept 1: Agriculture:** Again, the County has changed the wording, adding after “protected,” “and to insure that the utilization of these resources may continue to economically succeed.” I17-52

**Concept 2: Land Use:** The wording has been changed. The 2008 version cited “a number of communities and hamlets that will grow and develop,” while the 2010 version cites “a number of unincorporated communities that will grow and develop.” **What is the intent of this change? Is this narrowing the list or expanding it? What happened to the hamlets? What is the rationale for the change?** The 2008 version says that “natural resource lands (agriculture and open space) . . . will be preserved.” The 2010 version says that “natural resource lands (agriculture, mineral extraction, and open space) . . . will be preserved and permitted to expand.” Since we can’t expand open space (although we should certainly be preserving more of it) and it’s doubtful that we can expand agricultural lands (although we should certainly find ways to permanently preserve more of it as well), then this revision appears to state that the County is going to permit mineral extraction to expand. **Please clarify the intent of this revision and why the change has been made.** The next sentence has been modified by adding “unincorporated” as a modifier of “communities.” The final sentence in Concept 2 has been very much changed. In the 2008 version, it reads, “The County will also limit the conversion of agricultural and natural resource lands to urban uses.” The 2010 version reads, “The County will also utilize its goals and policies to guide the conversion of agricultural and natural resource lands to urban uses.” **The County must explain and justify this complete change of emphasis, from limiting the conversion of resource lands to urban uses to using its goals and policies to guide the conversion of resource lands to urban uses.** I17-53

**Concept 3(p. A-2)** has not been changed. I17-54

**Concept 4 (p. A-2)** has been substantially changed. The 2008 version reads, “As Tulare County develops its communities and hamlets, the County will ensure that development occurs in a manner that limits impacts to natural and cultural resources through proper site planning and design techniques. Development will be avoided in naturally and culturally sensitive areas wherever possible.” In the 2010 version, the hamlets are gone and so is the commitment to avoid development in sensitive areas. It reads, “As the County develops its unincorporated communities, the County will ensure that development occurs in a manner that limits impacts to natural and cultural resources through the implementation of its Goals and Policies and through proper site planning and design techniques.” **Please explain why the commitment to avoid development in sensitive areas has been removed.** Given the feeble nature of so many of the Policies and their related IMs, it is not a good sign that this commitment has been eliminated. I17-55

## GUIDING PRINCIPLES (p. A-2)

**Principle 1 and Principle 2** have added “their economic viability”, and “hamlets” have been deleted from Principle 2. I17-56

Principle 3 has added “through the implementation of Goals and Policies of the General Plan,” many of which, unfortunately, may not be very effective in protecting them. | 117-57

Principle 4 (p. A-2) lists areas outside of which rural residential sprawl is to be limited and now includes “city UABs, UDBs.” “Strictly limit rural residential development . . . avoid rural residential sprawl”: | 117-58

Please strengthen language to “. . . (i.e. *prohibit* rural residential sprawl).” This is a key strategy for preserving agricultural lands, working landscapes, and open space, and for meeting AB32 and SB375 requirements. It is also very important to the success of the County’s Climate Action Plan. |

1.3 Goals and Policies Report Framework (p. 1-8 ff): previous comments apply. Please see comments above (p. 4) under THE DRAFT GENERAL PLAN 2030 UPDATE DOCUMENTS MUST BE REVISED TO PROVIDE ADEQUATE POLICIES AND IMPLEMENTATION MEASURES and (p. 7) under THE GPR MUST BE REVISED TO INDICATE POLICY CATEGORIES. | 117-59

## 2. PLANNING FRAMEWORK

Urban Development Boundary (p. 2-3): The second paragraph begins, “For unincorporated communities, the UDB is . . . .” This is inconsistent with the definition of UDB on p. 3-3, which begins, “For communities, hamlets, planned communities and other unincorporated areas, the UDB is . . . .” The unincorporated communities have UDBs and the hamlets have just been given HDBs on the maps in the GP, but where on the maps are the areas designated in which planned communities may be developed? It would be best if they would be developed only within the existing boundaries. If that is not the case, and the County intends to allow New Towns to be developed, then where is the map that designates land use for New Towns? And what are the “other unincorporated areas?” Does this mean the Mountain Service Centers? They are on a map. Does this mean the Corridors? Where is the map that shows the UDBs for the Corridors? How can the public visualize the areas that the County is proposing for development without good maps in the GP? All the proposed UDBs for buildout of the proposed GP project must be designated on maps included in the GPU documents. This will also help to indicate the environmental impact of the project. | 117-60

PF-1 (p. 2-7) “To provide a planning framework that promotes the viability of communities . . . while protecting the . . . natural resources heritage of the County.”: To achieve the goal of PF-1 and to make meaningful Policies PF-1.1 and PF-1.2, the GPR must include stringent measures to PROHIBIT leapfrog development and to REQUIRE new development (residential, commercial, and industrial) to occur ONLY within existing UDBs and HDBs where infrastructure is available and growth is desired by the community, to adhere to the Ahwahnee Principles, to be highly resource-efficient, and to pay its own way. This is our best, and possibly only, hope of achieving the goals of growth directed to existing communities, healthier air, water, land, and economy prioritized by the people of Tulare County. | 117-61

**PF-1.1 (p. 2-7):** The county has added “or foothill region,” signaling its intention to promote development in the fragile foothill environment. | I17-62

**PF-1.2, #1 (p. 2-7):** In the 2010 version, the County has removed all of the criteria for considering proposals within UABs or UDBs of the cities. The County must explain and justify why it no longer requires that the adjacent city does not consent to annex the property for development, that the County has determined that development of the site does not constitute leapfrog or noncontiguous development, or that the proposal must demonstrate regional special significance. The lack of any criteria constitutes carte blanche for growth-inducing sprawl and vitiates Policy PF-1.1 (Maintain Urban Edges). . Development should occur in an orderly, concentric, compact, efficient manner in the UDBs, in order to maintain urban edges, maintain buffers that continue community identity, provide open space for habitat, recreation, stormwater management, groundwater recharge, and carbon sequestration, and preserve the County’s rural heritage. The criteria in the 2008 version should be restored to PF-1.2 #1, with the exception of #4 under iii (“Any other relevant factor considered on a case-by-case basis”), which should continue to be deleted. **Additionally, to qualify as “regionally significant,” under a.iii, a proposal should have to meet all of the first three factors** (i.e., innovative land use planning and design principles in addition to those in this plan, significant habitat or agricultural resources will be addressed through on-site preservation or through the acquisition of off-site resources and/or fees in lieu thereof, and substantial financial benefits will be conferred on countywide operations), not just “any” of the factors. | I17-63

**PF-1.2 #2 (p. 2-7):** Significantly, “planned community areas” have been added to this list. We know where the other locations on the list (UDBs of adjacent cities in other counties, unincorporated communities, and HDBs of hamlets) are located, but where are the planned community areas? The GPU nowhere discusses this, except to state that these communities must comprise a minimum of 200 acres. **In order to be consistent with its other goals and policies, and to make an honest effort to comply with AB32 and SB375, and to have any hope of an effective Climate Action Plan, the County must restrict “planned community areas” (New Towns, self-sustaining communities) to development strictly within the tens of thousands of acres it has already earmarked for development within UDBs, HDBs, foothill development corridors set forth in the FGMP, etc.** | I17-64

**PF 1.3:** Please change to: “The County shall *require* those types of . . . .” “Requiring” could produce the intended consequence of limiting sprawl, which we have already had far too much of. **Please provide a concrete Implementation Measure for this Policy. The text should also include an example or two (“such as . . .”) in order to clarify this policy.** | I17-65

**Implementation Measure (IM) #1 (p. 2-71):** The County should require itself to do what it’s encouraging the cities to do: “require buffering measures when urban development is proposed [e.g., within community UDBs, hamlet HDBs, planned community areas, mountain service centers, etc.] when urban development is proposed adjacent to existing developed rural-residential areas.” | I17-66

**IM #2 (p. 2-71):** “A proposal submitted under PF-1.2 . . . should be subject to . . . review . . . the County should solicit . . . input . . . should consider . . . local interests.” : **Please change the 2 “shoulds” to *shall*s;** environmental and fiscal review, input of affected public entities, and balancing countywide and local interests must be mandatory, not discretionary. **Additionally, please restore the language deleted in the 2010 version: The County shall consider and balance countywide and local interests.**

I17-67

**PF 1.4 (p. 2-7):** “The County shall *require* residential growth to locate . . . .” Same reasons still, substantially strengthened by AB 32 requirements, SB375 requirements, and an effective CAP. Extending and expanding infrastructure is generally growth-inducing. The County must efficiently and compactly develop wherever possible utilizing existing infrastructure and services. Developer fees should upgrade existing infrastructure and services as appropriate. **Thank you for at last including water supply requirements; it should be emphasized that there is NO minimum threshold for these requirements: ALL development applications must meet the requirements. Please include an IM for this Policy to clarify when it will be effective and to define the terms.**

I17-68

**PF-1.6 (p. 2-8):** The County has added CACGPs, Planned Communities, and Corridor Areas to this Policy. **What are the appropriate levels of urbanized development in these new designations? This Policy should be revised to state that in ALL new development and redevelopment, the County shall require more compact, efficient, walkable, design in order to improve the health, economy, and sustainability of its development and to comply with AB32, SB375, and its Climate Action Plan.**

I17-69

**PF-1.9 (p. 2-5) “Capacity Building and Self Governance”:** Following the Ahwahnee Principles and common sense and good policy, it is essential that the County ensure the involvement of residents in self-governance. **Please change to: “The County shall *ensure that opportunities are available for the residents . . . .*”**

I17-70

**IM #3 (p. 2-71) “The County shall investigate techniques . . . .”:** Please strengthen the implementation measure for PF-1.9; simply investigating techniques will not ensure involvement. Note that this is a Policy to “encourage” with an IM to “investigate techniques” – not specific or measurable! **Please change to: “The County shall investigate *and implement* techniques to provide for enhanced local input . . . .”** Surely, techniques for involving communities are well known already. Three Rivers found the community visioning process to be very useful; we achieved excellent participation. The City of Reedley (see General Comments above) outlines a plan used to good effect in their community. **Please implement as a key technique to ensure involvement: “The County shall hold as many meetings as possible in the evening so that working people may attend, and shall provide notice of these meetings in Spanish when the affected community’s adults speak predominantly Spanish.”** No flexibility is needed for this technique. It must be noted that local advisory boards cannot develop and maintain community and hamlet plans acceptable to the County without County staff committed to carrying the community through the

I17-71

process. For well over a decade, the community of Three Rivers has tried to update its 1980 community plan, but the County has never been able to commit staff for long enough to make significant progress on the update. Presumably, this experience is typical of the other communities (many of which don't even have a plan yet, not to mention the hamlets, none of which have plans). **The County must truly prioritize and sustain this effort if it means to involve residents in self governance as it pushes more growth into their areas.**

I17-71  
cont'd

**PF-1.11 (p. 2-8):** This is a new Policy. What are the “standardized rules for reviewing and adopting boundaries” and where do they come from? Will there be any public input into these rules? There is no IM for this Policy. When will it become effective? **The County should clarify this Policy and provide all communities to be affected by it with the rules information and an opportunity for input.**

I17-72

**MAPS, Figure 2.2-1 – Figure 2.2-22, (pp. 2-13 – 2-34):** These maps should include what type of uses are proposed for each community, and each map should include a textual profile of the area depicted, with information on the size of the area (current and proposed), the amount of land designated for each type of use (current and proposed), existing infrastructure and services (e.g., water supply, quality, and capacity; wastewater capacity; drainage and stormwater facilities; school, library, fire station, etc.), the population (current and proposed), RDA information, etc. The present maps show lots of empty space, but give no real idea of present uses and densities, current capability to support and serve additional development, and proposed project buildout configuration.

I17-73

**NOTE:** In the 2008 version, Figure 2.2-11 is the Patterson Tract Urban Development Boundary. **In the 2010 version, no map for Patterson Tract appears in this section of maps. Why?**

I17-74

**PF 2.2 (p. 2-9) “Modification of Community UDB”:** These boundaries are rendered meaningless and cannot function to limit urban development nor to provide an outstanding quality of life because **the policies make them far too easy to modify, and even appear to encourage their modification. The boundaries should dictate development patterns; developers’ plans should not drive alteration of the boundaries:** that is a recipe for sprawl. Making the boundaries permanent through the GPU horizon will encourage efficient development within the boundaries; mitigation fees and tiered impact fees could be used to further efficiency also. Thank you for deleting the paragraph from the 2008 version beginning “Notwithstanding the foregoing criteria, the County may consider modification to a community UDB if it is determined that the Modification qualifies as a ‘regionally significant proposal’ through its following 4 bullet points , which was a wide-open growth-inducing invitation to sprawl. This is NOT what the people of this County want, it will work against compliance with AB32, SB375, and the County’s CAP, and it is definitely not needed. Innovation, mitigation, and financial benefits to the County can all be provided **within existing UDBs and HDBs.**

I17-75

Please change the “should” to “may” in the next to last bullet (p. 2-9). The GPU must work for efficient, cost-effective, walkable/bikable development. We must learn to live within our means.

I17-75  
cont'd

Please change the “should” to “shall” under the last bullet (p. 2-9), as Prime Farmland is an irreplaceable resource.

The GPU should include provisions for maintaining areas of Prime Farmland within UDBs, HDBs, and any other development boundaries in order to establish and maintain community-focused organic/sustainable agriculture to provide local food, learning opportunities, and recreation for the surrounding community. (This also applies to #3 on p. 2-10).

Thank you for including a requirement for sufficient water supplies under #2.

PF 2.2, # 2 (pp. 2-9 – 2-10) “Prior to approval of a UDB boundary expansion . . . may require . . . infrastructure master plan”: In the Matrix (p. 35) the suggestion that this wording be changed to “. . . the County shall ensure that infrastructure can be provided *and maintained* . . .” was rejected on the basis that “provided [implies] maintenance,” and that infrastructure is typically provided and maintained by CSDs and PUDs over which the County has limited control. This implies that the County then likewise could not ensure that infrastructure would be provided to service the new areas added to the UDB, in which case the new areas must not be added. Item #10 on page 2-13 requires that a Planned Community project set up funding mechanisms to cover initial capital costs as well as long-term operations and maintenance for infrastructure. Since #2 on page 2-7 is presumably resulting from a developer’s request to modify the community’s UDB, then it seems that the County could make the same requirements as in #11 on page 2-68.

I17-76

PF-2.2 #3 (p. 2-10): This Policy states that “preservation of productive agricultural lands shall be the highest priority when considering modifications” to boundaries, but the County should include as equal priorities evaluation of GHG emissions, water supply and quality, and air quality impacts. Strong, clear responsible growth policies and implementation measures will benefit all of these key economic and quality of life issues.

I17-77

PF 2.2, #3 (p. 2-10), Modification of Community UDB, Implementation #6 (p. 2-172 “The County shall define implementation standards for UDB and HDB expansions to avoid uncertainty”: Developing criteria for evaluating when non-ag lands are not reasonably available or suitable is key to the implementation of this important policy. It is not scheduled for implementation until 2015-2010. **NO UDB or HDB expansion should be allowed until these standards are adopted, and PF 2.2 #3 should so state.**

I17-78

PF-2.4 (p. 2-10) Community Plans: This Policy is meaningless because it doesn’t state how the County shall ensure that the plans are prepared, updated, and maintained. The County’s track record (7 of the 22 communities still have no plans at all, many of the plans are long overdue for update, and the County does not seem able or willing to provide staff and other resources necessary to accomplish these important tasks)

I17-79

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

indicates that “ensure” doesn’t mean much. It has already been several years since this Policy was written. Has any progress been made in that time?	I17-79 cont'd
PF 2.4 (p. 2-10), IM # 10 (p. 2-73) states factors for establishing priorities for community plan updates (per IM #9). However, the IM should indicate the order and weight of the priorities. In Three Rivers, whose community plan was adopted in 1980, a community plan update has been urged by the community for well over a decade, and the County has sporadically attempted to work on the update, but the process is nowhere near completion (not to mention the EIR).	I17-80
IM #11 (p. 2-73): Performance measures in the community plans are a good idea. These measures should definitely include those that would demonstrate AB32 and SB375 and TC CAP compliance, such as transit, complete streets, GHG emissions, affordability of housing, density, energy and water efficiency of development, LEED and LEED-ND certification, etc.	I17-81
PF 2.5 (p. 2-10) “Collaborative Community Planning Partnerships”: Please explain what is meant by “Requirements for New Town development shall be utilized to guide such private/public joint planning efforts.” It seems that if a developer is funding the community plan update, and this is being called a “private/public collaborative planning partnership” in the corresponding Implementation (#12, p. 2-74), the developer would have undue influence on the development of the community’s plan.  This new Policy and its Implementation need to be much clearer about who will be involved in the collaboration and what measures will <u>prevent conflict of interest and undue influence</u> on the plan on the part of the applicant(s). How will the County “encourage” such collaborative partnerships?	I17-82
PF-2.6 (p. 2-10) Land Use Consistency: This Policy states that community plan content “may change due to the new requirements such as Global Climate Change and Livable Community Concepts.” This should be revised to state that the plant content <u>will</u> change due to these requirements. It should have been changed already. All community plans should also include designated groundwater recharge areas and bioswales and wetlands for stormwater management. Development should include land reserved for organic/sustainable agriculture to provide food, learning opportunities, and recreation for the community, along with groundwater recharge opportunities where applicable.	I17-83
PF-2.7 (p. 2-10) Improvement Standards: This Policy should include as required urban standards the development of complete streets, Safe Routes to School, and extensive permeable paving. LEED-ND standards and the Ahwahnee Principles should be applied wherever possible. Streetscaping should comprise native and xerigraphic planting (including native large-canopy trees) and strictly controlled irrigation. Form-based codes and mixed use designations should be extensively applied.	I17-84

**Table 2.1 (p. 2-12) Community Plan Content:** Please include Safe Routes to School, complete streets, community agriculture reserve, groundwater recharge reserve, energy efficiency, water efficiency, LEED and Ahwahnee principles, GHG emission reduction, air quality impacts reduction, recreational area reserve, native/xerigraphic landscaping, and other responsible, healthy growth content as discussed above and below.

I17-85

**PF-2.10 (p. 2-11), IM #17 (p. 2-75):** This IM states that “context sensitive standards may be used to not overly burden existing residents” when implementing urban improvements in valley communities which previously had a UAB. **What does this mean? This IM should be much more clear and precise.**

I17-86

**Figures 2.2-1 through 2.2-22 (pp. 2-13 – 2-34) –Tulare County Communities Development Boundaries should be revised or augmented with text describing consistently for each the area comprised within the development boundary, the area already developed, the land use designations, the current densities (including vacancies), the current population and population projection for the 2030 project horizon, existing infrastructure and capacity (water, sewer, stormwater management, curbs, gutters, sidewalks, lighting), RDA status, and services (school, library, police fire, park and recreation, transit, etc.).** The maps alone do not provide nearly enough information for the reader to get a compact overview of these communities and their capacity for growth.

I17-87

**PF-3.2 (p. 2-35) “Modification of HDB”:** To protect water supplies and quality by minimizing hardscape and driving, to improve air quality by reducing VMTs, to improve health by improving air quality and promoting non-automotive travel, to preserve and protect natural resource lands, to reduce GHG emissions through more efficient development, **the GPR must place much stricter limitations on when an HDB may be modified.**

I17-88

The indicated boundaries are rendered almost meaningless and cannot function to limit urban development nor to provide an outstanding quality of life because **the policies make them far too easy to modify, and even appear to encourage their modification. The boundaries should dictate development patterns; developers’ plans should not drive alteration of the boundaries;** that is a recipe for sprawl. The HDBs are huge. The County should make the boundaries permanent through the GPU horizon to encourage efficient development within the boundaries; mitigation fees and tiered impact fees should be used to further efficiency also.

**At the least, please change to: “No change to an HDB shall be considered except during hamlet plan update, or unless an amendment is proposed to the HDB and the hamlet residents review and approve it (in addition to the requirement for a General Plan amendment).”** Expansion of an HDB should be a last resort to accommodate more development. If 80% of the non-Williamson Act land within the HDB is developed, then 20% is still available.

**Please modify the fourth bullet to require that the available 20% be used (possibly as park or groundwater recharge or recreation land) before allowing consideration of HDB expansion.**

NO NEED FOR BOUNDARY EXPANSION

Studies, including one by the County's own consultant, show that all of the growth projected under the GPU through 2030 could easily be accommodated in our existing incorporated cities alone, not to mention our unincorporated communities and hamlets (or highway corridors or New Towns). Therefore, there is obviously **NO NEED** to expand **ANY** of our existing growth boundaries during the course of this General Plan. And there are **MANY** vital reasons **NOT** to expand any of them (conservation of natural resource lands and working landscapes, groundwater recharge and flood control areas, scenic vistas, good agricultural land, less expense to taxpayers, greater opportunities for grant and other funding, increasing opportunities for walk-ability and bike-ability, allowing for transit, reducing the increase of VMTs and helping to limit increase of GHG emissions to comply with AB32, SB375, and the County's CAP, etc.).

The GPU should follow the principles of responsible growth and the clearly expressed wishes of the citizens of this county; the County should **not waste the taxpayers' money and further jeopardize their health and welfare by promoting development that is not contiguous to existing infrastructure, services, and employment opportunities.**

I17-89

**PF-3.2 #2. (p. 2-35) "Modification of HDB": "Prior to approval of a HDB expansion": Please make this enforceable by changing as follows: "If the expansion pushes the hamlet . . . master plan for the hamlet *shall* be prepared . . . ."**

**However, no significant development should be allowed to be planned in any hamlet until a hamlet plan has been completed** (with, of course, full public participation), or updated, if such a plan already exists, including a clear factual analysis of the hamlet's short and long term ability to provide necessary urban services. If we can't afford to prepare the hamlet plan, incorporating the desires of its residents, and evaluating its capacity, then how can we afford the consequences of ensuing growth?

The **Planning Commission has urged (Matrix p. 45) that hamlet plans require compact development.** The policies under LU-1 (pp. 4-22 – 4-23) are too weak: they only "promote," "encourage," and "support" the principles of smart growth and healthy communities; **please make them firm and enforceable.** The Implementation Measures are (p. 4-33 ff) similarly too vague and weak (e.g., #3, which says the County shall "consider" incentives to "encourage" smart growth during 2007-2010); **please make them concrete and measurable.** It's already 2010, and none of the hamlets have plans yet.

I17-90

**IM #18 (p. 2-75) states: "The County, led by the Planning Commission, shall conduct a citizen outreach effort in Tulare County hamlets, to prepare guidelines for the preparation of hamlet plans." The Implementation for the outreach effort to prepare guidelines for the preparation of hamlet plans was previously scheduled (2008 version) to begin in 2010-2015. Now it's not scheduled to begin until 2015-**

I17-91

<p>2020. Thus, many hamlets may have no plans during much of the GPU's timeframe (as many of the communities have not yet gotten plans after over three decades).</p> <p><b>Please strengthen these policies and implementation measures</b> to ensure that hamlet growth will be timely and responsibly planned on the basis of smart growth principles. (IM #18's suggestion of mixed use designations and appropriate use of form-based codes is a good place to start.) Again, compact, very efficient (in terms of use of land, water, energy, etc.) growth is our best chance of meeting the project's goals and the requirements of State law and our responsibility to the County's residents, current and future.</p>	<p>I17-91 cont'd</p>
<p><b>PF-3.2 #1, 4<sup>th</sup> bullet (p. 2-35):</b> Item #3 of PF-3.2 states: "The preservation of productive agricultural lands shall be the highest priority when considering modifications. Expansion of a HDB to include additional agricultural land shall only be allowed when other non-agricultural lands are not available to the community for expansion. The fourth bullet is confusing in its present location, as it implies that HDBs may expand onto farmland, whereas #3 says it's the highest priority not to do so. <b>The 4<sup>th</sup> bullet should be moved under #3 as a clarification of that part of the Policy.</b></p> <p><b>Please include an effective Policy and IM in this area also to require that prior to any HDB expansion, impacts to air quality, water supply and quality, and GHG emissions must be equally high priority considerations.</b></p>	<p>I17-92</p>
<p><b>PF-3.2 #2 (p. 2-35): Please change "should" to "shall" in the sentence</b> "If the expansion pushes the hamlet towards a community classification, an infrastructure master plan should be prepared . . . ."</p>	<p>I17-93</p>
<p><b>PF-3.3 (p. 2-36) Hamlet Plans:</b> This Policy is to be implemented by IM #18 (p. 2-75), IM #19 (p. 2-76), and IM #20 (p. 2-76). The Policy is important, because the County certainly should ensure that Hamlet Plans are developed with each of the hamlets' residents' input, and these plans definitely should be regularly updated and maintained. Thank you for including the all-important issue of long-term water availability and sufficiency. Obviously, if hamlet development is to proceed in an orderly and efficient manner that meets the needs and desires of their residents, the planning should occur BEFORE the development. <b>Please see comments on PF-3.2 and IM #18 above and apply them to PF-3.2 as well.</b></p>	<p>I17-94</p>
<p><b>IM #19</b>, to proceed to prepare an implementation schedule and budget for hamlet plan preparation after adoption of the guidelines, is also not scheduled to commence until 2015-2020. Again, it appears that many hamlets are unlikely to have plans for at least another decade, and, based on the results of the community plan efforts, not within the GPU horizon. <b>This is a serious deficiency, which should be remedied before any significant development is guided into the hamlets.</b></p>	<p>I17-95</p>
<p><b>IM #20</b> indicates that funding for plans is largely dependent on sources outside of County funds, which very much increases the uncertainty of any plans being provided within the needed timeframe by this Policy and these IMs.</p>	<p>I17-96</p>

**PF-3.5 (p. 2-136 “Improvement Standards in Hamlets”:** RMA states on Matrix p. 47 re comment on this Policy that the County will not stop development in hamlets while new standards are developed, which will not be until after adoption of the General Plan. **Recommendation: to guide development in the interim, the County should adopt the Ahwahnee Principles and require all interim development to adhere to them. LEED and LEED-ND (ND released 04/29/10) standards could also provide good guidance. This Policy and/or its IM #22, (p. 2-76) must make clear what will guide hamlet development until hamlet plans are developed and adopted. Please also define and clarify the meaning and intent of “context sensitive standards” for improvements.**

I17-97

**PF-3.6 (p. 2-36) Becoming a Community:** This Policy states that the Board of Supervisors, at its discretion, can designate a hamlet or other unincorporated place as a community. **Please explain the method and intent of this Policy. A hamlet is defined on p. 2-2 as an “unincorporated area that shares many of the characteristics of a community but on a smaller scale.” What changes when a hamlet becomes a community? What are the implications of the change? Where is the normal threshold for becoming a community? Why would the Supervisors designate an unincorporated place or hamlet as a community if it did not meet the definition of a community? What are the planning impacts of this?**

I17-98

**HAMLET MAPS, Figures 2-3.1 – 2-3.12 (pp. 2-37 – 2-48):** These maps should include what type of uses are proposed for each hamlet, and each map should include a textual profile of the area depicted, with information on the size of the area (current and proposed), the amount of land designated for each type of use (current and proposed), existing infrastructure and services (e.g., water supply, quality, and capacity; wastewater capacity; drainage and stormwater facilities; school, library, fire station, etc.), the population (current and proposed), RDA information, etc. The present maps show lots of empty space, but give no real idea of present uses and densities, current capability to support and serve additional development, and proposed project buildout configuration.

I17-99

**PF-4 (p. 2-49) Goal:** What are the “countywide economic development goals” that the following Policies are meant to carry out?

I17-100

**PF-4.1 (p. 2-49) “:** What is the intent and implication of changing this Policy title from “UABs for Cities” to “CACUABs for Cities?” The language in the first sentence has been changed from the 2008 version, which said “the cities concerns *are* to be given *serious* consideration” to 2010’s “the cities’ concerns *may* be given consideration.” Why is the County taking the position that it no longer must seriously consider the cities’ concerns? Why shouldn’t cities make the decisions regarding growth within their UDBs and UABs if growth is to proceed in an orderly manner and the cities will soon be providing the urban services to these areas.? An appropriate revenue-sharing agreement must be reached between the County and the cities. Perhaps this should be arbitrated, since after two years of discussion, they haven’t agreed. Why should any development be permitted in the UABs during the life of this General Plan when there is plenty of room for all the growth projected for the next 30 years within the existing UDB of the cities alone, per the County’s own consultant?

I17-101

Since “generally no public purpose is served by permitting intensive development therein,” **the County should establish greenbelt preserves between the urbanizing areas in order to maintain community identity, preserve open and agricultural land, maintain scenic landscapes, provide for recreation and habitat, help to clean the air and provide for groundwater recharge areas, etc.** Please explain why the County is going into the business of developing within these CACUABs when it has not adequately supported the development already established in the unincorporated areas. **Why not put development in already developed areas, where a workforce, infrastructure, and services already exist, to benefit existing developed areas and reduce VMTs, GHGs, and cost to taxpayers? When are these CACUDBs going to be established, and how?**

I17-102

**PF-4.2 (p. 2-49): What is the intent and implication of changing this Policy title from “UDBs for Cities” to “CACUDBs for Cities – Twenty Year Planning Area?”** The first sentence has been changed from 2008’s “the County and cities *will* coordinate plans” to 2010’s “the County and cities *may* coordinate plans.” What is the cause of this Policy change? **Why shouldn’t cities make the planning decisions within their UDBs designated by the County, since the cities have to provide the urban services there?** Please see Matrix comments, p. 31, re PF-1.7. The second paragraph under PF-4.2 says “Within this boundary, the County may also establish planning areas representative of shorter time periods in order to assist in more precise implementation of plans and policies.” In 2008, this read “*community* plans and policies.” **What are the ramifications of this change?**

I17-103

**PF-4.3 (p. 2-50):** The 2008 version said, “the County *shall* consider modification of UABs and UDBs at such time as the land use plan for a city is revised,” but the 2010 version says, “the County *may* consider modification of CACUABs and CACUDBs at such time.” **Please explain why this change from mandatory to permissive has been made.**

I17-104

**PF-4.3 (p. 2-50):** The second sentence in 2008 said, “Preservation of productive agricultural lands and operations *shall be of the highest priority* when considering such modifications.” The 2010 version says “Preservation of productive agricultural lands and operations *shall be one consideration* when considering such modifications.” **Please explain what has caused this change in priorities, and what the other considerations will now be, along with preservation of agricultural lands and operations. Please ensure that this Policy states that these other considerations will include impact to air quality, GHG emissions, and water supply and quality.**

I17-105

**PF-4.3 (p. 2-50):** The third sentence in the 2008 version, “Expansions for residential or other sensitive land uses will be discouraged if the boundary is currently, or will be when expanded, within one mile of an active dairy,” has been eliminated in the 2010 version. **Please explain why this provision is gone, and whether this means that there are now to be no restrictions on sensitive land uses in proximity to dairies. Has public input been solicited regarding this change?**

I17-106

**PF 4.3 (p. 2-50):** The third sentence in the 2010 version is new: “Cities may examine existing CACUAB and CACUDB lines and recommend changes to the Board of Supervisors, as appropriate.”

**PF-4.4 (p. 2-50):** The 2008 version said, “The County acknowledges that the cities have primary responsibility for planning within their UDBs and are responsible for urban development and the provision of urban services within their UDBs.” The 2010 version says, “The County acknowledges that the cities have an interest in planning for growth within CACUDBs [sic] and will in the future become ultimately responsible for urban development and the provision of urban services within those areas upon annexation.” **Please explain how this huge shift in the County’s stance will affect planning in the UDBs/CACUDBs. How will this provide for planning and development that is more orderly, efficient, cost-effective, and beneficial to the residents of Tulare County?**

**PF-4.5 (p. 2-50):** The 2008 version said, “City UDBs and the SOI as administered by the LAFCO *should be consistent at all times* insofar as it is administratively feasible to do so.” The 2010 version says, “CACUDBs and the SOI as administered by LAFCo *may be consistent* insofar as it is feasible and appropriate to do so.” **Please explain the rationale for this significant change in emphasis and meaning.** It appears that the County’s intent is to minimize the authority and jurisdiction of not only the cities, but also LAFCo. Is this correct? If so, **why is this a better method of operation for the citizens of Tulare County?**

**PF-4.6, (p. 2-50) Orderly Expansion of City Boundaries:** The 2008 version said, “The County shall encourage orderly outward expansion of urban development by supporting those city UDB expansion proposals where the city has demonstrated a need for additional territory after documenting a good faith effort to implement programs for infill development and/or increased efficiency of development and minimize conversion of agricultural lands.” The 2010 version says, “When the County is considering outward expansion of County adopted city UDBs, the following criteria shall be encouraged.” **What is the rationale for this shift in emphasis and methodology, and how will it promote better planning and development?** The first bullet in the current version includes the “city has demonstrated need” language from before. The 2008 version next stated, “Evidence that expansion will minimize conversion of agricultural land requires a showing that at least 80% of the non-Williamson Act land within the existing UDB is developed with urban uses.” **Why has that requirement been eliminated from the current Policy? How does that further the goal of protecting agricultural and opens space lands and providing for efficient development? The 2008 provision should be re-instated in the 2010 version.**

The current (2010) version has only the statement (second bullet) that “UDBs should not be expanded onto Prime Farmland if Farmland of Statewide Importance or of lesser quality is available and suitable for expansion.” **Please change “should” to “shall” to protect irreplaceable Prime Farmland.** (IM #24, p. 2-77, does say, “The County shall, when evaluating city General Plans for adoption, consider evidence provided that any proposed boundary expansion minimizes conversion of agricultural land by demonstrating that at least 80% of the non-Williamson Act Land within the existing UDB is developed with urban uses.” This IM certainly does not have the force and effect of the 2008 version of the Policy.)

**IM #25 (p. 2-77) pertaining to PF-4.6** states that the “County shall work with the cities to develop a streamlined process for review of city General Plan updates and amendments.” **It must be ensured in this**

25

streamlining process that the public's opportunity for review and comment of such updates and amendments not be rushed or minimized.	I17-111 cont'd
IM #26 (p. 2-77) – Why is this significant? Why should an assessment district need to be established as part of annexing unincorporated residential areas? Why shouldn't the County be taking care of this in the first place? Is this a result of all the hassles over areas such as the Matheny Tract?	I17-112
PF-4.7 (p. 2-50): The 2008 version said, "The County <i>shall</i> oppose any annexation proposal that creates an island, peninsula, corridor, or irregular boundary . . . ." The 2010 version says "The County <i>may</i> oppose . . . ." Why has this Policy been changed? Has the nature of islands, peninsulas, corridors, and irregular boundaries changed, along with how they should be serviced?	I17-113
PF-4.8 (p. 2-50): The 2008 version said, ". . . the County <i>shall</i> maintain General Plan land use designations that are <i>consistent</i> with the city's adopted General Plan" on land within a city's UDB, but outside its incorporated limits. The 2010 version says "the County <i>may</i> maintain General Plan land use designations that are <i>compatible</i> with the city's adopted General Plan." Please explain how this change will ensure orderly, well-planned, cost-effective growth and development. If the County no longer will maintain GP consistent land use designations, what is its intention? This sounds like a plan for incompatibility and inconsistency, which is not good design or sound planning. Please return to the 2008 language: "shall," NOT "may." The County must maintain land use designations consistent and compatible with the city's within these boundaries.	I17-114
PF-4.9 (p. 2-50) Updating Land Use Diagrams in CACUDBs: The 2008 version said, "Any unresolved conflicts between the County and city plans shall be identified for the decision-making bodies." The 2010 version states, "Any unresolved conflicts . . . shall be identified for the Board of Supervisors." Why would the Board of Supervisors be the only decision-making body involved in such conflict resolution? How has the County demonstrated a superior record of decision-making in the areas of planning and development in Tulare County?	I17-115
PF-4.10 (p. 2-51) City Design Standards: The 2008 version said, "the County <i>shall</i> require the project to meet the development standards of the city in question" when the BOS approves development within the UDBs of incorporated cities. The 2010 version says, "the County <i>may</i> require the project to substantiate sufficient water supply and meet the County adopted city development standards of the city in question." Again, this is a recipe for haphazard growth, and unless the County's development standards are demonstrably superior, the city's standards should be met. Please change the wording to "shall require the project to substantiate sufficient water supply for the life of the project."	I17-116

**PF-4.12 (p. 2-51) Compatible Project Design:** The “may” of the 2010 version should replace the “shall” of the 2008 version, as it is very important that proposed development in CACUABs be compatible with future sewer and water systems and circulation networks as shown in city plans. The alternative is inefficiency and great expense to the taxpayers down the road.

I17-117

The GPU’s policies should demonstrate that the County is thinking of long-term sustainability, cost-effectiveness, health, efficiency, and public benefit. Policies such as the ones in this Element seem very short-sighted, expensive, and not in the public interest.

I17-118

**PF-4.13 (p. 2-51) Coordination with Cities on Development Proposals:** This is yet another policy that is totally transforming the Planning Framework without any indication of how the changes will benefit the residents of Tulare County. The 2008 version very sensibly said, “The County shall promptly notify a city whenever activities requiring discretionary actions in unincorporated areas fall within a city’s UAB. The opinions and recommendations voiced by the city should be given strong weight in rendering the final decision.” The 2010 version says, “The County shall ensure that urban development only take [sic] place in County Adopted City UDBs if one of the following has occurred: 1. The adjacent city does not consent to annex the property for development . . . 2. Annexation is not possible under the provisions of State law, but it is determined by the County that development of the site does not constitute incompatible development.” **Please explain why this change is being made. How will this promote orderly, cost-effective, adequately served, and compatible development? What makes the County a better judge of compatibility with city requirements than the city?**

I17-119

**PF-4.3--PF-4.10 (pp. 2-50 – 2-51):** Same comments as in PF-3 regarding hamlets. **Please adopt and adhere to the Ahwahnee Principles and the wishes of the public: expand existing development boundaries only as a last resort.** Inefficient development is the root of many of our problems with air quality, water supply and quality, GHG emissions, health, rapid loss of our natural resource lands, and diversification and strengthening of our economy. We do NOT need, nor given the requirements of AB32 and SB375, can we afford, ANY more of that. The County should provide for denser, more convenient, clustered, pedestrian- and transit-friendly development with a good jobs/housing/services/recreation balance.

I17-120

**PF 4.14 (p. 2-151) “Revenue Sharing”:** The policy says that the County will “promote” revenue sharing as an element of negotiation under certain circumstances.

I17-121

**Implementation measure (#26, p. 2-77)** says the County “will consider exploration of processes for furthering revenue sharing with individual cities. If a revenue sharing agreement is entered into with an affected city, the County *may* limit development in a CACUDB, consistent with the General Plan.” The

27

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

County has been talking for years about revenue sharing agreement with the cities. Perhaps it is time for mediation or arbitration on this issue. Given the County's arrogation of decision-making authority regarding CACUDB development in the present version of the draft General Plan Update, it would appear that cities offering revenue sharing would be no better off. **This IM makes it clear that County is making no guarantees on its part, which is certainly detrimental to sound and cost-effective planning. Where's the "promotional" part of this Policy and IM?** The Policy now offers an additional incentive, not part of the 2008 version: "As an additional incentive for directing urban growth into cities, any city proposing changes to a County Adopted City General Plan or other County land use regulations shall pay to the County its cost in considering and implementing such proposal."

I17-121  
cont'd

**Please provide a definite implementation methodology and timeline for getting a workable revenue-sharing agreement finalized.** Perhaps some type of mediation or "Model Cities/Model Counties" intervention is needed. Please see Matrix p. 31, comment re PF-1.7. The commonweal suffers while the cities and County fail to resolve this important issue.

**PF-4.24 (p. 2-54) Annexations to a City within the CACUDB: Please change "may" to "shall" in the first sentence:** "... the County *shall* work with a city to provide that urban development ... will be referred to the affected city for consideration of annexation ... ." For these boundaries to mean anything, the County must refer all projects to the cities within the CACUAB for potential annexation.

I17-122

**PF-5.1 (p. 2-67) "New Towns":** Tulare County already has about 40 communities (including cities, unincorporated communities,, and hamlets, not to mention all the Mountain Service Centers and the neighborhoods); the County's residents have no need or desire for more. They want growth focused in their existing communities, and it is strongly in the interest of sound planning, better air quality, lower GHG emissions, fewer VMTs, water availability and quality, public health, a sounder economy, the preservation of agricultural and open space lands, the provision of habitat and recreational lands, compliance with AB32, SB375, and the precepts of Tulare County's Climate Action Plan, etc. to PROHIBIT the development of New Towns and put new growth where infrastructure, services, and workers already are. The 2008 version said, "The development of new communities should be discouraged, at least to the extent that haphazard attempts at community development away from established urban centers should be discouraged." The 2010 version says, "The haphazard development of communities should be discouraged." The people of Tulare County say, "No New Towns." The County states that New Towns will "provide for orderly development of new areas within the County when appropriate to meet the social and economic needs of current and future residents," but **what social and economic needs require a New Town? Why can't these needs be met in our very various and numerous existing communities, so that we don't have to cut up and pave over a lot more of our agricultural and open space lands, irrevocably diminishing our rural heritage and character?** The Policy states that the new/planned community would have "its own mix of residential, commercial, industrial, public use areas and related facilities," but it doesn't state **why that "mix" could not be developed within existing**

I17-123

UDBs and HDBs without sacrificing greenfields, agricultural lands and scenic landscapes, while locating people far from existing infrastructure and services. Who would judge the New Town “as it would affect the area as a whole and other policies and proposals of the General Plan?” Would residents of all the nearest communities be able to have a say? What is the rationale for discarding the County’s current communities, as if they have nothing to offer, and to build a wasteful and expensive New Town instead? The County must be certain to consider impacts such as excess VMTs, GHG emissions, air quality, water supply and quality, traffic, services, public health and safety, and compliance with State laws (e.g., AB32 and SB375).

I17-123  
cont'd

**PF 5.2 (p. 2-67)** “Criteria for New Towns (Planned Communities)”: Policy (5.2) says that a New Town must be a planned community; however, **a planned community certainly does not have to be a new town.** Planned communities are not the issue. New Towns/planned communities located outside of existing development boundaries are the issue. Please **ADD to this Policy a numbered point stating that a planned community shall not be approved anywhere outside of existing development boundaries (UDBs, HDBs).** All the elements of a planned community can be contained within such boundaries. Permitting development outside of these boundaries during the term of this General Plan would induce more sprawl development and would unnecessarily, and to the detriment of the health and safety of the citizenry and their expressed priorities, increase GHG emissions and VMTs and further erode the County’s ability to comply with AB32, SB375, and its Climate Action Plan.

I17-124

**PF-5.2, item #3 (p. 2-67):** The County should require that the proposed project be required to have a fiscally neutral or positive impact on the County **through each and every phase** of its development and projected life.

I17-125

**PF-5.2, item #4 (p. 67):** The County should require that the infrastructure master plan evaluate sizing and extensions of infrastructure necessary to serve all phases of the development and any future planned development of adjacent areas, including a fiscal impact study analyzing costs of new demand for necessary infrastructure and services on both a short- and long-term basis, how they will be funded, and potential funding shortfalls.

I17-126

**PF-5.2, item #6 (p. 2-67):** This paragraph was #5 in the 2008 version, which had basically the same stakeholders list. BUT there is a significant change in the 2010 version for ONE of the stakeholders. The 2008 version includes “any applicable local planning committee.” The 2010 version says “applicable local planning committee established by the Board of Supervisors or Planning Commission.” **Please clarify how this revision will improve public outreach and opportunities for public input to these critical planning programs.** There is no IM for this Policy. **How would the Board or Planning Commission establish such local planning committees? Since the New Town/planned community is recognized as affecting “the area as a whole,” how is this reconciled with a “local planning committee?”** Please provide a clear IM for this item.

I17-127

**PF-2.5, item #7 (p. 2-68):** This item was #6 (p. 2-13) in the 2008 version, which included the provision that “the Chairman of the Board of Supervisors sign the reimbursement agreement and any amendments or related documents subject to approval by County Counsel as to form.” **Please explain why this provision has been removed from**

I17-128

the 2010 version and the ramifications of this. Who will sign these documents now? Will they still be subject to County Counsel approval? | I17-128  
cont'd

PF-5.2, item #9 (p. 2-68): Thank you for including this vitally important requirement. Please clarify in this Policy that “adequate” means both in quantity and in quality, that the impacts to the source of the water supply and its existing users must be documented and mitigated if necessary, that the supplies must be demonstrated to be sustainable for the proposed life of the proposed development (including the ability to provide water and treat wastewater during peak periods and during sustained drought), and that the documentation must be prepared and submitted by a neutral third-party expert and be satisfactory to the County. The County should also consider the energy required to deliver water to the proposed development throughout its projected life and the related GHG emission impacts. | I17-129

PF-5.2, item #10 (p. 2-68): The County should also require the applicant to provide information on anticipated home prices, rental rates, and dwelling sizes and ensure that there is sufficient diversity in housing types, sizes, and costs, including a detailed tabulation of the resultant densities of persons, dwelling units, building coverage, paving coverage, landscaped areas, and height of structures. Additionally, the County should require that a fixed number or percentage of the dwelling units be constructed as, and covenanted to be preserved as, affordable/inclusionary housing. In accordance with the requirements of the ordinances of other jurisdictions in California which have adopted PC Zone ordinances, the County should require that any New Town/planned community produce a distinctive and environmentally sound project of the highest quality and efficiency as evidenced by specific findings, with more economical and efficient use of the land, while providing for diverse and affordable housing, mixed use, amenities such as recreational and community facilities, and preservation of natural and scenic and cultural qualities and open space, along with detailed requirements for specific analysis and reporting of plans, infrastructure capacities, anticipated home prices and rental rates (including a housing market analysis and commercial/industrial market analysis satisfactory to the County demonstrating need and the public benefits that will result from the development). New Towns/planned communities must be required to focus on non-automotive oriented modes of transportation, and provide ongoing mitigation for loss of habitat, agricultural land; they must include open space (40% minimum), dwellings and commercial structures built to LEED and/or LEED-ND standards, cluster development, highly energy- and water-efficient buildings and landscaping, recycling, shielded exterior lighting, permeable paving, groundwater recharge and natural stormwater capture and treatment, etc. | I17-130

PF-5.2, item #11 (p. 2-68): The County should additionally require that the project also provide infrastructure for active and alternative transit. The project must also reserve areas for effective groundwater recharge and natural stormwater management. | I17-131

PF-5.2, #12 (p. 2-28) Please CHANGE from “Planned communities *should not cause*” to “*shall not cause*” conversion of Prime Farmland., in order to be consistent with the goal of preserving the County’s irreplaceable Prime Farmland. The County should require that Prime Farmland be permanently conserved within New Towns/planned communities in order to provide sustainable/organic food for the adjacent/surrounding community, | I17-132

30

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

along with learning and recreational opportunities for the residents. This could also help to mitigate for GHG emissions, provide for groundwater recharge, and retain open space.	I17-132 cont'd
<b>PF-6.2 (p. 2-68):</b> The 2010 wording is the same as that in 2008 except that the condition “as appropriate” has been added after “ensure that the County and the public are involved.” <b>Why has this change been made? Who determines what’s appropriate?</b>	I17-133
<b>PF-6.2 IM #30 (p. 2-78):</b> This surprising IM (which seems unrelated to the gist of PF-6.2) states that management of the State and federally owned lands in the County should include “provisions for continued and improved access through and within the County.” <b>What does this vague measure mean?</b> Is it implying that there should be more roads through the federally owned lands? <b>The purpose of the management of these lands is certainly NOT to facilitate access through the County, but is instead to protect irreplaceable resources for the public good and to manage them sustainably.</b> If “improved access to” means the provision of less-polluting public transit, such as the recently-introduced bus service from Visalia to Sequoia National Park, then we’re all for it.	I17-134
<b>PF-6.4 (p. 2-69):</b> The 2008 wording (p. 2-14) said, “The area within the UDB should be considered as the same area for which water and sewer system planning is accomplished.” The 2010 version starts with the same words, but then changes: “. . . area for which water and sewer system planning may be needed and to be a consideration in the determination of an area required to adequately assess the availability and sufficiency of water supplies.” Thank you for including the critical concern of water sufficiency.	I17-135
<b>PF-6.7 (p. 2-69) Public Outreach:</b> <b>This Policy should include a requirement for meetings and other activities to be held in the evening, after normal working hours, to enable the working public to attend without having to miss work in order to participate.</b>	I17-136
<b>PF-7.1 (p. 2-69 Annual Review:</b> The 2008 version specified that the Planning Commission was to report to the Board of Supervisors its annual review of the GP GPR implementation actions “ <i>during the fall quarter of each year.</i> ” The 2010 version says that the report will be “per Government Code Section 65400.” This section requires the planning agency “to provide by April 1 of each year an annual report.” <b>So when will Tulare County’s annual review be provided? This information should be stated in this Policy (as it used to be), so that the public will know when to expect it, and reporting for CEQA and EIR purposes will be certain.</b> The 2008 version said, “This annual report <i>shall</i> also be used to satisfy the requirements of the Public Resources Code (Section 21081.6) for a mitigation monitoring program.” The 2010 version is revised to say, “may also be used.” <b>If the annual GP GPR Report “may” or may not be used to satisfy the mitigation monitoring program requirements, then what report will do so? It is important that the public know when this information will be reported, and also very important for EIR mitigation and monitoring accountability.</b>	I17-137

**PF-7.2 (p. 2-69) Maintaining a Current General Plan:** The second sentence is new: “The County shall maintain and shall collect a General Plan, Unincorporated Community Plan, and Code Maintenance fees at building permit issuance as established by the Board of Supervisors, to insure that the resources are available to fund the required updates of the General Plan.” This seems to be a fiscally prudent Policy, since, after over 30 years, 7 of the 22 unincorporated communities still have no plan at all, and many of those that exist are overdue for updating. But what about Hamlet Plans, since none of the Hamlets have them? Why are these not included in this Policy? And what about plans for the Mountain Service Centers?

I17-138

**PF-7.3 (p. 2-70) Maintaining Planning Consistency:** Same comments as for PF-7.2 above.

I17-139

## COMPONENT B – TULARE COUNTY PROSPERITY

**B. Prosperity (pp. B-1 and B-2);** (see also Matrix, p. 85, #1): To improve its quality of life, attract investment, protect its agricultural economy, and promote self-sustaining communities, Tulare County must vigorously address its water crisis, its air quality, its GHG emissions, and its land use and development policies. This page recognizes that Land Use principles are an important element in a plan for prosperity, but fails to mention the extremely critical areas of air quality (and its health and economic impacts), water supply and quality (fundamental to everything), and global climate change, which is already impacting Tulare County and has major implications for its future prosperity. Both Agriculture and Land Use principles and policies are discussed elsewhere, but are still selected for mention on these pages. Air, Water, and Global Climate Change deserve equal mention, along with reference to the other Chapters in which they are further discussed.

I17-140

**B. Prosperity Component (p. B-1):** The first paragraph states that the General Plan “uses communities and hamlets to accommodate new County growth while encouraging a majority of growth to occur within incorporated cities.” However, the current version of the GP proposes extensive development outside of communities and hamlets, almost anywhere along the County’s highways and in undesignated locations for New Towns/planned communities, which apparently could be located almost anywhere in unincorporated areas of the County, which would clearly be detrimental to agriculture, natural resource lands, existing communities and hamlets, air quality, water supply and quality, and curbing GHG emissions. The GP should return to its prior focus, which would be a much more sustainable approach to long-term prosperity.

I17-141

**B. Concept 2 Land Use (p. B-1):** Same comment as directly above. The County should describe in the GP what its options are to actually limit conversion of agricultural and natural resource lands to urban uses, such as utilizing lands that the County owns, zoning, or other methods.

I17-142

**B. Concept 4 Housing (p. B-1):** In the first line, “counties” should be “county’s.”

I17-143

32

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

**Agriculture Principle 2 “Maintain Separators” (p. B-2):** The Matrix (p. 86, #1) states that rural landscape Separators between the County’s towns and cities are **mapped in Figure 7.3-1**. This Figure has not appeared in the 2008 or 2010 version of the GPR. Email from David Bryant, 2/19/08, says the sentence re Figure 7.3-1 s/b deleted, and to see Policy 3.2 on p. 7-4 of the GPU. This Policy is on p. 7-6 of the 2010I version. We believe **such a Figure is still needed; please provide it** (does SL-3.2 imply that the separators have not yet been defined?) **Rural landscape separators are very important fulfilling many of the GPR’s goals and policies, including maintaining community identity, maintaining the county’s scenic landscapes, maintaining important natural resource lands (agricultural, open space, habitat), addressing global climate change, and providing for recreational opportunities. If these separators aren’t designated and mapped now, there is little hope that there will be any. Please provide an appropriate Figure of a land use map designating where these rural landscape separators will be located, and act swiftly to ensure that they will be preserved before it’s too late.** | 117-144

**Land Use Principle 4 (p. B-2):** Same comment as immediately above for Agriculture Principle 2. | 117-145

**Housing (p. B-2):** “State *Legislator*” should be “State *Legislature*.” | 117-146

## 3. AGRICULTURE

**At the top of page 3-1, “Animal Confinement”** was listed as a section of the Agricultural Element in the 2008 version. It is not there in the 2010 version. This is a critical omission because Animal Confinement Facilities are a huge component of Tulare County’s agriculture (and of its economy and of its GHG emissions). **Please restore this key section to the Agriculture Element, which cannot be discussed meaningfully without it.** | 117-147

**Key Terms – “Grazing Land” (p. 3-1):** Unlike intensive agricultural lands, extensive agricultural lands (used for grazing) typically do not pollute air and groundwater with toxic chemicals, nor do they produce much in the way of GHG emissions. They can provide for groundwater recharge, protection of watersheds, flood management (when not severely overgrazed) maintenance of scenic landscapes, and carbon sequestration. **In striving to meet AB32 goals and to ameliorate the County’s water emergency and to address the County’s GHG emissions, protection and preservation of grazing lands can be a very important strategy. Please revise the second sentence to include these benefits.** | 117-148

**Farmland of Local Importance (p. 3-1):** “Statewide *Import*” should be changed to “Statewide *Importance*” in the second sentence. | 117-149

**Agriculturally-Designated Lands (p. 3-1):** This sentence has been changed from the 2008 version: it now shows only "Foothill Agriculture and Valley Agriculture." **What happened to "Agriculture Intensive," and "Agriculture Extensive?" Why has this change been made, and how does it affect the meaning of land use designations? Does this affect the maps?** | 117-150

**Urban Development Boundary (p. 3-3):** This definition is not consistent with the definition in the Planning Framework (p. 2-3). **Please apply here also the comments made on that section.** | 117-151

**Existing Conditions Overview (p. 3-4):** Agriculture value in 2005 (per the 2008 GPR) was \$4.3 billion. In 2008, per the 2010 GPR, it was \$5.01 billion [actually, \$5,018,022,800 total gross production value, per the 2008 Tulare County Annual Crop and Livestock Report]. This represents a huge increase in three years, and, since agriculture is the economic engine of the county, one would assume that it had a huge effect on the economic health and quality of life in the county. **The General Plan should examine this relationship more closely and present a cost/benefit analysis of this major industry and its chief components on the economic and physical health of the county. Simply presenting total gross production value is not a satisfactory measure of the importance and impact of agriculture, and the net value (and not just in dollar figures) should be reported as well. The Background Report and the RDEIR should both substantially address this, because it should figure substantially in planning and land use for the County's next 20 years. The figures in the 2008 GPR compared with those in the 2010 GPR show that over 5,000 acres of Prime farmland were converted from 2004 to 2006. What is the economic impact of such conversion?** | 117-152  
| 117-153

**Animal Confinement Facilities Plan (p. 3-4):** Animal confinement facilities (e.g., dairies, feedlots, etc.) are a major component of agriculture and the economy in Tulare County, and milk is far and away the County's single leading commodity. **The County's failure to substantively address these facilities in the GPU documents constitutes a major omission and detrimentally limits the public's understanding of the importance of AFCs to existing conditions in the County, environmental impacts in the County, and the adequacy of the County's related Policies and Implementation Measures and mitigation measures. The new Climate Action Plan points out that 63% of the GHG emissions in the unincorporated area of the County are from dairies and feedlots (the next largest source is Mobile Sources, at 16%). The County should revise the GPR, the BR, and the RDEIR to include substantially more information related to this key subject, in proportion to its importance to all these aspects of the GPU. To simply state that the County has a Plan, which is incorporated as Chapter 12 in the GPR (when Chapter 12 has no contents other than a paragraph stating that the Plan is incorporated) gives the public no understanding of the history, challenges, and problems associated with this Plan, which is still being worked on. Without much better coverage of the ACFP, this GPU is inadequate, misleading, incomplete, and certainly fails to examine and disclose the potential significant adverse environmental impacts of a major component of the County's land use, agriculture, and economy, affecting** | 117-154

air quality, water supply and quality, GHG emissions, soil, flora, fauna, public health (and, in some cases, scenic landscapes).	I17-154 cont'd
--	-------------------

AG-1.1 (p. 3-4): Does agricultural land return a higher net benefit economically to the County because it costs less in terms of County services and infrastructure than other uses compared to its yield? Does agricultural land create fewer adverse environmental impacts than urbanized land? <b>These questions should be addressed in the Background Report and RDEIR. Also, what is the logical relationship between AG 1.1 and AG-1.5, the first of which strives to maintain agriculture as the primary land use and the second of which may work to remove land from Williamson Act Contracts.</b>	I17-155
--	---------

IM#1 (p. 3-9) states that the County “shall take the lead” [ongoing] to work with cities and TCAG to establish a comprehensive agricultural land mitigation program. <b>This is NOT a satisfactory IM because there is no way to measure it and no timeframe for accomplishing the implementation of the program. For how long has the County been taking the lead, and where are the results? This Policy and its IM will not serve as mitigating and implementation measures for the RDEIR.</b>	I17-156
---	---------

AG-1.3 “Williamson Act” (p. 3-4): The County downgraded this policy from “ <u>shall</u> ” promote to “should” promote. Given the importance of agriculture to the County, and the importance of the Williamson Act to agriculture, <b>why was this change made? Please change it back.</b> If the State subvention program is not funded, how will the County’s policies on Agriculture Preservation change?	I17-157
--	---------

IM#2 (p. 3-9) states that the County shall review preservation programs and assess their effectiveness (ongoing).	
---	--

IM #3 (p. 3-9) states that the County shall maintain a database of agricultural preserves and review it to determine whether any unincorporated community is being unduly constrained or confined by Williamson Act land.	
---	--

<b>This Policy and its IMs clearly will not serve as mitigating and implementation measures for the RDEIR. “Should” is not a Policy and reviewing and assessing will not mitigate loss of agricultural resources.</b>	
---	--

AG-1.4 “Williamson Act in UDBs and HDBs” (p. 3-4): <b>How many acres are comprised in the new HDB areas, where RVLP will no longer apply?</b> This Policy states that the County shall support non-renewal and cancellation of Williamson Act contracts. Why couldn’t Williamson Act land in UDBs and HDBs be kept in the Williamson Act for land conservation purposes and used as much-needed recreational space, open space, habitat, groundwater recharge, or community supported agriculture?	I17-158
--	---------

IM#2 (p. 3-9) has already been discussed.	I17-159
---	---------

IM #3 (p. 3-9) states that the County will regularly review agricultural preserves within UDBs to determine whether the community “is unduly constrained or confined” by Williamson Act land. <b>The County should</b>	I17-160
--	---------

also consider whether the community is utilizing land for development efficiently, per smart growth and liveable communities principles.	I17-160 cont'd
IM #3 "County shall maintain comprehensive database of ag preserves" (p. 4-7): This measure does not promote the long-term preservation of productive and potentially-productive agricultural lands. This IM should include a mitigation measure with a ratio of at least 1:1 or better for the conversion of such preserves to urban development, preferably one that ensures that the protected lands are located within the County and are part of an established mitigation banking program.	I17-161
This Policy and its IMs will not serve as mitigating and implementation measures for the RDEIR for conserving agricultural resources.	I17-162
AG-1.5 (p. 3-5): States the County may work to remove parcels from Williamson Act contracts IM#2 and #3 (p. 3-9) have already been discussed. This Policy and its IMs obviously will not serve as mitigating and implementation measures for the RDEIR for conserving agricultural resources.	I17-163
AG- 1.6 "Conservation Easements" (p. 3-5): Comments on this Policy (Matrix, p. 101) urged the County to adopt mitigation measures for the loss of agricultural land, such as requiring conservation easements and requiring developers to pay into a mitigation fund to be used to purchase development rights for agricultural land of the same classification of the land to be developed. The County responded that impact fees for agricultural land conversion would not be feasible without cooperation from the cities and a countywide approach. The RDEIR states (p. 3.6-45) that the City of Visalia" has imposed a land based charge on lands being converted from agricultural to urban uses to address the shift of water supply from a conjunctive use basis to that of exclusive groundwater." Is this an impact fee for agricultural land conversion? Has the County polled the cities on their interest in cooperating in such a policy?	I17-164
The RDEIR states (p. 3.10-15) that the County will "coordinate regional efforts to preserve farmland or slow the conversion of farmland within Tulare County." In the 2008 DEIR, (p. 3.8) to mitigate for the loss of important farmlands, revised policy AG-1.6 was required. On p. 3-9, AG-1.6 stated, "the County <i>shall</i> develop an Agricultural Conservation Easement Program . . . . This program <i>shall</i> require payment of an in-lieu fee . . . . [which] <i>shall</i> recognize the importance of land value and shall require equivalent mitigation." The revised Policy AG-1.6, which "would be required," is now located on p. 3-5 of the 2010 GPR, but IT HAS BEEN CHANGED to "the County <i>may</i> develop" and "this program <i>may</i> require." "May" is not a Policy statement; "may" is not a specific course of action. AG-1.6 no longer serves as a mitigation measure for the RDEIR.	I17-165
Furthermore, the text of AG-1.6 on p. 3-5 of the GPR does NOT include some of the language in AG-1.6 on p. ES-10 of the RDEIR. Please correct this discrepancy. The RDEIR version includes "The ACEP may be used for replacement lands determined to be of statewide significance (Prime or other Important Farmlands), or sensitive and	I17-166

necessary for the preservation of agricultural land, including land that may be part of a community separator as part of a comprehensive program to establish community separators.”	I17-166 cont'd
<b>The title of AG-1.6 in the RDEIR needs to be corrected from <i>Conversion Easements to Conservation Easements</i>.</b>	I17-167
<b>IM#1 (p. 3-9)</b> states that the County “shall take the lead” [ongoing] to work with cities and TCAG to establish a comprehensive agricultural land mitigation program. <b>This is NOT a satisfactory IM because there is no way to measure it and no timeframe for accomplishing the implementation of the program.</b> For how long has the County been taking the lead, and where are the results?	I17-168
<b>IM #5 (p. 3-10)</b> is the only other IM for AG-1.6. It says only that the County shall work with others to establish criteria for the locations for agricultural conservation easements. <b>Establishing criteria for locations does NOT mitigate anything. Only conserving suitable locations will provide mitigation.</b>	I17-169
<b>This Policy and its IM are useless.</b>	
<b>How will the County go about establishing this program?</b> An article in the Fresno <i>Bee</i> on 07/22/07 titled “Trust seeks to keep farmland free of development” stated that Tulare County’s Sequoia Riverlands Trust includes in its mission conservation of farmland, and that the Great Valley Center in Modesto has urged the Trust to work on farmland conservation. Is the County working with the Trust on a program to conserve farmland?	I17-170
<b>Hasn’t most of the farmland on the valley floor already been classified (e.g., as Prime, Statewide Importance, etc.), so that the County already knows where the best farmland is?</b> Has the County applied to the State’s Resources Agency for funds for farmland mitigation? Is the County considering a developer impact fee for farmland mitigation?	
<b>Both IMs (#1 and #5) are too vague to be measured or enforceable and should be made specific and given a deadline for establishment of the mitigation program and the locations for the conservation easements. How can this Policy and its IMs serve as mitigation for the GPU’s impacts if the conservation program is not adopted and in place by the time the impacts begin to occur? This Policy and its IMS will not serve as mitigating and implementation measures for the RDEIR.</b>	I17-171
<b>AG-1.7 “Preservation of Agricultural Lands” (p. 3-5): Please clarify and strengthen this Policy to “promote” preservation of the County’s agricultural economic base and open space resources, and its Implementation Measures (pp. 3-9 and 3-10, #1, #6, and #7) so that they are clear, concrete, direct and enforceable, with measurable results and a definite timeframe (all the IMs are “ongoing”). “Promoting,” “taking the lead,” and “monitoring” have not yet provided a functioning, enforceable program to find, fund, and preserve such land through mitigation or other preservation programs. This Policy and its IMS will not serve as mitigating and implementation measures for the RDEIR.</b>	I17-172
<b>AG-1.8 (p. 3-5): This Policy has been changed from the 2008 version, which said, “If proposed within a UDB of an incorporated city, the County must receive consent of the affected city.” The 2010 version says, “. . . the County</b>	I17-173
Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR	37

shall give written notice to the affected city pursuant [to] Government Code Section 51233.” Please explain why the County has changed its stance and no longer requires the city’s consent. How does this provide for better planning and the protection of agriculture?

I17-173  
cont'd

IM#6 (p. 3-10) has also been changed from the 2008 version. It references RVLP Policy-1.1, which has also been significantly changed from the 2008 version (the new version allows development apparently anywhere in the RVLP area via highway corridors and New Towns, etc.). IM#6 additionally says [new] that the RVLP point total “shall be considered *along with other relevant information* to determine the establishment and expansion of UDBs.” What is the other relevant information, and how does it weigh in comparison with the RVLP point total? When is a Plan not a Plan? These changes continue the pattern in the 2010 GPU of reducing or eliminating constraints on the location of development in the County. Thus, the GPR’s Policies and IMs, already too often far too vague and weak to serve as mitigation and implementation measures, become increasingly tilted away from providing any mitigation and implementation at all for the RDEIR, and instead in many cases actively work against it.

I17-174

AG-1.10 “Extension of Infrastructure Into Agricultural Areas” (p. 3-5) and Implementation Measure #8 (p. 3-10): Extending urban infrastructure into areas designated for agriculture is a clear inducement to growth. The County changed its Policy wording from “discourage” to the stronger “oppose,” but then (in the IM) requests LAFCo only to “discourage” these infrastructure extensions; the timeline for requesting LAFCo action has been changed from 2010-2015 in the 2008 version to 2015-2020 in the current version. Making a request by 2020 will have little mitigating or implementing effect, and “discourage” is not an enforceable rule. This Policy and its IMS will not serve as mitigating and implementation measures for the RDEIR. Please change this timeline. How long does it take to ask LAFCo to do something??

I17-175

AG-1.11 “Agricultural Buffers” (p. 3-5): Please change from “shall examine the feasibility of” to “*shall ensure the establishment of agriculture buffers . . .*” Protective buffers for schools should be specifically included and emphasized in the buffers program.

I17-176

The buffer program could provide significant benefits to the health and safety of County residents. In addition to helping to “stabilize edge conditions, protect agricultural operations, and moderate untimely conversion of farmland,” (IM #9, p. 3-10), buffers could provide open space and recreational areas for walking and bicycling. Planted with native vegetation, they would also provide a bit of habitat, air cooling and cleaning, visual relief, beautification, and an opportunity for exercise away from motorized traffic. They could also provide groundwater recharge areas, natural stormwater management, and public health and safety benefits. A Policy that will only “examine feasibility” with an IM that will only “consider” implementation will not serve as mitigating and implementation measures for the RDEIR. The IM should include the public in the proposed stakeholder groups. The first bullet should restore the 2008 distance of 300’ (eliminated in the current version). The

I17-177

“implementation” targeted for 2010-2015 should be clarified: **Is this implementation of the stakeholder groups or of the Agricultural Buffer Program itself? The Agricultural Buffer Program should be a high priority, as it is important to many of the GPR’s stated Goals. Already the target date has been changed from 2007-2010 to 2010-2015. As the GPR notes (p. 1-11), “implementation can take time” and is subject to all kinds of limitations and other considerations. Given these disclaimers, what can the public rely on then, in the way of promised RDEIR mitigation and implementation?**

I17-177  
cont'd

**AG 1.12 “Ranchettes” (p. 3-6): This Policy is so vague as to be meaningless, and no IM is listed for it. The Matrix mentions (p. 105, #1) that two plans were developed in the County in the 1970’s for ranchettes in areas that are not built out yet. Where are those areas, what do the plans allow, and what is the areas’ remaining capacity?**

I17-178

The Matrix also refers to LU-3.5 (p. 5-17), which said in the 2008 version that the County “shall not *designate* any new rural residential development in the RVLP area” unless “other objectives, such as buffers” can be achieved. The current version has been changed to: “The County shall *not re-zone* any new areas” unless “other objectives, such as buffers *and the relationship of the development to surrounding uses*” can be achieved. **Why were these changes made? What’s the difference in meaning and intent between “designate” and “re-zone?” What is meant by “the relationship of the development to surrounding uses?” Please clarify and strengthen this weak Policy and provide it with a concrete Implementation Measure. Please define what the “other objectives” would be. Buffers will certainly not solve the problem of sprawl development in the RVLP. Neither AG-1.12 nor LU-3.5 has an IM. These Policies will not serve as mitigating and implementation measures for the RDEIR.**

I17-179

**Please change Policy AG-1.12 to: “The County shall prohibit the creation of any new Rural Residential Designations (ranchette developments), in order to use its developable land efficiently.”**

I17-180

**AG-1.13 #2 (p. 3-6) “Agricultural Related Uses”: Please correct to “The use *shall* not be sited . . . .” Also, in #5, “criteria” should be “criterion.”**

I17-181

**AG-1.16 “Schools in Agricultural Zones” (p. 3-7): Please change this Policy to “The County shall *strongly discourage* the location . . . .” (Thank you for including the information re GC Section 53094.) Schools should be located within the communities they serve so that their students can safely and conveniently walk and bike to school and readily participate in after-school activities.**

I17-182

**Locating new schools in agricultural zones not only exposes students more directly to health hazards such as dust and pesticide drift and overspray, but is also growth-inducing, increasing the pressure for further conversion of agricultural land to development.**

**No IM is shown for this “New” Policy other than #12 (p. 3-11), which is shown as ongoing, and indicates only that the County will indicate to school districts which infrastructure facilities and services require further analysis.**

I17-183

Please provide a stronger Implementation Measure to show how the County will work to discourage new schools in areas designated for agriculture. | 117-183  
cont'd

**AG-1.17 “Agricultural Water Resources” (p. 3-7):** Please clarify and strengthen this vague Policy and provide it with at least one concrete IM to enable measurement of its results; requirements for water conservation must be included and implemented; the ACFP must be included. The agricultural industry must play a major role in this protection and enhancement process. | 117-184

**AG-1.18 Farmland Trust and Funding Sources (RDEIR Table ES-3, p. ES-10, etc.):** This new Policy states that “The in-lieu fees collected by the County may be transferred to the Central Valley Farmland Trust or other qualifying entity, which will arrange the purchase of conservation easements. The County shall encourage the Trust or other qualifying entity to pursue a variety of funding sources (grants, donations, taxes, or other funds) to fund implementation of the ACEP.” Why is the Central Valley Farmland Trust designated here? This Trust operates in four counties (Sacramento, San Joaquin, Stanislaus, and Merced), none of which are even near Tulare County. Why isn’t Tulare County’s Sequoia Riverlands Trust designated? If the County does not transfer the in-lieu fees to some trust or other qualifying entity, what will happen to the fees, and how will they be used by the County? | 117-185

**AG-2 “Agriculture Productivity and Employment” (p. 3-7):** To “support increased viability of agricultur[al] production,” the County must include under this goal policies that will require its agricultural sector to become more resource efficient, in terms of conserving and reclaiming and reusing water, in terms of energy efficiency (as in AG-2.11), and in terms of reducing negative impacts on air, soil, and water, and reducing GHG emissions. For example, AG-2.1 should include a focus on drought-tolerant crops; AG-2.3 should assist higher-value crops only if they are not water-intensive; AG-2.4 should ensure that crop care education includes Best Management Practices (BMPs) for water-efficient irrigation, for soil conservation, for watershed and riparian area preservation, for minimizing applications and adverse impacts of applications of polluting chemicals, etc. | 117-186

Increased viability of agriculture must not be supported at the expense of the viability of our natural resources and the health, safety, and welfare of our residents. To achieve compliance with AB32 and with the County’s new Climate Action Plan, much will have to be done in the agricultural sector. The County should aim its policies toward achieving sustainable agriculture, the only way to achieve its long-term viability benefit to the County. | 117-187

All of the AG-2 Policies are too vague (“support,” “encourage,” “work to”) to serve as mitigating policies for the RDEIR, and none has an IM except AG-2.11 (which has IM#13 on p. 3-12, stating that the County is already amending the Zoning Ordinance to provide for agriculturally related energy production industries; please clarify what these changes are), so none of the others serves as an implementation measure for the RDEIR either. | 117-188

40

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

AG-2.5 (p. 3-7): What is meant by “accelerated development” of these industries? What would this entail?  
 AG-2.9 (p. 3-8): What criteria will demonstrate that Tulare County is a “premier location” for the production of globally-distributed products? Will these include our terrible air quality? Our water crisis? Our dreadfully high asthma rate? Tulare County should strive to attract clean, resource-efficient, responsible industry that could help to alleviate its 27% poverty rate while not adversely impacting its already deteriorating environment.

I17-188  
cont'd

AG-3 “Support the responsible development and economic viability of animal confinement facilities” (p. 4-6 in the 2008 version) has been eliminated from Chapter 3-Agriculture in the 2010 version, which now contains no mention of this tremendously important element of the County’s agriculture. Animal confinement facilities significantly impact not only the County’s economy, but also its air quality, water quality, soil quality, GHG emissions, and public health, safety, and welfare. The dairy industry is the single largest force in the County’s agricultural economy, but ACFs are completely minimized and made almost invisible in the GPU documents. Why does the GPR now make no mention of any Goal at all to support “responsible development,” and “economic viability” of these facilities?

I17-189

Why are no Policies or Implementation Measures provided in the GPR to clarify and implement such a goal? Page 12-1 of the GPR states that the ACFP contains policies and standards that address the location and development of dairies and other bovine animal confinement operations in Tulare County, but it provides no listing or summary of these policies and their implementation measures (if any). This is a serious deficiency in the GPR. Page 12-1 should also reference the Draft Supplemental Program Environmental Impact Report for the ACFP, which the County agreed to prepare in June, 2001, to settle CEQA litigation on the ACFP, and which is to “include a reasonable analysis and discussion of cumulative air quality impacts, groundwater quality impacts, and air quality impact mitigation measures” for the ACFP. Page 12-1 should also discuss the impact of ACFs on GHG emissions and refer the reader to the new Climate Action Plan for more information.

I17-190

**INADEQUATE BACKGROUND REPORT AND RDEIR EXISTING CONDITIONS AND BASELINE INFORMATION:**

I17-191

The Background Report (BR) discusses Dairy Production on pp. 4-21 – 4-23. The 2008 version (pp. 4-18 – 4-21) stated that in 2003 the County had 303 dairies and 358,000 dairy cows, per the University of California Agriculture and Natural Resources Department, with, as of 2004, 23 new dairies and 47 dairy expansions awaiting permit approval.

Please explain why the 2010 version switches its data source to the California Department of Food and Agriculture and the U.S. Department of Agriculture, It states (p. 4-21) a total of 332 dairies and over 481,000 dairy

cows in the county in 2007, with 124 applications for new or expanding dairy facilities pending in November of 2008 (85% of the applications for existing dairy expansions). <b>The BR information should be updated.</b> (As of July, 2007, the County was reporting <b>812,249 head, with 8,203,563,554 dairy wastewater gallons applied to cropland, and 1,233,320 tons of manure recycled and/or hauled offsite</b> , with the proviso that “the data is only as accurate as the information provided by the dairymen.”)	I17-191 cont'd
The BR mentions dairy issues that the 1992 Agricultural Advisory Committee addressed, including <b>lack of tracking of solid waste disposal; increasing herd sizes without obtaining a special use permit; and the fact that the County’s animal density standards in its 1974 Animal Waste Management Element were more permissive than the Regional Water Quality Control Board’s requirements.</b> It states that in 2000, Phase I of the Animal Confinement Facilities Plan was prepared, along with a program EIR that raised issues including <b>degradation of surface water, groundwater and air quality; land use conflicts; potential health hazards; and loss of natural habitat.</b> <b>The Background Report must be updated to discuss also the issue of ACFs’ contribution to GHG emissions.</b>	I17-192
<b>The Background Report</b> , which is supposed to provide “a detailed description of conditions in the planning area” provides no further information regarding these substantial impacts, merely mentioning that the County is currently preparing a Supplemental Program EIR to further examine cumulative air and water quality issues, and that Phase II of the ACFP will address animal confinement facilities for other types of animals. <b>Figure 4-2 “Existing Dairy Production” (dated 2000), BR p. 4-22, shows concentrations of dairies from the north end to the south end of the County’s valley floor, but does not state the number of dairies, nor their acreage, nor their herd size. This Figure must be updated (year 2000 data are not sufficiently current) and requires a textual explanation of number of dairies, acreage, herd sizes, and totals.</b>	I17-193  I17-194
The <b>RDEIR</b> provides almost no baseline information at all on <b>Animal Confinement Facilities</b> (e.g., dairies and feedlots). It provides <b>Table 3.3-5 on p. 3.3-20</b> (which was Table 4-2 on p. 4-50 in the 2008 DEIR), “Tulare County On-road Vehicle and Dairy/Feedlot Operational Emissions,” but provides no context to allow the reader to understand the magnitude or the significance of these emissions. It provides no information on ACFs’ impacts to water and soil and to GHGs. It does not address the impacts to the public’s health, safety, and welfare, or the County’s ability to comply with AB32 and with its new Climate Action Plan.	I17-195
<b>The Background Report and the RDEIR should discuss the following, to provide a useful baseline:</b> The County’s DSPEIR appears to have been circulated in October, 2006, but then what happened? Some of its proposed measures were included in the 2008 GPU DEIR (pp. 4-52 ff), AQ-4.6 and AQ-4.7), but not all of them, in the Air Quality and Global Climate Change section. <b>Why have these measures disappeared from the 2010 RDEIR?</b> (Even in the 2008 version, seven of the proposed measures were omitted.) <b>Where are the dairies’ impacts on groundwater discussed? What about their impacts on soil? Has the County studied and assessed the adverse impacts of dairy operations in the Chino Basin of California?</b> In the Chino Basin, dairies are being connected to the Orange County Sanitation District’s Regional Interceptor line in order to divert tons of biochemical	I17-196  42

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

oxygen demand, suspended solids, and dissolved solids from degrading the water quality of the underlying aquifer and the Santa Ana River. How much would a similar project cost Tulare County, to protect its aquifers from potentially devastating spills of manure-laden dairy waters?

I17-196  
cont'd

**Is there evidence that the measures being proposed in the ACFP and its DSPEIR will keep Tulare County from incurring the same environmental degradation and huge infrastructure costs that have plagued the Chino Basin area (which has far fewer milk cows than Tulare County)?** Is there evidence that these measures have been successful elsewhere, and, if so, to what degree? **The RDEIR should discuss mitigation measures such as the installation of methane digesters, the installation of solar systems or wind generators, and the incorporation of green building principles into the design and construction of ACFs to offset impacts.**

I17-197

**What are the policies and implementation measures that are allowing Tulare County to permit huge increases in the numbers of dairy cows, with the total projected to exceed 1,100,000 in the near future?** **Why is Tulare County projected to have well over twice as many dairy cows as any other county in the San Joaquin Valley, despite the adverse impacts to air and water quality and GHG emissions caused by dairy operations?** Of the 8 counties in the SJVAB, **Tulare County accounts for more than 30% of the total dairy AUs and more than 16% of total feedlot cattle (DSPEIR, p. 3-53).**

I17-198

**Why does Tulare County have only one inspector for its hundreds of dairies, so that they are inspected at most only once every five years?**

I17-199

## ANIMAL CONFINEMENT FACILITY AIR QUALITY IMPACTS:

**The following information, as a minimum, should be presented and discussed in the GPU documents (BR, RDEIR, and GPR, as appropriate) to provide the public and decision-makers with facts necessary to an understanding of this significantly impactful sector of the County's agricultural industry.**

I17-200

The SJVAB has been designated as nonattainment for the federal PM 2.5 standard and serious nonattainment for the 8-hour federal ozone standard. **Cumulative dairy emissions within the SJVAB will increase by 23%; a "substantial portion of the cumulative increase is because of the increased number of dairies in Tulare County" (DSPEIR p. 3-53).**

Tulare County is classified extreme non-attainment for ozone and severe non-attainment for federal PM10 and non-attainment with federal PM2.5 (the deadliest particles). Major contributing sources of PM10 emissions are (1) entrained roadway dust and (2) farming operations. **Dairies are major contributors in the roadway dust area and the farming operations area.**

**The ACFP/FPEIR (p.69) describes how 80,000 pound dairy milk tankers traveling on minor roads inadequate to the weight and frequent trips of these vehicles are degrading and destroying the County's rural roads at an accelerated rate. (See also BR p. 5-39 ff.) Since the County doesn't have the money to re-engineer and rebuild and maintain the roads for this type of traffic, the County will abandon the roads and no longer maintain them, so that they will go back to dirt, and rely on the dairies to keep down the mud and dust on the abandoned roads. How will this enable Tulare County to meet air quality goals?**

I17-201

43

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

“Dust (PM10), NOx and ROG emissions from any dairy project site would contribute to criteria pollutant emissions generated throughout the SJVAB. . . . “An increase in greenhouse gases, including methane, in the atmosphere is an international environmental issue” (DSPEIR p. 3-54). **How will adding 165,000 cows (above our 836,000 current dairy cows) help Tulare County to meet GHG goals?**

“Ammonia (NH3) is a strong alkali that is a severe eye, ear, and throat irritant. Ammonia reacts with nitrates and sulfates in the air to form ammonium nitrate that is a particulate less than or equal to 2.5 microns. It is a precursor of PM-2.5” (ACFP/FPEIR, p. 75). About 90% of ammonia emissions come from animal husbandry, with cattle and calves accounting for about 43%; there are additional ammonia emissions after the spreading of manure” (ACFP/FPEIR, p. 76). PM-2.5 is the deadliest of particulates. **How will this hugely increasing dairy industry impact the health of Tulare County residents?**

“Each new dairy or other animal confinement facility that is constructed in the county would contribute on an incremental basis to the generation of PM-10, ammonia (a precursor to PM-10), and ROG (a precursor to ozone). Because the San Joaquin Valley is designated as “non-attainment” for both PM-10 and ozone, any increase in emissions would further the non-attainment status” (*Ibid*). **How will these constantly increasing impacts to our air quality affect visibility and our tourist industry?** “Emissions of fugitive dust and gaseous air pollutants from dairy operations and non-dairy cattle feedlots are recognized to contribute a significant fraction of the total air pollutant emissions within the SJVAB” (SPDEIR, p. D-1).  
**“Dairy-related emissions within Tulare County are predicted to increase by roughly 38% in the future compared to existing [2004] rates”** (SPDEIR, p. D-5), and this is based just on proposed future dairies and dairy expansions at that time.

#### ANIMAL CONFINEMENT FACILITY WATER QUALITY IMPACTS:

The following information, as a minimum, should be presented and discussed in the GPR (in the Agriculture Element or in the Water Resources Element), and in the GPU RDEIR, which presently seems to deal only with domestic water and wastewater systems, like the Background Report).

When 51 wells were sampled at ACFs throughout Tulare County in 2001 and 2002, per the DSPEIR, sodium violated the human toxicity threshold in approximately 88% of the samples, the taste and odor threshold was violated in approximately 77% of the samples, nitrate levels exceed the California Primary Maximum Contaminant Level and California Public Health Goal for Drinking Water in 35% of the samples (and the sample wells do not represent the highest nitrate concentrations in Tulare County; when nitrate concentrations for the 51 wells plus Central Valley RWQCB monitoring wells were combined and averaged the average nitrate concentration for approximately half of the wells in both sets of data exceeded the EPA primary MCL, per

44

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

DSPEIR, p. F-6), total coliform was detected in 19.6% of the samples (and fecal coliform in one; the state has a health goal of zero total coliform because the presence of any coliform in drinking water causes a health risk), and the TDS (total dissolved solids) threshold was exceeded in about 12% of the samples (DSPEIR, p. 3-56).

I17-205  
cont'd

Wells up-gradient of dairies have the lowest nitrate concentrations, while wells down-gradient have the highest concentrations (DSPEIR, p. 3-57). The highest concentrations were generally found in wells located down-gradient of croplands (DSPEIR, p. F-8). Animal waste contains high levels of nitrogen compounds; nitrate is the most common form of nitrogen associated with runoff or seepage from dairies to groundwater, and it was detected at somewhat elevated concentrations in the dairies from which groundwater samples were taken. Nitrate can cause health problems to infants, children, and other groups.

Drinking well water containing total nitrogen exceeding the MCL value (35% of the sampled wells exceeded the MCL value for nitrates) can lead to methemoglobinemia ("blue baby syndrome"; hemoglobin is converted to the methemoglobin form in the circulatory system, which reduces the oxygen-distributing capacity of blood throughout the body) in infants, children, and sensitive individuals, and nitrate can form nitrosamine, a suspected human carcinogen; EPA also notes birth-defect potential. Nitrate is highly soluble in water and can often percolate freely through soil and into groundwater. Ammonia is often absorbed to soils and incorporated into soil complexes. Coliform and fecal coliform indicate bacterial contamination from waste from warm-blooded animals. Pathogens such as *E. coli*, hepatitis, and salmonella can cause very severe effects for all, but pose the greatest risk to infants, children, the elderly, and the ill. Salinity (measured as TDS or sodium, and exceeded in about 12% of the 51 wells sampled) poses a health risk to those on restricted-sodium diets, and is also detrimental to agriculture; it also violates drinking water thresholds associated with tastes and odors.

Tulare County is facing a water crisis. The County's burgeoning dairy industry has adverse impacts on the County's water quality and also uses tremendous amounts of water (at about 100 gallons per head per day times a projected dairy total of over a million head, that's a lot of water). What would be the effects on water quality of a major flood event in our ever-growing dairy area?

The GPR must include specific policies and concrete, measurable implementation measures to address these substantial impacts. The fact that the County inspects only about 1/5 of the dairies annually (and thus inspects a typical dairy only once every 5 years) bodes ill for timely monitoring and enforcement of policies and implementation measures, especially since the dairies have had a history of increasing their number of animals beyond their permitted limits. The GPU should address this weakness by increasing the frequency of inspections.

I17-206

Additionally, the GPU should include one or more policies with implementation measures and funding sources identified to carry out the Data Needs Assessment and Recommendations in the DSPEIR on pp. F-12 and F-

I17-207

45

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

13. These could be included in the Agriculture Element or in the Water Resources Element under WR-1.2 Groundwater Monitoring (GPR p. 11-3) (Implementation Measure #4 or #5 on GPR p. 11-7 might be a good spot). These recommendations include (1) comparing data from the U.S. Geological Survey National Water Information System database (~ 763 wells) and the California Department of Health Services database (~ 1479 public water supply wells) to provide a relationship between nitrate concentrations and well depth and help to define relationships between nitrate concentrations and the geochemical environment and sources, with time trends defined and nitrate inputs to groundwater defined over time, etc.; (2) looking at two GIS groundwater layers for depth-to-surface groundwater level and permeability or soil type to characterize permeability to groundwater, indicating which areas constitute risk if near a dairy and groundwater nitrate concentrations were elevated; (3) identifying areas more susceptible to groundwater contamination and incorporating them into ArcView /GIS/ArcInfo GRID to categorize susceptibility to contamination and identify potential hotspots; (4) allow for a cumulative risk assessment for nitrates and other pollutants; (5) evaluation of regional, county, state, and RWQCB regulations and EPA guidance on dairy discharge to groundwater to determine the best way to mitigate dairy discharges; (6) collection of demographic data relating to drinking behaviors of Tulare County residents to quantify exposures to nitrates or other chemical pollutants.

I17-207  
cont'd

It has been almost nine years since the County entered into the settlement agreement requiring the County to prepare, circulate for public review, and certify the completion of a SPEIR to the PEIR for the ACFP-Phase I. The County agreed to carry out these actions within nine months (or sooner) from the effective date of the agreement, which was executed in June, 2001 (with the proviso that the time limit could be extended "as is reasonably necessary"). How is nine years reasonable, given a commitment of nine months? In these nine years, how many more thousands of dairy cows have been added to the Tulare County dairy herds, with each cow producing daily 30 times the bodily waste that a human does?

I17-208

When the Water Board's own test data show that 63% of sampled valley dairies have at least one nitrate-polluted well, when 40% of sampled household wells in Tulare County contained unsafe amounts of nitrate, when more than 20% of the County's State-regulated public water systems failed the nitrate test, when students can't drink the water at their schools and residents have to buy bottled water for drinking (article in Sacramento *Bee*, 02/16/08, "suit pins bad water in Tulare on dairies"), Tulare County must address this growing problem with determination and dispatch. This General Plan Update process is the time and the place to do so.

I17-209

The RDEIR must thoroughly describe these impacts, direct and indirect, current and cumulative, and provide adequate mitigation measures for them. It is "vitally important that an EIR avoid minimizing the cumulative impact. Rather, it must reflect a conscientious effort to provide public agencies and the general public with adequate and relevant detailed information about them" (*Kings County Farm Bureau v. City of Hanford*, 1990).

I17-210

46

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

Please revise the GPU documents to adequately inform the public and decision-makers about ACFs and their increasing impacts, and to provide strong, clear, enforceable policies and implementation measures that will demonstrably mitigate these impacts and protect the County's air, water, and soil, and the health and safety of its citizens. (Please also explain why proposed policies [2008 version of the DEIR] AQ-4.6, 4.7, 4.8, and 4.9 have vanished in the 2010 version.) (AQ-4.6 has been added to the Air Quality Chapter in the GPR, but it has to do with Asbestos.)

I17-211

## 5. ECONOMIC DEVELOPMENT

To a large degree, Tulare County's economic development is tied to the County's demographics. GPR page 5-2 (fifth paragraph) notes that a "quality work force is one key requirement for selecting a site" and that "efforts to create a highly skilled workforce must be made to attract industry into the area to ensure a diversified and vibrant economy." However, the Background Report does not provide a sufficiently detailed description of the County's demographics to give the reader an adequate understanding of what this might entail.

I17-212

**INADEQUACY OF BACKGROUND REPORT, SECTION 2.5 "DEMOGRAPHIC CHARACTERISTICS"**  
(BR pp. 2-29 ff):

I17-213

Tulare County's economic development is intertwined with its demographics: its residents are its labor force and its consumers. Thank you for expanding the demographic information in the Background Report to cover more characteristics than simply age, gender, and ethnicity. It should also describe characteristics such as education, skills, income, employment, and health, which are all indicators of the current and potential economic success of the County. The 2010 BR now includes Table 2-25 "Educational Attainment . . . 1990-2006" (p. 2-39) and Table 2-26 "Income Distribution . . . 1999" (p. 2-39). Many of Tulare County's communities are characterized by high rates of poverty (including the highest rate of child poverty in the State), high rates of unemployment (often the highest in the State), low educational attainment (highest percentage of adults over age 25 without a high school diploma, only 12.4% with a bachelor's degree or higher, 20% with less than a ninth grade education), female-headed households (with by far the highest rate of teen pregnancy in the State), very high percentages of immigrants and of non-English speaking individuals, substandard and dilapidated housing, inadequate infrastructure, and poor access to health care. The Background Report should analyze the relationship between the County's demographics and its economy, and the GPU should provide specific policies and concrete implementation measures to address these issues.

What are the other key requirements (GPR, p. 5-2) for attracting firms looking for locations or seeking to expand, according to site location professionals? Are these criteria also being addressed in the GPU?

I17-214

Additionally, most of the Tables in the Market Conditions and Demographics section of the Background Report report on business and employment information ending with year 2000 data. Why aren't more current data presented?	I17-214 cont'd
The Policies listed for achieving the Economic Development Goals are still far too vague and weak ("provide leadership," "may allocate staff resources," "shall work with," "shall encourage," "shall support" [and occasionally "shall <i>actively</i> support"]), to provide clear direction and enable evaluation. <b>How</b> will the County "encourage" and "support?" Almost none of the Policies in this section have any Implementation Measures. Almost all of the ten IMs (GPR pp. 5-11 – 5-12) are equally vague, and all but three are "ongoing." <b>These Policies and Implementation Measures give the reader no clear idea of what the County is actually doing or intending to do to develop and diversify its economy and how and when it will implement measures to actually achieve its Goals. Please clarify and strengthen them to make them meaningful.</b>	I17-215
<b>ED-1.1 "Economic Leadership" (p. 5-2):</b> This Policy is too vague to be meaningful. <b>How</b> will the County "provide leadership?" Has it been providing this leadership for some time? What have the results been? Attracting "clean" industries should certainly be a priority. <b>How does the County define "clean?"</b> Presumably Freight Villages do not qualify in this category. There is no IM for this Policy. On the Tulare County Economic Development Corporation website ( <a href="http://www.sequoiavalley.com">www.sequoiavalley.com</a> ), Tulare County Business Incentive Zone information states "Whether your company is large or small, <i>lucrative Zone advantages</i> are available to new and existing businesses who are in Classification Codes (SIC): Food Processing, Manufacturing, Motor Freight Transportation and Warehousing, Transportation by Air, Transportation Service and Wholesale Trade." Which of these are the clean industries?	I17-216
<b>ED-1.2 "Staff Resources" (p. 5-2):</b> "May" is not a Policy statement.	I17-217
<b>ED-1.3 "Economic Strategy" (p. 5-2):</b> "Extend" should be "extent." Does the County currently have an Economic Development Strategy? Where is it? <b>IM#1 (p. 5-11)</b> says the County shall work with the EDC to update and adopt a strategy that supports the economic goals and policies of the General Plan. This seems to be more or less a re-wording of the vague Policy itself, with a timeline of 2015-2020. So what is the County doing in the meantime to reach its Economic Development Goals?	I17-218
<b>ED-1.4 "Local and Regional Coordination" (p. 5-3)</b> says the County shall work with other agencies to develop a resource allocation program, including a Countywide capital improvement plan (apparently recommended in 2005). <b>IM#2 (p. 5-11)</b> says the County shall coordinate a committee to develop a resource allocation program, with a timeline of 2010-2015. The IM simply restates the Policy and moves the action timeline farther down the road. Neither the Policy nor the IM can be relied on to accomplish anything.	I17-219

The Policies and IMs (where there are any) continue in this vein.

117-220

**ED-2.3 “New Industries” (p. 5-4):** New industries, along with all other development, should be located within existing cities, UDBs, and HDBs. We need compact, resource-efficient, transit-served development and jobs co-located with population, infrastructure, and services in order to meet the key goals of improving air quality, conserving agricultural land and open space, reducing VMTs and GHGs, and complying with AB32, SB375 and the County’s Climate Action Plan. (See also ED-2.8 “Jobs/Housing Ratio” and ED-2.9 “Regional Processing,” p. 5-4), which promote a jobs-to-housing ratio of greater than one and “encourage” processing facilities to locate in industrial parks within existing unincorporated communities or under city jurisdiction.).

117-221

**Please modify this Policy** to say that “*New industries shall be located within cities, unincorporated communities, and hamlets where appropriately zoned and where adequate infrastructure capacity is available or can be made available as a condition of approval of the development.*” What is meant by “opportunities offered by variations in local environmental conditions?” In determining location, jobs/housing ratio, transportation, VMTs, GHGs, and cost to the taxpayers must be considered (do the costs of some industries outweigh their benefits?).

**IM#4 (p. 5-11)** says the “County shall develop criteria for the *location of value-added agricultural processing facilities.*” What about other industries? It says the criteria “shall take into account the service requirements of facilities . . . and the capability and capacity of the cities to provide the services required.” What about the new industries to be located in the unincorporated areas? Are the cities expected to provide services to them?

117-222

**ED-2.10 “Supporting Agricultural Industry” (p. 5-4):** What are other “critical requirements of food processing industries, such as wastewater treatment” that “may require innovative solutions?” What is meant by innovative, and why is this necessary? How will the County “support” and “encourage” technology development programs “for use by industries to support expansion?” Tulare County’s water supply is in crisis, per the Board of Supervisors. Effective wastewater treatment is essential to maintaining water quality and water supply. **IM#4 and #5 (p. 5-11)** say nothing about innovative solutions to wastewater treatment or other critical requirements, mentioning only that “service requirements” will be taken into account (and “capability and capacity of the cities to provide”) and that the County will work with others to create agricultural enterprise zones with incentives. **Where does the RDEIR specifically discuss the environmental impacts of the Economic Development Chapter?**

117-223

**ED-2.11 “Industrial Parks” (p. 5-4):** Is the “projected demand” on the part of the County, the community, or the industrial developer? Is industrial development considered appropriate for all the communities? Three Rivers, for example, is constrained in many ways from siting any significant industrial development at all.

117-224

**ED-2.12 “Intermodal Freight Connections” (p. 5-4):** Encouraging the development of freight handling facilities encourages the concentration of idling toxic diesel exhaust emitting vehicles, highly detrimental to air quality and

117-225

49

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

the health of residents. PM 2.5 particulate matter associated with diesel engine exhaust is a substantial health concern. **Tulare County's air quality is already often the worst in the nation.** Diesel soot already causes about 3,000 premature deaths a year in California, about 3600 hospital emission, and about 240,000 asthma attacks and respiratory symptoms. Diesel exhaust particulate matter is identified by California as a toxic air contaminant based on its potential to cause cancer, premature death and other health problems. Diesel engines also contribute to PM2.5 air quality problems, to which children (34% of Tulare County's population) and the elderly (13%, as of year 2000, per the Background Report) are most vulnerable (not to mention those with pulmonary and cardiovascular problems). Our bad air already costs us dearly in human misery, truncated lives, lost productivity, missed school days, emergency room visits, and long-term health care expense. This is not to mention the impact on GHG emissions. **The County should very carefully assess the short- and long-term cost/benefit ratio of supporting "the creation and enhancement of intermodal connections" for freight handling.**

I17-225  
cont'd

**Please add related policies and implementation measures to require that, as a minimum, any such facilities must strictly limit idling of diesel vehicles to five minutes maximum, prominently post signage to restrict diesel idling and to educate drivers re diesel health impacts, and install on-site electrical connections and require drivers using the facilities to use these connections to power their heating and air conditioning and refrigeration units instead of operating diesel engines and diesel refrigeration units.** Please condition approval of any such development upon strict implementation and enforcement of these requirements as a minimum. Substantial buffer zones must be provided without exception around such facilities to screen them from sensitive receptors (as well as visually), and the buffers must be thickly planted (and well-maintained) with carbon-absorbing large-canopy trees and other vegetation. There is currently no IM for this Policy.

**The County must ensure that the potentially favorable impacts of industrial and other economic development are fully weighed against their adverse impacts to the environment and the health, safety, and welfare of County residents – and the related costs . The impacts on global climate change must also be factored in. This comment applies to all of the Economic Development Goals, Policies, and Implementation Measures.**

**ED-3.3 "Non Agricultural Industries" (p. 3-5): Please ensure that the County does NOT "encourage the development and expansion of food crop ethanol production,"** because the process of growing food crops and then producing ethanol from them takes more fossil-fuel energy input than is gained in energy output; furthermore, using food crops for ethanol drives up food prices.  
**Please encourage only "non-food stock based" ethanol production.**

I17-226

**ED-3.7 "Attractive Economy" (p. 5-5):** Enhancing cultural and recreational amenities is a fine Policy not only for attracting business entrepreneurs and employees, but also to improve quality of life for current residents. But how will the County "support" such efforts? And what are the efforts? There is no IM for this Policy. The Background

I17-227

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

Report states that the County is not considering any more parks because it can't afford to maintain the few that it has. | 117-227  
Will entrepreneurs and employees be readily attracted to a County with often the worst air quality in the nation? | cont'd

**ED-3.10 "Specialty Business Program" (p. 5-6):** This is the only Policy in ED-3 with an IM. What are | 117-228  
"specialty" businesses and "ethnically diverse enterprises?" IM#6 (p. 5-11) says the County will continue to  
provide seed funding and training through the Micro Enterprise Program, the Small Business Development Program,  
and similar programs.

**ED-4.2 "Workforce Education" (p. 5-6):** This Policy encourages school districts to "focus on the requirements of | 117-229  
those industries targeted for future growth." **Who targets the industries for future growth, and on what basis?**  
In a rapidly changing economy, it's important for students to learn how to learn and to adapt to changing skill  
requirements and technologies.

**ED-5.1 "Development of a Recreation Industry" (p. 5-7):** The County must recognize that protecting and | 117-230  
conserving the County's rural character, natural resources, scenic landscapes, wildlife habitat, and  
community identity and character are essential to capitalizing on the economic potential of recreation as a  
major industry. Additionally, cleaner air is critical, both for outdoor recreation and scenic views. Getting  
official designation of State and County scenic highways and byways should be a key focus. Providing  
adequate public transit, parks, and walking and biking trails is also very important to this Policy. Its only  
IMs are #8 and #9, (p. 5-12), developing marketing programs and evaluating allocating TOT revenues to tourism  
program. Tourism should be encouraged as a sustainable, less environmentally adverse area of economic  
development, that would cost the County little to support, since it relies on advantages that we already have.  
However, those advantages will soon be lost (except for the Federal lands) if the County does not require compact,  
resource-efficient, carefully-located, form-based development.

**ED-5.5 "Rivers" (p.3-5):** The County's critically endangered riparian areas are almost our rarest resources, and yet | 117-231  
are vital to the quality of life in our County. They can be wonderful tourist attractions, and are even more important  
to valley citizens, who have few other natural areas close by for refreshment and recreation; our rivers are also  
absolutely critical wildlife and plant habitat.

**This policy should strictly limit recreational activities to only those that are compatible with the protection  
and preservation of our rare and endangered rivers. Please provide a concrete, measurable implementation  
measure for this policy.** (For example: NO motorized vehicles allowed, and no vehicles at all in the riverbed or  
near enough to the banks to promote or create erosion or disruption of vegetation.) Walking and biking trails,  
wildlife watching areas, picnic spots, interpretive signage, and River Rover docents could provide for fine

recreational and educational experiences. Unfortunately, few of our rivers flow much below the dams during much of the year. | I17-231  
cont'd

**ED-5.6 “Lakes” (p. 3-5):** With a grand total of two readily accessible lakes of any size in the entire County, the County should, as in the case of its three rivers, make a major and continuing effort to ensure the protection of the recreational quality of these resources, and should pledge its efforts to do so in this policy which urges their exploitation. How does the County mean to promote these lakes (there is no implementation measure)? It should also be noted that these lakes hugely expand and contract each year, as their water goes out for irrigation, so golf courses and conference/hotel facilities cannot readily be located adjacent to them. Lake Kaweah is bordered by steep slopes not suitable for any type of large development. | I17-232

**ED-5.9 “Bikeways” (p. 5-7):** Please clarify this welcome Policy and provide it with a concrete, measurable implementation measure. Section 13.5 (“Other Transportation Modes,” p. 13-11) includes a number of related policies, also very welcome, also very vague (“coordinate,” “consider incorporating,” “evaluate feasibility,” “identify routes,” “support”) and generally equally vague Implementation Measures (pp. 13-15 – 13-16). Please make these policies clear and enforceable and provide concrete, measurable IMs for them. Where are the County’s current recreational bikeways? How many miles are completed for safe cycling travel? How are they marked? How will they be enhanced and promoted? | I17-233

**ED-6 (p. 5-8):** Note that this Goal now repeats the text of Goal ED-5 on p. 5-7. In the 2008 version, ED-6 said, “Address regional and local commercial needs by continuing to support downtowns, town centers, and neighborhood services.” | I17-234

**ED-6.1, ED-6.2, and ED-6.3 “Address regional and local commercial needs by . . .” (p. 5-8):** Providing access to community centers and regional entertainment venues by means of public transit (and walkways and bikeways where distance allows) is an especially important component of any plans for revitalization and redevelopment and for attractions designed to draw large crowds, particularly given Tulare County’s air quality problems, public health problems, and necessity of complying with AB32, SB75, the Blueprint, and the County’s Climate Action Plan. All these policies should emphasize alternate transit. Please make these and the other policies in this important section clear and enforceable, and provide concrete, measureable IMs for them and for the related policies under TC 13.4 (“Public Transportation,” p. 13-10) and TC 13.5 (“Other Transportation Modes,” pp.13-11). | I17-235

**ED 6.6 “Core Area Beautification” (p. 5-8):** Please revise to make a primary component of this policy be the planting and maintenance of abundant large-canopy trees (preferably natives and drought-tolerant) in these core areas to provide shade and beauty, to cool and clean the air, to provide habitat, and to attract pedestrian | I17-236

traffic and customers; extensive tree planting should be included in the Implementation Measure (#10, p. 5-12). This might also aid the County in attaining compliance with AB32 and its Climate Action Plan. This Policy is listed as “New,” yet its Implementation Measure is shown as “Ongoing.” **Please revise the IM to indicate the source of funding for the beautification efforts. Landscaped groundwater recharge areas with recreation areas, trails, and community gardens could be good projects for the health and beautification of communities, and these could also attract tourists, while aiding water quality and supply.**

**None of the other Policies in this section have any IMs at all.**

117-236  
cont'd

#### 4. LAND USE

At the top of the first page (p. 4-1), “implementation programs” (2008 version) has been changed to “Work Plan/Implementation Measures.” It appears that programs are being retrograded to plans, and thus actual implementation is becoming a more remote possibility. **Please explain the intent of this change.**

117-237

Under “Key Terms,” the “LEED-ND” item (p. 4-2) should be updated to show that the LEED-ND rating system has been launched (April, 2010).

117-238

Under “Key Terms,” the “Sprawl” item (p. 4-3) should discuss whether the growth rate of urbanized land in Tulare County has been significantly exceeding the rate of population growth and whether it will do so during the 2030 project buildout.

117-239

Under “Key Terms,” item “Land Use Diagram and Standards” (p. 4-3) and “Residential Development” (p. 4-4), it would be very helpful if the related Figures and text would show the current distribution and acreage and units of the residential uses and densities and how this would change by the implementation of the full 2030 project buildout. To see the nature and impact of the project in a comparative Table and Figure(s) would give the reader a much clearer idea of the Plan. **Please include such a Table and Figure(s) in the GPU documents. Please provide sufficient detail in it (as indicated in comments directly below on the current Figure 5.1) to enable the reader to understand where these Land Use Designations occur. It would be helpful to see where these designations are currently located (as a baseline) and where they would be located at build-out of the proposed project (GP), so please provide two maps (baseline and build-out) if possible. Please include the two Land Use Diagram maps (baseline and build-out) in detail for each of the County’s Planning Areas, as depicted in Figure 4.1 (p. 4-5). It would be helpful to place them with the discussion of their Planning Areas (e.g., place the maps for Foothill Planning Area – the FGMP in Part II, Chapter 3, Foothill Growth Management Plan, perhaps immediately following the current Figure 3.1 on p. 3-16; the maps for the Foothill Development Corridors are helpful, but there is no information regarding their size and current uses, etc., and no baseline/buildout comparisons).**

117-240

**Table 4.1-Land Use Designations, Rural Residential (p. 4-7):** In the 2008 version, this land use was 1 unit/5-10 Acres. **Why has it been changed to 1 Unit/1 or 10 Acres? Won’t allowing 1 unit per acre more severely**

117-241

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

53

fragment natural lands, and further increase erosion, stormwater runoff and pollution, loss of habitat, degradation of scenic landscapes, light and glare impacts, GHG emissions, VMTs, air pollution, cost of services, and other adverse impacts? How much Rural Residential land use does the County already have? How much more can it afford?	I17-241 cont'd
<b>Table 4.1-Land Use Designations, Mountain Residential (p. 4-7):</b> This land use was 1-4 du/Acre in 2008, but has been changed to 1 Unit/1 Additional Unit for every 40 Acres. <b>Why has this drastic change been made?</b>	I17-242
<b>Table 4.1-Land Use, Residential Density (Low to High), p. 4-7):</b> Why have these been changed from the 2008 version? <b>Of most concern is that the County now defines High Density Residential as beginning at only 14 du/Acre.</b> Also, why is there so much overlap between the categories (e.g., Low Density is 1-4, Low-Medium is 1-8)? Why doesn't Low-Medium Density start with a minimum of 5? Furthermore, <b>these densities don't correspond well at all with the CO2 Equivalent Point Reduction requirements in the County's Climate Action Plan (CAP).</b> On p. 245 of Appendix C of the CAP, a minimum of 7 (7-10) du/acre is required for a 1 point reduction. This doesn't correspond to any bracket on the Land Use Designations densities in Table 4.1. To get 3 points, per the CAP, 11-20 du/acre would be required, which would match most closely to Medium-High Density on Table 4.1. To get 5 points, 21-30 du/acre would be required, which constitutes High Density Residential on Table 4.1, the highest density designated for Tulare County land use. But the CAP chart goes on to list 31-40 du/acre for 6 points, 41-50 du/acre for 8 points, and 50+ du/acre for 10 points. <b>Given the importance of increasing the efficiency of developed land use in Tulare County in order to achieve the Goals of the GPU, the County should revise the density designations in Table 4.1 to reflect higher thresholds (except for Low Density) and no significant overlap for the different density categories.</b>	I17-243
<b>Table 4.1 Land Use Designations, Mixed Use (p. 4-8):</b> The 2008 version showed that Hamlet Mixed Use would be 1 – 30 du/acre. <b>Is this to be understood to be the same in the 2010 version?</b>	I17-244
<b>Valley Agriculture (VA) (p. 4-15):</b> This definition has deleted the 2008 sentence "The RVLP applies to all lands designated Valley Agriculture." It has added the sentences: "The following standards apply to all parcels designated as valley agriculture except those parcels deemed non-viable in accordance with the procedures set forth in Part II-Chapter 1 (RVLP). Maximum density, intensity, and parcel size for non-viable parcels is determined in accordance with the procedures set forth in Part II-Chapter 1 (RVLP)." <b>How many acres is this likely to affect? How does this further the Goal to protect agricultural and open space lands?</b>	I17-245
<b>Rural Residential (RR) (p. 4-17):</b> Why has the Maximum Density for this use been changed from 1 du/5 acres in the 2008 version to 1 du/1 acre in the 2010 version? <b>What will the environmental impacts of such a change be? Where is this discussed in the RDEIR?</b> This designation seems to define ranchettes, an extremely inefficient use of land that should be strictly minimized. The last sentence of this definition implies that the RR is primarily	I17-246

located at the edges of UDBs. **Please clarify:** Is this inside the edges or outside of the UDBs? All new development should be directed to occur within existing UDBs and HDBs

117-246  
cont'd

**Mountain Residential (MR) (p. 4-17):** The last sentence of this definition in 2008 read, "This designation is generally found outside UDBs in the upper foothill and mountain regions." This has been changed in 2010: "This designation is generally found in Mountain Sub-Area Plans." **Since the first sentence still includes "foothill" and "steep slopes and limited services" are often the case in the foothill area, "foothill" should be restored to the last sentence of the 2010 definition.** The Maximum Density has also been changed. It was "4 DU/Acre" in the 2008 version. It is "1 Dwelling Unit/20,000 square feet plus 1 additional Unit for each 40 Acres." **Please explain why this change has been made and what its environmental impact is likely to be.**

117-247

**Low-Medium Density Residential (LMDR) (p. 4-17):** The bottom of this designation's Maximum Density range was 3.5 du/acre in 2008. It has been changed to 1 du/acre, which makes no sense, as that is the base for the Low Density designation. **To make this designation meaningful, please return the base du/acre to 3.5.**

117-248

**Medium Density Residential (MDR) (p. 4-17):** The bottom of this designation's Maximum Density range was 6.1 du/acre in 2008. It has been changed to 4 du/acre in the 2010 version, which seems too low to qualify for Medium Density. **Why was this change made, when the County should be promoting greater land use efficiency to meet many of the Goals of the GPU? Please return this base figure to at least 6 du/acre.**

117-249

**High Density Residential (HDR) (p. 4-18):** Why has the base figure for this designation been lowered from 16.1 in the 2008 version to 14 in the current version? How does this promote greater land use efficiency? **Please return this base figure to at least 16 du/acre. As discussed above, this designation for HDR falls far short of the densities described in the County's Climate Action Plan (p. 246/C-11) that would qualify for significant CO2 Equivalent Point Reductions. The County should include at least one higher category of densities (e.g., 31-40) and incentivize such development in order to address its GHG emissions and other important Goals.**

117-250

**The Commercial designations (NC, GC, CC, HC, TC, SC, OC, pp. 4-18 – 4-19), with the exception of Commercial Recreation (p. 4-19) should all be located within UDBs only.** To comply with AB32, SB375, the Climate Action Plan, and many of the Goals of the GPU (e.g., preservation of agricultural and open space lands and scenic landscapes, establishment of buffers and separators, maintenance of community identity, investment and reinvestment in existing communities, maintaining urban edges, benefiting resident" quality of life, improved air quality, facilitation of active and alternative transit, etc.), **the County must focus growth and development within existing urbanized areas, especially since they can easily accommodate all of the projected growth without even increasing densities.**

117-251

Please change the last sentence of this Key Term definition to: “This designation is located within UDBs and HDBs.” | 117-252

**Mixed Use (MU) (p. 4-20):** It is good to see the new sentence in this definition: “Density bonuses for residential units of 25% to 35% may be granted, according to the Density Bonus Ordinance or State law, to Mixed Use areas to encourage the development of affordable housing units, transit, reduction of air impacts, and implementation of measures that contribute to the reduction of global warming”. The regional growth corridor policies, of course, work completely against the benefits that could be afforded by effective MU development within existing boundaries.

To ensure a high quality, well balanced, efficient development that will protect and enhance the character of the area, please modify the last two sentences in this Key Term definition as follows: “Specific plans *shall* be required to assist in the consideration . . . . This designation is found within UDBs and HDBs.” Please see “Commercial” comments above for rationale on eliminating regional growth corridor plans.

**How was the Maximum Intensity of .5 FAR determined, and what would be the effect of increasing it, in terms of achieving the goals in this definition?** | 117-253

**Foothill Mixed Use (FMU) (p. 4-20):** Same comments as for MU directly above. | 117-254

**Planned Community Area (PCA) (p. 4-20):** There are thousands of acres without community plans in the unincorporated County now designated for urbanization (communities without plans, hamlets, mountain service centers). In order to achieve the GPU’s Goals, and the requirements of the RDEIR and the Climate Action Plan, AB32, and SB375, PCAs should be located within these boundaries only, and ALL development in the County should ensure provision of open space, infrastructure, and public services needed to support growth. The definition of a PCA is not complete without a definition of “exceptional quality of life”; please include it. Certainly that cannot be achieved unless we can significantly improve our air quality and effectively address our water crisis, our lack of affordable housing, the impacts of global climate change, and the need to diversify our economy, along with the other important Goals of the GPU. Please explain here the difference between a PCA and a Planned Community Zone. Why should master planning for a planned community occur only where a community plan does not exist? | 117-255

**Light Industrial (LI) (p. 4-21):** For the reasons cited above, please change the last sentence of this definition to eliminate the regional growth corridors: “This designation is found within UDBs and HDBs.” | 117-256

**Heavy Industrial (HI) (p. 4-21):** Same as above comments. HI designation should include requirement of buffers, with lots of trees (especially native trees to help mitigate noise, odor, and visual impacts. | 117-257

**Public/Quasi-Public (P/QP) (p. 5-12): Churches, schools, civic centers, hospitals, fire stations, sheriff stations, and other P/QP services/facilities that are used daily by large numbers of people should be constructed where the large numbers of people already are, NOT out in a regional growth corridor.** | 117-258

PLEASE walk the talk: direct growth to existing communities, discourage sprawl, encourage infill, preserve open space, per LU-1.1.

**INADEQUACY AND INCONSISTENCY OF TEXT AND TABLES IN RELATED BACKGROUND REPORT INFORMATION AND INADEQUACIES IN THE RDEIR:** | 117-259

The Background Report section on Land Use and Population contains text and tables related to Land Use Designations and population growth, but the information is inconsistent, incomplete, and confusing. | 117-260

**Please revise this section of the BR to make it clear and consistent and provide maps to make clear the baseline situation and what is proposed under the GPU build-out.** In our comments over two years ago, we asked for clarification and corrections in this area, but they have not been provided in the 2010 version

For example, **Table 3-6 “Summary of Community Plans, Tulare County 2006,” BR p. 3-33,** shows for each of the eleven community plan areas “Total Plan Area (Acres),” “Vacant Land (Acres),” and “Projected Planning Period Land Need (Acres).” | 117-261

**Please explain: What is the Projected Planning Period Land Need?** Is it the amount of land needed by the time horizon of the GPU build-out? Is it the same year for all of the communities listed, or is it some year defined in their individual plans?

**If the Projected Planning Period Land Need Acres are less than the Vacant Land Acres,** does that mean that all the land needed throughout the Planning Period is already available in the vacant acres? | 117-262

**Why are Springville and Richgrove NA?** If more land is needed than the vacant land indicated, then what? | 117-263

**What is meant by Existing Plan Population? In the 2008 version of the BR the figures in the Community Plan Table did not match any of those in Table 2-26 “Tulare County Population Projection, 2000-2025,” (BR p. 2-42).** | 117-264

Unfortunately, in the 2010 BR, **Table 2-26 no longer exists.** The closest the 2010 BR gets is **Table 2-16, Tulare County Population Growth Projections, 2007-2030 (p. 2-31).** However, this Table does NOT include any information for the individual communities (whereas Table 2-26 in 2008 included individual information for almost all the communities with community plans). **Please revise Table 2-16 (p. 2-31) to include this important population information for all of the communities; without the population information, the information in Table 3-6 (p. 3-33) cannot be meaningfully evaluated.** | 117-265

**What year is meant by the Projected Population (Target Year) column in Table 3-6?** Is this the same year for each of the communities? **These figures** have no correspondence with those on Table 2-16. | 117-266

Additionally, when one looks at the **figures for population and for acreage in the text** for each community (BR pp. 3-33 - 3-43), **these figures do not match the figures in the Tables.** The population figures never match, and sometimes the acreage figures don't match. **Please explain and normalize these figures.**

I17-267

**How are the population projections related to the communities' ability to provide for projected population (e.g., do they have, or do they have a reasonable certainty of being able to provide, the necessary water supplies, sewer capacity, and other infrastructure, jobs, and other services required to accommodate the projected population?**

I17-268

The Background Report states on p. 3-61 that the General Plan **land use designations and the development standards** of the zoning ordinance determine the **holding capacity** and buildout potential of the county. But **don't the County's essential resources, such as water supply, soil and geographical conditions, and air quality, have a great deal to do with determining the holding capacity and buildout potential also?**

I17-269

**Where in the GPU documents is this connection spelled out and examined?** Only Appendix C of the Background Report begins to get into this fundamental relationship, when it states (p. C-22) that **water supply considerations could "completely undermine the existing population projection basis."** The GPU documents **must be revised to examine and address these basic factors when designating land uses and allocating population growth. This should include consideration of the proposed project's effect on GHG emissions and the effects of global climate change on the holding/carrying capacity/buildout potential of the County.**

I17-270

In a similar vein, the RDEIR really seemed to have it backwards when it stated in the 2008 version (pp. 2-7 and 2-8) that the GPU is a policy plan that "relies on individual policies to direct growth to preferred locations **in response to market forces.**" Why isn't the GPU a plan that **relies on a clear vision of its priorities for the County's future to determine policies that direct growth to preferred locations so that market forces will know where they can build houses, stores, office space, manufacturing plants, etc.?** Please explain: Why would the County abdicate its planning role to the quick-buck, short-term whims of market forces? How could that be in the best interest of a healthy, sustainable future? **In response, the 2010 version (RDEIR pp. 2-24 – 2-25) has eliminated the statements about market forces,** other than to state (p. 2-25) that "Major infrastructure investments by the public and private sectors are a necessary precursor to enable growth in the County." It states (p. 2-25) that "Guidance for directing this growth will be provided by the various policies and implementation measures outlined in the General Plan Update, in particular those found in the Planning Framework and Land Use Elements." However, as is shown repeatedly in these comments, **the GPU's Policies and Implementation Measures in most cases cannot be relied on to get the County to achieve its Goals, nor can they be relied on to provide the mitigation and implementation required by the RDEIR.** Thus it appears that market forces, although no longer acknowledged as such, will continue to be the drivers of growth and development in the County, to the detriment of creating healthy and sustainable development for its current and future residents.

I17-271

**Figure 4-1 “Tulare County Planning Areas” (GPR p. 5-4):** Thank you for including the hamlet names on this map, along with identified roads and other indicators to enable the reader to understand where these Planning Areas are **and for labeling the large Planning Areas** (e.g., Kennedy Meadows Plan, Great Western Divide North Half Plan, etc.) with their names so that they can be readily identified.. Again, **please also include the acreage** of each of the Planning Areas. | 117-272

**Table 4.1 “Land Use Designations” (GPR p. 4-7 ff):** In our 2008 comments, we asked: **“Please explain:** Why is the Resource Conservation land use designation allowed for communities and other unincorporated areas, but not for hamlets? Why is the Urban Reserve designation allowed for city UDBs and communities, but not for hamlets? Why are no Residential Designations (Low-Density Residential, Low-Medium-Density, Medium-Density, Medium-High-Density, and High-Density) allowed in hamlets, and no Commercial Land Use Designations? Why are Highway Commercial, Service Commercial, and Recreation Commercial allowed in cities, communities, and unincorporated areas, but not in hamlets? Why is Light Industrial allowed in communities and hamlets, but not in cities or unincorporated areas (while Heavy Industrial is allowed in all areas)? How do these designations (or non-designations) impact hamlets’ opportunities for development?” Table 4.1 has been extensively revised in the 2010 version and now **shows no information for the cities, but does show all of these uses for the hamlets** and also identifies them for particular plans (e.g., Regional Corridor, FGMP) in the “Other Incorporated” column. Thank you for making this Table more serviceable. | 117-273

**LU-1(GPR p. 4-22)** states that the County will “encourage . . . highly efficient land use.” **This low level of commitment, clarity, specificity, and determination seems highly unlikely to produce the level of resource-efficient development that the County needs to achieve comprehensively in the very near future.** Since almost all of the supporting Policies are equally vague (“promote,” discourage,” “support,” “encourage”) and their IMs equally ineffective (“shall consider,” “shall develop criteria”), or only minimally related to the Goal or Policies, they will not suffice to achieve highly efficient land use nor to meet the requirements of mitigation and implementation in the RDEIR, nor to comply with AB32, SB375, the goals of the County’s Climate Action Plan, and the people’s priorities. Throughout the Land Use Chapter, this applies. | 117-274

**LU-1.1 Smart Growth and Healthy Communities (p. 4-22):** This policy includes a good list of principles, but it **must be clarified and strengthened** beyond “promote” to truly put them into practice. **Please revise this policy accordingly.** How will the County “promote” these principles into practice? And what about in the areas that are not UDBs and HDBs that are proposed for development?  
**The IMs corresponding to this Policy (#2, #3, #4 on p. 4-33) must be made concrete, direct, and enforceable so as to provide measurable certainty of achievement.** | 117-275

**IM #2** says that the County shall prepare Land Development Regulations addressing a number of areas applicable to land development. Does the County not presently have such regulations regarding land | 117-276

development? If such regulations exist, what is the purpose of this IM? How, specifically, will it ensure smart growth and healthy communities? The timeline for this IM is 2007-2010. It's 2010 now. Are these Land Development Regulations complete? Can they be viewed online? Presumably "street <i>scraping</i> " should be "street <i>scaping</i> ." How do the examples listed contribute directly to highly efficient land use?	117-276 cont'd
IM #3 says that the County shall "consider" appropriate incentives to encourage smart growth. "Considering" is NOT implementing. What would these "appropriate" incentives be? Are they already being utilized? The incentives should be tiered to urge developers to achieve maximum adherence to responsible growth principles and practices in their projects; development proposals that do not reflect a serious good faith effort to achieve these goals should be rejected. The timeline for this IM is 2007-2010. It's 2010 now. Are these Land Development Regulations and Zoning Ordinance revisions complete? Can they be viewed online?	117-277
IM #4 says that its implementation is ongoing, which indicates that the County has been ensuring that smart growth principles are incorporated as conditions of project approval, "as appropriate." Where are the results of this "ongoing" implementation of smart growth development that can be visited in Tulare County? How can the public track the County's progress in implementing responsible growth policies and principles? What, specifically, are these principles that are being implemented and what determines "appropriate?"	117-278
LU-1.2 "Innovative Development" (p. 4-22): Please clarify and strengthen this vague Policy and provide it with a concrete Implementation Measure. What types of "flexibility" and "innovation" will this Policy "promote?" Please see comments above on IM#3.	117-279
LU-1.3 "Prevent Incompatible Uses" (p. 4-22), IM#1 (p. 4-33): The timeline for this IM is 2007-2010. It's 2010 now. Are these Zoning Ordinance updates complete? Can they be viewed online? Didn't the County already have Ordinances designed to prevent incompatible uses?	117-280
LU-1.4 "Compact Development" (p.4-22): This policy could play a major role in helping the County to comply with AB32, SB375, the County's Climate Action Plan, and the people's priorities, but "actively support" is too vague to be meaningful, and the corresponding IM, #3 on p. 5-22, says only that the County shall "consider" incentives to encourage smart growth. Please make the Policy and its IM clear, concrete, and enforceable.	117-281

LU-1.8 “Encourage Infill Development” (p. 5-13): This important (but vague: “encourage,” “provide [unspecified] incentives”) Policy is to be implemented by IMs #3 (discussed above), #7 (p. 4-33), and #8, #9, and #10 (p. 4-34). | 117-282

IM#6 calls for the County sometime between 2010 and 2015 to develop criteria to determine whether projects are infill and to develop incentive programs for infill. Does the County currently have no such criteria and no such incentive programs? The 2003 Tulare County Housing Element reported (p. V-14) that the County was at that time “working on implementing a Density Bonus allowance, as well as provisions incorporated into the PUD standards in the Zoning Ordinance. Many jurisdictions already have developed and implemented working programs to mandate and incentivize smart, resource-efficient, healthy infill development. **This Policy and its IMs must be strengthened, clarified, and prioritized.** Efficient infill development is, of course, also one of the best ways to help preserve agricultural land, as pointed out in the Background Report (p. 11-22): “The need to expand urbanized uses onto farmland can be reduced by developing and redeveloping land in the core areas of communities. For every 100 acres of urban land developed with a mix of single family homes, townhouses, and apartments (assuming an average density of 20 units per acre), 500 acres of farmland can be saved at the edges (assuming a typical density of 4 units per acre (suburban character).” Efficient infill development is a key to achieving many of the other GPU Goals as well. | 117-283

IM #8 (p. 4-34) (for LU-1.8) is “ongoing” in terms of the GIS database, and totally vague on “encourage” new development to occur on identified sites. If this IM is ongoing, does it mean that the County is already encouraging infill development? If so, how, where, and with what results? | 117-284

IM #9 (p. 4-34): Doesn’t the County already require access to public roads as a pre-requirement for development? **When will the program to consolidate infill sites be implemented?** | 117-285

IM #10 (p. 4-34 is a good idea except that community plan updates and the creation of hamlet plans take many years, and most of them are not even scheduled. What about infill development in these areas in the meantime? Why shouldn’t these inventories be made on a fixed schedule of their own, before more inefficient growth is allowed? Haven’t many communities and hamlets already identified their infill sites, as the City of Visalia has? And, of course, simply identifying infill sites will not cause infill to happen, so this measure does not actually implement any infill. | 117-286

LU-1.9 “Specific Plans” (pp. 4-23—4-25): **The Ahwahnee Principles (or better) should be incorporated in all specific plans or equivalent or similar plans. Impact on GHG emissions must be considered and addressed in Specific Plan Content. The Development Standards (p. 4-24) should include the requirement to meet at least** | 117-287

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

**LEED-Silver or higher or LEED-ND standards for all construction. Landscaping standards (under Design Framework, p. 4-25) must require a high percentage of native plants and mulched xerigraphic landscaping with high-water-efficiency irrigation and the incorporation of natural areas for stormwater and runoff control and infiltration.** Plan approvals and developer impact fees should be tiered in terms of the plan's realization and implementation of these principles and standards. Thank you for including the Water Supply Availability Framework. Why can't the principles of the planning frameworks of the Specific Plans be applied to development with much less acreage? What percentage of developments in the unincorporated County surpass the 80 acre threshold? What about a 40 acre threshold? What about a 20 acre threshold? What is the typical acreage of a development in the unincorporated County?

I17-287  
cont'd

**LU-2.1 "Agricultural Lands" (p. 4-26):** This fine-sounding Policy directing development away from ag lands to developed areas where public facilities and infrastructure are available is eviscerated by the General Plan Update's emphasized and expanded sections on New Towns and new Growth Corridors. Policy LU-2.1 should make itself "self-implementing" by prohibiting the development of New Towns and new Growth Corridors and restricting new development during the life of this Plan to within the existing UDBs and HDBs, which are more than adequate to accommodate it; it is certainly not self-implementing as written. Its only IM is #13 (p. 4-34), which simply says that the County [ongoing] will reinstitute Open Space and Land Conservation contracts for parcels on prime agricultural land meeting the area required under State law. Presumably, this refers to Williamson Act contracts. This certainly provides no mitigation or implementation for the RDEIR impacts, since it is a program that has been in place for decades. Will this continue to be the County's Policy and IM if the State subventions for Williamson Act lands cease? This IM also does nothing to direct urban development away from agricultural lands. What about permanent conservation easements and permanent buffers and separators to effectively implement this Policy?

I17-288

**LU-2.3 "Open Space Character" (p. 4-26):** Thank you for changing this Policy so that it does not specifically mention the scenic open space character of rangelands only, but is now much more inclusive of the County's open space resources. New development should be required to utilize natural landforms and vegetation not only in a manner that is least visually disruptive, but also to preserve natural drainage characteristics and capabilities, in order to minimize flooding and enable natural groundwater recharge (which cleans the water as it is absorbed by the plants and soil). Natural vegetation and landforms should be preserved in order to maintain the character of the land and to provide habitat. Trees, especially, and slopes and outcroppings should be preserved whenever possible. Hilltop and ridgeline development should be prohibited, as it mars the viewshed from every direction and from long distances. Please reword this Policy accordingly.

I17-289

**LU-2.4 “Residential Agriculture Uses” (p. 4-26):** The creation of HDBs, inside which all the land is now exempt from RVLP, certainly contradicts this Policy, as does the County’s intent to permit New Towns and Highway Corridors apparently almost anywhere, without regard to agricultural uses.

117-290

IM#12 (p. 4-34) says that the County shall amend the Zoning Ordinance to increase the time before existing homes qualify for divisions of land. The timeline is 2010. Has the Ordinance been amended? If so, when? What is the increased length of time? The potential effectiveness of this IM cannot be considered without that information.

**LU-2.5 “Agricultural Support Facilities” (p. 4-26), Implementation Measure #16 and #17 (p. 4-35):** This Policy allows agricultural support facilities to be turned into new businesses, including non-agricultural uses, to provide employment.

117-291

**Please change this Policy and its Implementation Measures as follows:** These facilities should be allowed to be converted to non-agricultural uses **ONLY** if they are located contiguously to non-agricultural development; non-agricultural jobs should be located where potential employees and customers live, NOT amidst agricultural areas, which will cause unnecessary traffic in these areas, and promote unnecessary VMTs and GHGs. How will the County “encourage” this reuse? How will turning the facilities to non-agricultural uses support the goal of conserving productive and natural resource lands?

**IM#16** states that the County shall adopt an ordinance to facilitate reuse, but the timeline is ongoing. When is the ordinance going to be adopted? Has it been already? What about the timing and “consideration: of restrictions on re-use?

117-292

**IM#17** says the County shall “consider”(with and “ongoing” timeline) preparing an inventory. This does not constitute an implementation measure.

117-293

**LU-2.6 “Industrial Development” (p. 4-27):** Industrial development should be located where infrastructure, services, and a labor pool already exist, not in PCAs or regional growth corridors unless necessary for the support of agricultural operations. As noted above, #IM16 without a deadline is not a functional IM.

117-294

**LU-2.7”Timing of Conversion From Urban Reserve” (p. 4-27):** A criterion requiring that urban services, schools, and infrastructure CAN be made available seems useless, in that, presumably, such facilities and services always COULD become available. The issue is whether they ARE available or WILL become available, meaning that they are already proposed and funded for development. Please revise this Policy accordingly.

117-295

**LU-3.1 “Residential Developments” (p. 4-27):** This Policy is laudable in concept, but far too vague (how will the County “encourage?”) and has no Implementation Measure. The County should require all new residential

117-296

63

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

development to locate near existing infrastructure, which it can do by requiring all major new development of any kind to occur within existing UDBs and HDBs, and to adhere to the Ahwahnee Principles (or better). **Please change this Policy accordingly and provide it with a concrete Implementation Measure** to ensure cost-efficient and resource-efficient development that will also reduce unnecessary VMTs and GHGs and help the County to comply with AB32, SB375, and the people's priorities..

I17-296  
cont'd

**LU-3.2 "Cluster Development" (p. 4-27):** On page 141 of the Matrix, it is stated that this Policy applies only to the few remaining undeveloped RR properties in the County; **this Policy should be revised to so state, or it will continue to cause confusion.** On the other hand, why should cluster development be applicable on only those parcels?

I17-297

**Implementation Measure #19 (p. 4-36):** The **Implementation Measure** for preparation of a cluster development ordinance is listed as Ongoing, with the contents to be developed "later." Compact cluster development can be a significant means of resource-efficient development that can protect natural resource lands and open space. When will this ordinance be ready for adoption? With no deadline, **this IM is not measurable and cannot serve to implement anything. Please make it concrete and measurable.**

I17-298

**LU-3.3 "High-Density Residential Locations" (p. 4-27):** Matrix p. 142, #2, response states that new Implementation Measures will be added for this Policy, with incentives for affordable housing, but no IMs are listed for Policy 3.3. **Please make this Policy more specific (how will the County "encourage?"), and provide it with the promised IMs.** Page 4-18 of the GPR defines High Density as 14-30 du/acre. LU-3.3 calls for a better minimum of greater than 16.1 du/acre. **This discrepancy should be reconciled.**

I17-299

**LU-3.5 "Rural Residential Designations" (p. 4-28):** Please amend this Policy to state that **no new rural residential development areas will be designated in the RVLP area or the FGMP area** (because RR development – basically ranchettes – is extremely resource-inefficient and slices up habitat and open space and promotes excessive VMTs and GHG emissions).. Buffers can be much better provided via easements or other measures funded by developer impact fees or other sources. If permanently populated (as with RR development), buffers are no longer buffers, and will continue to create ag/urban conflict. Instead, buffers should be open space used only transiently for recreation (e.g., walking, biking, jogging, bird-watching), and should be well-vegetated with native plants to provide sound buffering, visual buffering, groundwater recharge, habitat, etc. Wherever possible, buffers should preserve natural boundaries such as riparian areas and swales that will also provide natural flood control and groundwater recharge. How many parcels are currently designated RR in the County?

I17-300

**LU-3.6 "Project Design" (p. 4-28):** **Please include outdoor lighting in the Project Design Policy; the lighting should be shielded to prevent light trespass and preserve Dark Skies.** Please cite the location of the project design requirement details (is this set forth in an Ordinance, or . . .?). There is no IM for this Policy.

I17-301

**LU-3.8 “Rural Residential Interface” (p. 4-28):** Please clarify this vague Policy: by what means will the County “minimize” these potential land use conflicts? IM#18 (p. 4-35) indicates there is an ongoing “provision” for a graduated transition unless buffers or other measures are determined adequate. Where is the provision to be found? The County will “encourage” the cities to require buffering measures when urban development is proposed, but why can’t the County designate buffers and urban separators ahead of time (like now) to ensure that land-use conflicts will be minimized? Establishing such greenbelts or buffers or urban separators would provide many other benefits and help the County to meet many of its key GPU Goals, as already discussed.

I17-302

**LU-4.1 “Neighborhood Commercial Uses” (p. 4-28):** This welcome policy could serve to reduce VMTs and GHG emissions and promote community centers and gathering places. Please clarify how the County will “encourage” this development.

I17-303

IM#14 (p. 4-34) says the County will “explore implementation strategies.” This, of course, is not an implementation measure by any stretch of the imagination. The exploration was to occur in 2007-2010. It’s 2010. Any results?

I17-304

IM#20 (p. 4-36) says the same thing: “explore implementation strategies,” with the same timeline.

**LU-4.2 “Big Box Development” (p. 4-28):** As part of this Policy, the County should also limit the footprint of “big box” facilities’ parking lots, such as by requiring multi-level structures instead of acres of impermeable asphalt. The multi-level structures would shade and cool the parked cars and would not contribute so much to the heat island effect as gigantic unshaded parking lots, which also have adverse visual impacts. The parking structures AND the “big box” development should have “green” roofs or roofs covered with solar panels and photovoltaics in order to reduce their environmental impacts. It’s not just the size of “big box” businesses that makes them eyesores. Form-based codes could help.

I17-305

Please require all large parking lots which are all one level (on the ground) to include extensive planting and maintenance of large-canopy trees (preferably natives, for drought tolerance and habitat), landscaped pathways (for safety, beautification, and shade), and extensive use of permeable paving to reduce negative groundwater impacts. These configurations also attract shoppers.

**LU-4.3 “Commercial Service Locations” and LU-4.4 “Travel-Oriented Tourist Commercial Uses” (p. 4-29):** Same comments as for LU-4.2.

I17-306

**LU-4.5 “Commercial Building Design” (p. 4-29):** Please change “encourage” to “require.” “Encourage” is too vague to make anything happen, and there is no IM for this Policy. Also, same comments as for LU-4.2.

I17-307

**LU-4.6 “Commercial Storage Facilities” (p. 4-29):** Does the County already require such screening, or this Policy to be put into effect sometime in the future (it’s said to be a new policy)? To what degree will these facilities be screened from view? For example, a mini-storage facility was built in the unincorporated County along Highway 198, a potential State scenic highway, not long ago. Its “screen” is a chain link fence about 5 feet high with a very skimpy vine on parts of it, providing no effective screening at all. There is no IM for this Policy. Please provide much more specific detail. | I17-308

**LU-5.1” Industrial Developments” (p. 4-29):** Please add “The County shall focus on attracting clean, sustainable, energy- and water-efficient industrial development.” It is critical that we do not attract industrial development that will worsen our air quality and our water emergency and create adverse GHG emissions impacts. Please clarify this Policy by stating how the County will “encourage” these developments and what the criteria are for “appropriate” locations. | I17-309

**IM#15 (p. 4-34)** states only that “GIS shall be used when evaluating the impacts of proposed industrial areas when community or hamlet plans are developed or updated.” How will GIS be used? What happens during the years when communities and hamlets have no plans? What about all the other areas now proposed for development (MSCs, highway corridors, PCAs, etc.)? | I17-310

**LU-5.2 “Industrial Park Developments” (p. 4-29):** Please add that these developments shall adhere to the Ahwahnee Principles (or better) and LEED Silver (or better) standards. **Landscaping** must be xerigraphic (using native plants as much as possible), mulched, and drip irrigated with recycled water. These developments must also provide for and encourage alternate transit (e.g., sheltered bus stops, secure bike parking), must be as **energy- and water-efficient** as possible; must utilize permeable paving wherever feasible. Please clarify how the County will “encourage” these developments and what is meant by “suitable topography.” These developments should be located where infrastructure and public services (e.g., police, fire) already exist, and near labor pools, and daily services such as restaurants, ATMs, day care centers, etc. | I17-311

Only **IM#15** is listed for this Policy; please apply IM#15 comment directly above. | I17-312

**LU-5.3 “Storage Screening” (p. 4-30):** This Policy is much too vague and has no IM. What’s “adequate?” Does the County already require such screening, or this Policy to be put into effect sometime in the future (it’s said to be a new policy – from November, 2005)? To what degree will these facilities be screened from view? For example, a mini-storage facility was built in the unincorporated County along Highway 198, a potential State scenic highway, not long ago. Its “screen” is a chain link fence about 5 feet high with a very skimpy vine on parts of it, providing no effective screening at all. There is no IM for this Policy. Please provide much more specific detail. | I17-313

LU-5.4 “Compatibility with Surrounding Land Use” (p. 4-30): Here is yet another text too vague to constitute a Policy and with no IM. How will the County “encourage” the infill, and what is meant by “significant harmful impacts” to adjacent land uses?	I17-314
LU-5.5 “Access” (p.4-30): The County should require that all industrial development be located so that it can be readily served by public transit and should require developers to include facilities to accommodate and encourage transit (e.g., shaded, sheltered bus stops and secure, sheltered bike storage areas).	I17-315
LU-5.6 “Industrial Use Buffer” (p. 4-30): Please see other comments re buffers throughout these comments and apply them here as well. All heavy industrial uses should be located a minimum of 500 feet from schools, hospitals, and residential areas, and the buffers should be designed for multiple use and benefits: stormwater management, habitat, wildlife corridors, groundwater recharge, recreation, screening, planting and maintenance of native plants, -- including many trees, etc. The first sentence of this Policy needs to be rewritten. It says “prohibit new uses to a minimum of 500 feet.” It should “require” new uses to be located a minimum of 500 feet from . . . .” Please also require Industrial Uses to minimize light trespass, to meet Dark Skies lighting standards, and to include net zero energy solar systems and/or “green” roofs to help to minimize their adverse impacts. Please include an IM for this Policy specifying how the buffer area shall be landscaped and maintained.	I17-316
LU-5.7 “Industrial Uses Allowed on Resource Land” (p. 4-30): Industrial uses on Resource Land should be required by their SUP to buffer their operations in order to minimize their impacts on Dark Skies, scenic landscapes, noise, GHG emissions, storm drainage, water supply and quality of life. All such industrial uses must be required by their SUP to timely restore (with a fixed deadline) the resource land on which they are operating to a condition that will enable future beneficial use and to provide bonds or pay fees or deposit money to a trust account controlled by the County to ensure that the resource land will be restored for future beneficial use at the end of the industrial use’s operation. Such restoration should include the removal of all waste, including any toxic waste, and restoring natural landforms, drainage, and vegetation. Please include these criteria as a minimum and provide an IM for this Policy to clarify and strengthen it.	I17-317
LU-6.1 “Public Activity Centers” (p. 4-30): These centrally-located public activity centers are an excellent concept, but this Policy is too vague to be relied on to accomplish anything, and it has no IM. Please state how the County will “encourage” their development and provide a concrete, measurable <b>Implementation Measure</b> .	I17-318
Please require these centers to be built in accordance with the Ahwahnee Principles (or better) and to LEED-Silver (or better) standards to serve as models and inspiration for future development in their communities, and make them less expensive to operate and maintain.	I17-319

**Please require** that these key activities be **clustered** in a central location and be readily accessible via alternate transit and active transit in order to reduce VMTs and GHGs and help to comply with AB32, SB375, and the County's Climate Action Plan. | 117-320

**LU-6.2 "Buffers"** (p. 4-30): **Please add that, for efficient land use, and to encourage alternate and active transit, buffers, whenever possible, should be designed to serve multiple beneficial purposes:** they should provide open space that can be used for recreation (e.g., walking, biking, jogging), and as transit alternatives; they should be well-vegetated with native plants to provide sound buffering, visual buffering, groundwater recharge, air cleaning, habitat, etc.; wherever possible, buffers should preserve natural boundaries such as riparian areas and swales that will also provide natural flood control and groundwater recharge. Buffers should be corridors of natural beauty and abundance, giving wildlife and native plants a chance in a paved-over world, and providing relief and regeneration to people, too. **Any paving in buffer areas should be permeable** whenever feasible. How will the County ensure this separation and buffering? There is no IM for this Policy. | 117-321

**LU-6.3 "Schools in Neighborhoods"** (p. 4-31): For the health of our air and the health of our children, **please make every effort** to get districts to locate schools where Safe Routes to Schools can be ensured and where schools will not be impacted by pesticide drift or other adverse agricultural or industrial activities. How will the County "encourage" the districts? | 117-322

**LU-7 "Community Design" Goal** (p. 4-31): This is a fine quality of life Goal that could also be very beneficial to local economies. Unfortunately, as is typical throughout the GPU, the following Policies and IMs cannot be relied on to achieve the Goal, as they are so vague ("encourage," "assisting," "promote") and too often have no IM at all, or an IM that is equally vague and unmeasurable. | 117-323

**LU-7.1 "Distinctive Neighborhoods"** (p. 4-31): **Please clarify this wonderful policy by stating how the County will "encourage" such development, and provide it with a concrete Implementation Measure. Please implement strong, clear, tiered incentive and impact fee schedules** to help make this happen. It is also very important that the neighborhoods use natural resources efficiently (land, water, and energy), and include complete streets that provide for alternate and active transit. Ahwahnee and LEED-ND principles and standards should be applied to all new neighborhood development to promote compliance with AB32, SB375, and the County's Climate Action Plan. | 117-324

**LU-7.2 "Integrate Natural Features"** (p. 4-31): If a community's natural features (e.g., wetlands, drainage patterns, riparian habitat, oak woodlands, etc.) have been destroyed or obliterated by previous development (e.g., cleared and laser-leveled for agricultural use), **an open space reserve should be established** within the community in which natural features can be restored, providing beauty, habitat, recreation, character and identity, and better | 117-325

health. This Policy needs clarification (what does “emphasize” mean?) and an IM to concretely and measurably make it happen.	I17-325 cont'd
LU-7.3 “Friendly Streets” (p. 4-31): Please add to this welcome Policy a bullet: <b>new streets to be constructed in a traditional grid pattern, without cul de sacs, to facilitate walking, bicycling, and transit access, and to reduce VMTs</b> , which would not only facilitate healthier communities, but could contribute to compliance with AB32, SB375, and the County’s Climate Action Plan. <b>Please clarify</b> how the County will “encourage” compliance with this Policy, <b>and provide it with a concrete, enforceable Implementation Measure (as written, this Policy requires nothing). Street tree planting should require native, large-canopy trees wherever possible, and always drought-tolerant trees.</b> What would make sidewalks on both sides of streets not “feasible?” If these are new streets, why would bike lanes and walking paths not be “feasible?” <b>New streets must also be required to provide for public transit, with bus parking areas and shelters included.</b>	I17-326
LU-7.4 “Streetscape Continuity” (p. 4-31): There is no IM for this Policy. How will the County ensure its implementation?	I17-327
LU-7.5 “Crime Prevention Through Design” (p. 4-31): This Policy is too vague (“encourage), and its only IM (#22, p. 4-36) says only that the County will work with others to research CPTED guidelines and develop standards as an informational tool for developers sometime in the next 5 years. CPTED guidelines and models are available online; providing information to developers does not require anything to happen.	I17-328
LU-7.6 “Screening” (p. 4-31): Please add that the landscaping must be xerigraphic, native plants whenever possible, mulched, drip-irrigated, and irrigated with recycled water. It must <b>also include large-canopy trees</b> to maximize shading, cooling, and air-cleaning capability. Please apply here our other “screening” comments on this GPU (e.g., for LU-5.3, LU-4.6, etc.) as well. This Policy needs an IM to show by what means the County will require this and to provide concrete, measurable, enforceable information on what “adequately” and “minimize” mean.	I17-329
LU-7.7 “Parking Location” (p. 4-32): Please add that parking areas shall be required to be <b>well-shaded</b> with either shade structures roofed with solar/photovoltaic panels or with large-canopy trees (preferably native species), or both, and that parking areas must <b>maximize permeable hardscape</b> surfaces to facilitate effective groundwater recharge and reduction of stormwater runoff; <b>paving of parking areas must be light-colored</b> to minimize heat island effects; parking areas shall include a shaded, secure area for <b>bicycle parking</b> . Please clarify how the County will “encourage” these parking locations and provide an effective IM for this Policy.	I17-330

LU-7.8 “Building Abatement” (p. 4-32): This vague Policy does not state how it is “assisting” property owners or how it shall “focus on” abatement of structures; there is no IM.	I17-331
LU-7.9 “Visual Access” (p. 4-32): By what means will the County require new development to maintain visual access to views? There is no IM for this Policy.	I17-332
LU-7.10 “Gateways/Entry-points” (p. 4-32): How will the County “support” “programs and projects that enhance gateways and transitional zones,” and what might those programs and projects entail? This Policy is too vague to achieve any Goal, and it has no IM.LU-7.11 “Adaptive Reuse” (p. 4-32): Please provide the fine idea of this Policy with specific, enforceable language and a concrete implementation measure that will put it into practice; how will the County “encourage”and “promote” adaptive reuse and preservation, and what is meant by new development “should respect” significant buildings and areas?	I17-333
LU-7.12 “Historic Buildings and Areas” (p. 4-35): Please make this policy specific (“encourage” ” how?). Also “should” is not a Policy. The Implementation Measure (#23, p. 4-36) says that the County shall “cooperate” with others to “encourage” perpetuation of identified architectural characteristics in new proposed development within the same view shed. That is not the same thing at all as preserving buildings and areas with special value. This IM will do nothing to implement LU-7.12. In the RDEIR (p. ES-8, etc.), this Policy is even further weakened; it has been rewritten to say that “The County shall seek to encourage” preservation of these special places. It has added the provision that “Landscaping, original roadways, sidewalks, and other public realm features of historic buildings or neighborhoods shall be restored or repaired where ever feasible.” Who will perform the restoration or repairs?	I17-334
LU-7.13 “Preservation of Historical Buildings” (p. 4-32): Same comment as for LU-7.11 above.	I17-335
LU-7.14 “Contextual and Compatible Design” (p. 4-32): By what means will the County “ensure” that new development reflects the County’s heritage? What is meant by requiring new development to “respond to” its context? What is meant by “develop in an orderly fashion?” The ideas behind this Policy sound great, but it is too vague to be enforceable, and there is no IM.	I17-336
LU-7.15 “Energy Conservation” (p. 4-32) and Implementation #24 (p. 4-36): Please strengthen this extremely important Policy and move its implementation to well BEFORE 2015. Please change “encourage” to “require.” The Ahwahnee Principles and the LEED certification program could be adopted and implemented right away; LEED-ND has also now been issued, . Many additional ideas for Energy Efficiency and Renewable Energy measures are available on the website of the Office of the California Attorney General and on the State’s OPR website and on numerous other sites presumably well known to County planners and decision-makers. These sites also list other jurisdictions which have adopted and implemented such measures. How about 15% above Title 24	I17-337

requirements? With global climate change already impacting us, AB32 urging us on, and the new County Climate Action Plan to effect, please adopt and implement a highly effective Energy Conservation policy well before 2015. By the end of 2010 would be a good goal.

I17-337  
cont'd

**LU-7.16 “Water Conservation” (p. 4-32):** Thank you for adding a Policy regarding Water Conservation. Unfortunately, a Policy that only “encourages” will not effectively address this absolutely critical issue, especially when its IM (#24, p. 4-36) says only that the County shall review LEED and LEED-ND requirements and develop an implementation program (by 2015). **(NOTE that p. 84 of the CAP says that within the first year after the adoption of the CAP development of a LEED/LEED ND Implementation Program should be initiated. Why will it take up to 5 years to develop it?)** What is meant in the Policy by “‘extra-ordinary’ water conservation and demand management measures?” Given that Tulare County has the greatest groundwater overdraft of all the counties in California (comprising about half of the State’s total), the County should be addressing water conservation, water reuse, water recycling, water quality, and groundwater recharge immediately and strenuously. This Policy should apply to not just new development, but to retrofitting existing development as well, and it should also apply to agricultural uses. Global climate change has been shrinking our local snowpack for the last 50 years, and runoff is coming earlier, with more precipitation coming as rain than as snow. Our water issues cannot wait five more years to be addressed.

I17-338

**LU-7.17 “Shared Parking Facilities” (p. 4-32):** This Policy to “encourage,” where feasible, shared parking facilities is too vague to be meaningful and has no IM. How will this happen, and when?

I17-339

**LU-7.18 “Lighting” (RDEIR, p. ES-12):** This new “required additional mitigating policy” says the “County shall continue to improve and maintain lighting in park and recreation facilities to prevent nuisance light and glare spillage on adjoining residential areas.” How can this Policy be new if it says the County “shall *continue*?” **The County should ensure that park and recreation facility lighting is energy efficient and complies with Dark Skies lighting standards as well.** Does this policy apply only to County-maintained facilities? The Background Report (p. 4-3) states that there are only 13 park and recreation facilities owned and operated by the County, and the County is not proposing any new parks due to budget restrictions for operation of the facilities. How will this affect the County’s ability to continue to improve and maintain lighting in park and recreation facilities?

I17-340

**LU-7.19 “Minimize Lighting Impacts” (RDEIR, p. ES-12):** This new “required additional mitigating policy” says the “County shall ensure that lighting in residential areas and along County roadways shall be designed to prevent artificial lighting from reflecting into adjacent natural or open space areas.” **Please clarify this Policy by indicating how this will be ensured. Please add to this Policy that the County shall require all exterior lighting in all new development to be energy efficient, to utilize motion sensors wherever feasible in order to turn lights off automatically when not needed, and to meet Dark Skies standards.**

I17-341

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

## 6. HOUSING [and BLUEPRINT]

The GPR (p. 6-1) states that a new Tulare County Housing Element ,was adopted on March 23, 2010. **Is this new Housing Element intended to be incorporated into the GPU in its final version?** | I17-342

**Why isn't there any information for readers of the GPR about the contents of the Housing Element; the only information provided is how to read it online or get a copy of it from RMA.** (An Addendum to the Background Report provides this same information.) The Housing Element (p. 8) states that, "In accordance with State law, the Housing Element is to be consistent and compatible with adopted General Plan elements. Additionally, the Housing Element is to provide clear policy and direction for making decisions pertaining to zoning, subdivision approval, housing allocations and capital improvements. Section 65300.5 of the Government Code requires the general plan and elements and parts thereof comprise an integrated, internally consistent and compatible statement of policies for the adopting agency." | I17-343

**Immediately, the Housing Element (HE) becomes inconsistent with the GPU GPR.** It states that UDBs have been established around many of the unincorporated communities, but does not include Lemon Cove or Sultana, both of which appear on the County's list on GPR pp. 1-5 – 1-6. The HE says (p. 9) that "at some future date," UDBs are to be adopted around the communities of Lemon Cove, Sultana, and Allensworth. The HE makes no mention of Hamlet Development Boundaries, nor even of hamlets, but the GPR lists 11 hamlets (including Allensworth) and assigns HDBs to all of them. | I17-344

The HE states that Land Use Plans have been prepared for a list of unincorporated communities, and specifically designate areas suitable for residential development. The list includes nine communities that have adopted community plans. It also lists: Exeter Urban Area, Lindsay Urban Area, Tulare Urban Area, Woodlake Urban Area, Southwest Visalia Land Use Plan, East Porterville Land Use Plan, Dinuba Urban Area, Farmersville Urban Area, Porterville Urban Area, Visalia Urban Area, and West Exeter, most of which may refer to what are termed as "eight existing County Adopted City General Plans, including two neighborhood plans" on pp. 1-4 – 1-5 of the GPR; the GPR includes East Porterville Neighborhood Plan and Patterson Tract Neighborhood Plan, which are not listed in the HE, although it says that planned land uses for the remaining unincorporated communities are contained in the 1966 Tulare County General Plan. The HE (p. 9) also lists Kennedy Meadows, Great Western Divide, and Kings River Plan; these are listed in the GPR (p. 1-4). But the GPR lists other existing sub-areas that have plans and others that do not (p. 1-4). The GPR also calls for adopting two additional County Adopted City General Plans with UDBs (Delano and Kingsburg, GRP p. 1-5). The GPR also lists 16 Mountain Service Centers (p. 1-6), none of which are mentioned in the HE. **The HE has no information on many of the places listed in the GPU. The information and designations in the HE and the GPU must be made to match, for consistency, and to provide a clear and full understanding of the environmental and economic impacts of the GPU project.** | I17-345

## TULARE COUNTY REGIONAL BLUEPRINT:

The HE includes the **Housing Goal from the Tulare County Regional Blueprint**, “a stand-alone policy document that is consistent with the San Joaquin Valley Regional Blueprint” (p. 14). “This document represents Tulare County’s local vision and goals as a participant in the San Joaquin Valley Regional Blueprint process.” The **County’s goal is to provide a variety of affordable and quality housing choices throughout the region for people of all income levels and abilities.**

I17-346

The **Objectives** include (HE p. 14):

Promulgate and promote adoption of *community design guidelines that will ensure strong neighborhoods, increase efficiency by promoting green building practices, integrate housing with jobs and schools, improve mobility and health by promoting walking and biking, improve air quality by reducing trip generation, and increase infrastructure cost-effectiveness through efficient land use.*

*Increase the overall average density of new development.*

Ensure *safe and healthy communities* that provide a variety of housing types with increased opportunities for homeownership.

Provide *incentives* for local jurisdictions to meet their housing needs.

Provide an adequate supply of housing for our region’s workforce and adequate sites to accommodate business expansion and retention to *minimize interregional and long distance commuting.*

I17-347

“San Joaquin Valley Blueprint community workshops in Tulare County ranked ‘**Healthy and Sustainable Environment**’ as a top priority, to ‘keep our environment and our residents healthy now and in the future’ with reduced traffic congestion, reduced vehicle miles traveled, alternative energy solutions and increased recreational open space and facilities, among other values. Another top priority was ‘**Natural Resource Protection,**’ to protect scarce resources such as valuable agricultural land, water and air, and to establish and maintain growth boundaries, to grow efficiently, supported by set land use policies and development standards, among other values.”

I17-348

This Blueprint information should be emphasized in the GPU. The Blueprint workshops afforded more current opportunities for the public to provide input on their priorities and values for the County’s future, and the importance of supporting regional planning objectives to address our regionally-shared problems (e.g., air quality, GHG emissions, global climate change, water quality and availability, etc.) must be made clear in the GPU. The Background Report never mentions the Blueprint, other than to say that TCAG is in the process of developing the Blueprint Planning Process (p. 3-82), with no further explanation or information.

I17-349

The RDEIR states that “the proposed project addresses the issue of climate change in a variety of ways that include adopting a land use plan that is consistent and supports Tulare County Regional Blueprint principles, along with implementation of a variety of policies designed to reduce both mobile . . . and stationary sources (.e., supporting energy efficiency and conservation measures that exceed State Title 24 standards) of GHG emissions” (p. 3.4-32). The RDEIR repeats this sentence, but substitutes “regional blueprint” for Tulare County Regional Blueprint (p. 3.4-39). RDEIR p. 4-32 says that “Boundary expansion is consistent with the San Joaquin Valley Regional Blueprint,” while p. 4-33 says “*The hard boundaries concept would link well with the intent of the San Joaquin Valley Regional Blueprint to protect important agricultural resource areas and natural habitats.*”

I17-350

**Only when we get to the Climate Action Plan (CAP), which the County says it will not adopt with the GPU, but at some later, unspecified time, do we learn about the Regional Blueprint.** Page 2 of the CAP explains that the San Joaquin Valley Blueprint project developed a vision for development in the San Joaquin Valley to year 2050, and that the Tulare County Association of Governments (TCAG, consisting of the five members of the Tulare County Board of Supervisors, a representative from each city, and three appointed public members) participated in that project and then developed a Regional Blueprint Vision for Tulare County.

**CAP p. 3 states the Tulare County Blueprint vision:**

I17-351

“To preserve and enhance the Tulare County region’s unique features – its vibrant and culturally diverse communities, its rivers, farmland, mountains, recreational opportunities, natural areas, and national parks. To promote sustainability through a well-trained and educated workforce, and a healthy and diverse economy. To ensure that the urban and rural areas of the County are thriving and residents can enjoy a well-planned, well-designed, and maintained land use structure and transportation system that offers a variety of housing choices, mixed uses, and numerous ways to get from place to place.”

**Nowhere does this mention the health, safety, and welfare of the population, air quality, water supply and quality, GHG emissions or global climate change, the foothills, native flora and fauna, or the ecosystem on which the “features,” “workforce,” “economy,” and “housing choices” depend. This failure to focus on and fully acknowledge and consider these fundamental priorities is one of the great flaws of the GPU.**

Note again that the top priority in the Blueprint workshops was a healthy and sustainable environment, with residents’ health, protection of natural resources, reduced VMTs, more recreational open space, alternative energy sources, and growing efficiently with set land use policies and development standards also given high importance. And, as noted throughout these comments, the Policies and Implementation Measures in the GPR will not serve as adequate, effective, or enforceable implementation and mitigation measures for the environmental impacts of the proposed project.

Page 45 of the CAP states that the emission reductions are based on the development being consistent with the goals, policies, and implementation measures in the General Plan, and the TCAG Blueprint Vision. Page 50

I17-352

74

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

says the TCAG Blueprint's preferred land use scenario was the 25% Density Increase Scenario, which "increased residential density by 25% and shifted the housing types to medium and high densities." This scenario, however, produced far less density than what was voted for by the public attending the Blueprint workshops (e.g., at the wrap-up Blueprint meeting in Tulare County in April, 2008, 55% of the respondents voted for the greatest density scenarios, with 25% voting for 50% density increase and 30% for 75% density increase) and the average of 6.8 du/acre in the SJV adopted growth scenario. Tulare County's current average density is only 4.3 du/acre, and the proposed 25% increase density is a mere 5.3 du/acre (pp. 57-58) .	I17-352 cont'd
Page 51 says that the Blueprint is expected to provide a significant part of the SB375 regional targets reductions for Tulare County, and that SB375 provides incentives that will help to ensure that the County implements the Blueprint scenario.	I17-353
Page 52 says "the effectiveness of the measures [shown in Table 10] depends on land use pattern and transportation infrastructure in the vicinity of the project. The preferred Blueprint development scenario as supported by the General Plan will help to maximize the effectiveness of the measures."	I17-354
Page 54 says that the General Plan uses a forecast of 10.5 percent employment growth by 2030 in unincorporated areas of Tulare County, which reflects Blueprint and General Plan policies to focus development in cities and existing rural communities. The County has already planned a substantial number of lots for development. But it "expects that new development proposals will be received that are more likely to develop before existing lots are developed because the rural community, landowner, or developer has the resources to provide all improvements and services required for the site. As a rough estimate, this analysis assumes that 40 percent of the development will occur on existing lots and 60 percent will occur in new development." Only "the development occurring in new subdivisions and projects would be subject to additional measures required to mitigate significant impacts" (p. 55).	I17-355
The 25% increase in average development density that would be achieved by meeting Blueprint goals is expected to result in lower trip generation (p. 56). The Blueprint "assumes" that the County's transportation system will be improved over time by increasing transit use and other alternative travel modes, such as light rail service to be provided between Tulare and Visalia and improved regional bus service (p. 56). [Seriously, what are the chances of light rail service being provided within the GPU horizon? Have any plans been drawn up, any funding secured, rights of way been secured?]	I17-356
The CAP states that the County is incorporating the principles of the Tulare County Regional Blueprint in the 2030 General Plan Update (p. 56). "The County's authority over land use provides its most important contribution to efforts to reduce greenhouse gas emissions related to new development," and as new development is constructed consistent with the General Plan and the Blueprint, existing development will benefit from infill and better transportation options (p. 64).	I17-357
The County will commit staff resources to engage in regional transportation initiatives, such as the Regional Blueprint and San Joaquin Partnership [should be California Partnership for the San Joaquin Valley] that encourage regional planning and economic development (p.73).	I17-358

Farmland can be protected from premature development by focusing development in the existing urban areas at higher densities than were constructed in the past, and as identified in the TCAG Blueprint Preferred Growth Scenario (p. 79). [The miniscule increase in density will have a very limited and poor effect on conserving farmland, given the huge increase in population projected for the unincorporated County by 2030.]

I17-359

As part of the annual report to the Board of Supervisors on progress in implementing the General Plan, staff will report on benchmarks achieved that implement goals, objectives, and policies having air quality, climate change, and sustainability benefits, including a TCAG Tulare County Regional Blueprint implementation status report (p. 83). The County will review land use and transportation data collected from the previous 5 years for comparison to goals for TCAG Blueprint (multiple years of data are needed to account for market fluctuations) (p. 84).

I17-360

Unfortunately, the Policies and Implementation Measures of the GPR and RDEIR (and as listed in the CAP) are so vague, weak, unenforceable, and unmeasurable that these reports are likely to be equally vague, weak, and ineffective, showing very little accomplished in the way of improving air quality, water supply and quality, energy efficiency, reduction of GHGs, significantly improved active and alternate transit routes and availability, conservation and preservation of natural resources and agricultural and open space lands, a healthier population, and a more diverse and sustainable economy.

The HE states that "Tulare County's 2030 General Plan update encourages growth around cities with existing jobs, service, and amenities, in order to reduce long commutes, congestion and air pollution. County recognizes that mixed uses, infill and compact development patterns are related to housing affordability, reduced energy consumption, conservation of land resources, reduced pressure to convert agricultural resources, and protection of wildlife habitat and open space." **The GPU does give lip service to these critical principles, but, as is been pointed out throughout these comments, it does not provide the clear Policy direction and concrete, measurable Implementation Measures that are essential to reaching these goals and achieving the priorities of the County's residents (and to providing the implementation and mitigation required in the RDEIR). The GPU must be revised to be made consistent with the already-adopted Housing Element and Blueprint.**

I17-361

**The Housing Element and the Blueprint must be discussed in the Background Report and RDEIR and the other GPU documents, because they must be factors in the County's decision-making about where and how the County should grow, and must be considerations in constructing the RDEIR Alternatives.**

I17-362

The Tulare County Housing Element "contains standards and plans for the improvement of housing and *for the provision of adequate sites*" and "makes *adequate provisions for the housing needs of all economic segments of the unincorporated area of Tulare County.*" It identifies both "immediate and prospective needs for market-rate and nonmarket-rate households and sets forth a program to meet identified needs."

I17-363

Among many other things, the law requires the Housing Element to be updated at least every five years, to incorporate the regional allocation of housing needs by income group, and to identify adequate sites suitable for all

76

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

income levels (including multiple-family, mobile homes, emergency shelters, etc.), and it includes a **State-mandated density bonus of up to 35% for projects that provide affordable housing for various lower income groups.**

117-363  
cont'd

The Housing Element tabulates the **housing units in the unincorporated County, analyzes special housing needs,** lower income households overpaying for housing (36% of those renting), number of overcrowded households (down to about 13% and number of housing units needing rehabilitation/replacement (showing shocking **percentages of deteriorated and dilapidated housing** in many of the County's communities: e.g., only 5% of the housing is sound in Allensworth, with 25% deteriorated and 70% dilapidated; only 15% sound in Alpaugh, only 17% sound in Delft Colony, only 14% in East Orosi, only 15% in Matheny Tract, only 13% in Plainview, etc.).

117-364

"A comparison between the 2003 housing condition survey and the recently completed 2009 survey shows that substandard housing conditions in the unincorporated communities of the County has generally increased during the past six years. **Twenty-two communities have experienced an increased percentage of substandard housing,** seven are showing improvement by reducing the percentage of substandard housing, and one community showed no change. . . .(HE p. 78)." "A review of these comprehensive tables reveals a strong presence of sound housing conditions within the mountainous areas of the County as well as in and around incorporated cities" (p. 78). "The data illustrates the disparity between the housing stock adjacent to the incorporated cities and housing stock in the unincorporated communities of the County. . . . The rates of deterioration and dilapidation are more prevalent in the unincorporated communities compared to deterioration and dilapidation in the county island and fringe areas. Housing conditions in the residential tracts paralleled the condition of the unincorporated communities" (p. 77).

It **projects numbers of housing units needed in unincorporated communities** and states that an adequate amount of residentially zoned vacant land is available. It reports that the "County's goal is to encourage housing development that is consistent with existing patterns of neighborhood development and current zoning. . . . the County has chosen to highlight infill sites with potential for transit oriented and mixed use development located within existing and proposed development boundaries" (p. 160). It also shows (HE p. 31) unemployment rates in the unincorporated communities as being generally substantially higher than in the incorporated cities (HE p. 31), with, e.g., Alpaugh reporting 34.9%, Cutler 33.3%, Earlimart 38.3%, Richgrove 43.5%, Terra Bella 36.8% (compared to, e.g., 8.9% unemployment in Visalia, 17% in Lindsay, 20.5% in Dinuba), as of December 2008 (would the seasonality of farmwork be a factor in December?).

**Why doesn't the Background Report include this type of information?** The BR discusses water and wastewater issues for at least some of the unincorporated communities, **but never mentions their housing issues;** surely, these **must be a factor in the GPU's land use planning and direction of growth and development.**

The Housing Element states that a home should be suitable, affordable, and in a **satisfactory environment** (“one in which residents are beneficially influenced by services such as adequate public facilities, access to employment opportunities, transportation, compatible adjacent land uses, and convenient access to commercial uses,” (HE p. 3), and that Tulare County is concerned about the issue of farmworker housing and the issue of affordable housing in general (farmworkers have the lowest income and educational attainments, and the highest poverty rate of any occupation surveyed by the Census Bureau; people with a farming occupation comprise 26% of the total in the unincorporated areas of the County).

I17-365

Yet many of the unincorporated communities, primarily due to sewer and water constraints, can support no medium or high-density residential development (e.g., Alpaugh, East Orosi, Lemoncove, London, Plainview, , , and Woodville). **Where and how does the GPU describe and address these concerns?** Shouldn’t this be a factor in determining where and how the County should direct growth? “Availability of community water and sewer facilities is the controlling factor in determining the actual density that can be approved for a particular project” (HE p. 90). “It is evident that availability of community sewer and water systems is critical to the provision of higher density zoning in the unincorporated area. . . . General Plan policies encourage most urban residential development in the unincorporated area around cities to occur upon annexation to a city, in conjunction with city sewer and water systems. Residential development in the foothills is dependent upon the holding capacity of the site with regard to water, waste disposal and other physical considerations” (HE p. 90).

**Lack of community sewer and water systems**, in addition to posing potential health hazards, can result in further constraints on residential development (e.g., most funding agencies will not loan funds for new housing unless the site can be provided with community sewer service, p.95.

I17-366

**Please describe the impact of this funding constraint on where and how the County should grow.** Where is this constraint discussed in the GPU documents and reflected in its policies and implementation measures?

The County reported in the last Housing Element (2003) that it was working on implementing Density Bonus allowances, with the Ordinance expected to be adopted by the end of FY 2003-04. The current Housing Element says that the County “is in the process of preparing” a Density Bonus Ordinance consistent with State law, but that it will not be completed until after adoption of the 2030 GPU. The Ordinance will allow greater density bonuses and incentives and concessions for affordable and senior citizens housing; it is now scheduled to be adopted by 2012. (The most recent State law on density bonuses referred to is SB1818, which became effective in 2005.) **Why is it taking the County so long to prepare and adopt this Ordinance that is a key to promoting affordable housing in the County? How can the County be relied on to implement any of its indicated mitigating and implementing policies and measures if this is typical of its dispatch in addressing consistency with State law and promises to promote affordable housing?**

I17-367

The Housing Element also states that it is County policy that when locating agricultural industry in rural areas, a determination should be made that there are transit opportunities and an adequate employment base living within a reasonable distance of the site (p. 144). **Where are these factors discussed in the GPU documents and reflected in its policies and implementation measures?**

I17-368

The HE says (p. 91) that:

“Any development proposed in the unincorporated area within a city’s UAB is forwarded from the County to the affected city for review and comment. Because it is planned that most land within these boundaries will at some future time be part of the cities, the County Planning Commission and Board of Supervisors give serious consideration to the approval or denial of a project. Unincorporated communities with municipal advisory councils are also afforded an opportunity to comment upon proposed project[s] within their respective communities.”

I17-369

**The Planning Framework in the 2010 version of the GPR appears to move distinctly away from this approach, making communication and cooperation optional on the County’s part. Where are the municipal advisory councils discussed in the GPU documents?**

## COMPONENT C – ENVIRONMENT (GPR p. C-1 ff)

I17-370

The first sentence of this Component states that the General Plan “provides *guidance for the protection of natural and cultural resources and the protection of the health and safety of County residents* with an emphasis on *enhancing scenic landscapes, reducing pollutants, minimizing the threats of man-made and natural hazards, and maintaining adequate water supplies.*” Unfortunately, the “guidance” provided by the Goals, Policies, and Implementation Measures of the GPU documents is very rarely sufficiently clear, measurable, and enforceable enough to ensure that the desired results will be achieved (or in many cases that they will even be worked on). As mentioned above in the Housing Element comments, protection of natural and cultural resources and the health and safety of County residents were top public priorities in the Tulare County Blueprint proceedings, so it is especially important that the GPU documents focus on strong, concrete, immediate and ongoing actions to provide this protection.

**Why does this Component make no mention of global climate change, which is probably THE most threatening of man-made hazards that we must address, and that is already adversely impacting Tulare County?**

I17-371

**The County has made no changes in content in pp. C-1 – C-3 compared to the 2008 GPR except to list on p. C-3: “Animal Confinement Facilities Plan (ACFP) Phase I [Not included in this document, previously adopted.]”**

I17-372

79

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

**Concept 1: Scenic Landscapes (p. C-1):** How and where does the General Plan “enhance” the County’s irreplaceable scenic landscapes? How does the General Plan improve upon Nature’s handiwork? “Preservation” can keep these landscapes as they are, beautiful and functional, providing watersheds, forests, viewsheds, grasslands, habitat and biodiversity, tourism and recreational opportunities, carbon sequestration, air cleaning and cooling, etc., and thus preserve our irreplaceable natural capital and high-functioning natural ecosystem services. Their preservation is certainly “critical to the future of the County.” How will the County assess the benefits that these landscapes provide? It must be sure to weigh the value of their ecosystem services and their natural capital. What kind of programs would preserve this resource to the fullest extent? What kind of programs would use this resource to the fullest extent? Are these programs mutually exclusive? If not, how can they be balanced?

I17-373

**Concept 2: Environmental Resources Management (p. C-1):** What would make it impossible to avoid development in naturally and culturally sensitive areas?

I17-374

**Concept 3: Air Quality (p. C-1):** Please include development and construction practices and land use practices in this list. Water use practices should be included also because pumping and distributing water accounts for major percentages of our energy use and consequent GHG emissions.

I17-375

**Concept 4: Health and Safety (p. C-1):** More threatening to the health and safety of the County and its future and the welfare of its residents are the impacts of global climate change, already affecting us by shrinking our snowpack, bringing more precipitation as rain than snow, causing earlier run-off, and bringing hotter temperatures. Certainly the Environment Component must discuss Global Climate Change (it will also affect air quality and water supply).

I17-376

**Concept 5: Water (p. C-1):** Please add that an important component of our water strategy described herein should be determining the nature, extent, and quality of our existing water supplies. How can we determine how much we need to conserve or how much we need to find from new sources such as recycling and re-use until we know how much water we have?

I17-377

## Guideline Principles (p. C-1)

### Scenic Landscapes (p. C-1)

**Principle 2: Reinvestment (p. C-2):** Please revise as follows: “Promote reinvestment . . . that enhances *sustainability*, livability and image.” I17-378

**Principle 5: New Town Impacts (p. C-2):** This principle should not be needed because the County should prohibit the development of any New Towns. The space available within our existing cities alone can accommodate all the growth projected through build-out of the General Plan. We have about 40 existing UDBs and new HDBs, not to mention the MSCs. We have no need whatsoever of New Towns. Limiting new development to within current boundaries will do the most to fulfill the people’s priorities of focusing growth in existing developed areas, preserving agricultural and open space lands, and improving air quality and protecting water supply and quality. What does promoting the development of New Towns say about the County’s interest in reinvesting in our existing communities (see Principle 2 above)?  
If the County intends to permit New Towns, **this Principle must be modified** to be more inclusive of impacts that must be limited: “Ensure that new towns or communities are planned and designed to limit their impact on scenic working and natural landscapes, *and on natural and cultural resources, and on air quality, and on water supplies and quality, and on vehicle miles traveled, and on GHG emissions.*” I17-379

## Environmental Resources Management (p. C-2) I17-380

**Principle 1: Natural Resources (p. C-2):** Please revise as follows: “Provide for the *identification, protection, understanding*, and appropriate utilization *and conservation* . . .” The County should be pro-active in the first three areas, and in conservation, as well as utilization. Surely, we intend to leave something for generations to come?

**Principle 3: Cultural Resources (p. C-2):** Much more than “identifying” cultural resources is necessary to “ensure the preservation and maintenance of the heritage of Tulare County. **The cultural resources themselves must be preserved and maintained if our heritage is to be preserved and maintained.**” I17-381

**Principle 4: Natural Lands (p. C-2):** Please modify as follows: “*Ensure* the continued preservation of natural lands *and their natural inhabitants.*” It’s much cheaper and easier in the long run to preserve the habitat necessary to sustain viable populations of native species than it is to go through the requirements of the Endangered Species Act and related legislation. It’s also the right thing to do. Our native species (flora and fauna) provide essential ecosystem services and are important to the beauty of the County, our quality of life, and tourism as well. They are also significant components of “the heritage of Tulare County” (see Principle 3). I17-382

## Air Quality (p. C-2)

**Principle 1: Air Quality (p. C-2):** Please include “construction and building” in the list of programs to improve air quality. Energy and water efficiency in construction and building can significantly affect air quality. | I17-383

**Principle 2: Reduce Pollution (p. C-2):** Please include “construction and building” in the list of practices that contribute to poor air quality; construction and building practices are a major factor in air quality. | I17-384

**Principle 3: Alternative Transportation Modes (p. C-3):** Please revise as follows: “Promote *compact, efficient, multi-use, higher-density infill and concentric* land use patterns and provide alternative travelways (such as bicycle and pedestrian trails and paths, traffic lanes for multi-passenger vehicles only, complete streets, etc.) that support . . . .” | I17-385

**Principle 4: Health, Safety, and Welfare (p. C-3):** This must include cleaner air, reduction of GHG emissions, neighborhoods designed for safety (e.g., CPTED – Crime Prevention Through Design), adequate sewage and wastewater systems, and safe water to drink. | I17-386

**Animal Confinement Facilities Plan (ACFP) Phase I (p. C-3):** Why is the ACFP listed here without any corresponding Principles or Environmental Concepts? These should be supplied, since ACFPs have an enormous impact on Tulare County’s environment, affecting air quality, water supply and quality, GHG emissions (contributing 63% of the GHG emissions in the unincorporated County), public health, and quality of life. | I17-387

**CHAPTER 7. SCENIC LANDSCAPES (GPR p. 7-1 ff)** | I17-388

The County has changed virtually nothing in this Chapter from the 2008 version. It deleted the “Acronyms” section and added “Work Plan” in front of “Implementation Measures” in the fifth bullet on p. 7-1, eliminated “breaking up massing” in the second bullet in SL-1.1 on p. 7-3, changed “Hide” to “Screen” in SL-1.1 on p. 7-3, added a fifth bullet to SL-4.1 (p. 7-7, “Promote highway safety by identifying appropriate areas for traffic pull-outs and rest areas”), added a fourth bullet to SL-4.2 (p. 7-8, “Promote County road safety by identifying appropriate areas for traffic pull-out”), and added a map, “Designated Candidate Scenic State Highways and County Scenic Routes, Figure 7-1,” p. 7-5.

**SL-1.1 Natural Landscapes (p. 7-3):** “The County *may*” is not a clear Policy and does not guide a specific course of action to achieve a goal. Please change to “To this end, the County *shall* require new development to . . . .” | I17-389

Why was “breaking up massing” deleted from this Policy’s second bullet? **Please add to the fourth bullet:** “Include landscaping that screens the development, *utilizing native and drought tolerant plants wherever possible.*”

**Please add to the fifth bullet:** “Limit the impact of new roadways and grading on natural settings, *and re-vegetate*

82

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

*promptly and maintain cuts and fills with native and drought tolerant plants wherever possible.* **Please add this bullet:** “Ensure that all exterior lighting is shielded to minimize light trespass, meeting ‘Dark Skies’ standards. To minimize unnecessary lighting and energy use, exterior lights should be on motion sensors or timers wherever feasible.”

117-389  
cont'd

**SL-1.2 Working Landscapes (p. 7-3-2):** Please add to the second bullet: “Screening and breaking up parking and paving with landscaping, *utilizing native and drought tolerant plants wherever possible.*” **Please add this bullet:** “Minimizing impermeable paving and hardscape in order to reduce runoff and promote groundwater recharge.” **Please add to the third bullet:** “Ensure that all exterior lighting is shielded to minimize light trespass, meeting ‘Dark Skies’ standards. To minimize unnecessary lighting and energy use, exterior lights should be on motion sensors or timers wherever feasible.”

117-390

**SL-1.3 Watercourses (p. 7-3):** The GPR should include a map showing the trails and watercourses currently used for public recreation (and should designate areas reserved for future trails and water recreation) so that it would be clear where the viewsheds are in which the “rural and natural character of landscape” must be maintained.

117-391

**SL-2.1 Designated Scenic Routes and Highways (p. 7-3):** The Scenic Landscapes Element is really inspiring. **Please add this bullet:** “Establishing trail systems within these scenic corridors to encourage their enjoyment by foot, by bicycle, and by horseback.” It would be healthier for the scenery and for the tourists to be enjoying our marvelous landscape outside of their vehicles. This would encourage active tourism with lower GHG emissions and also promote a healthier local citizenry.

117-392

Thank you for providing Figure 7-1, , which had gone missing, but has been restored. Unfortunately, it is very hard to read. Please include some text in SL-2.1 listing and describing the eligible segments of Highways 198 and 190 and the system of County scenic routes. Our County’s scenic routes are some of the most beautiful and accessible in the State, and should be much better mapped, signed, and advertised for the benefit of residents and tourists alike. They are among our County’s greatest resources for recreation, auto and cycle touring, photography, birding, wildlife watching, wildflower sighting, blossom trails, farm trails, and the thrill of visiting the amazing geographical, climatic, and biological diversity of California.

117-393

Also, please cross-reference (in a text box?) C-1.3 “Scenic Corridor Protection Plans” (p. 2-1, Part II Area Plans). **Please explain how these two policies are related. Are they supposed to be doing the same thing? Why are the County’s candidate scenic routes not mentioned in C-1.3? Please make these Policies consistent and strong, with concrete, timely IMs so that these wonderful scenic, sustainable resources will be protected, promoted, and preserved.**

117-394

**Implementation Measure #1 (p. 7-9):** This IM must list a Timeframe. It’s urgent, as Highways 190 and 198 are rapidly losing their scenic qualities due to haphazard development that certainly does not meet the criteria for scenic highway development.

117-395

<p><b>IM#2 (p. 7-9):</b> This IM was scheduled for 2007-2010; now it's moved to 2010-2015. Couldn't the County just modify, simplify, and localize the CalTrans procedures for State scenic highways and adopt them for the County's many scenic routes? <b>What's happened in the last 3 years on this IM?</b></p>	I17-396
<p><b>IM#3 (p. 7-9):</b> This IM was scheduled for 2007-2010; now it's moved to 2010-2015. Same comments as for IM#2 directly above.</p>	I17-397
<p><b>IM#4 (p. 7-9):</b> This IM was scheduled for 2007-2010; now it's moved to 2010-2015. What's happened in the last 3 years on this IM? What does the scenic corridor overlay that exists for roads in the foothills show? <b>Please provide it in the Scenic Landscapes Chapter. What's the difference between the design guidelines in IM#4 and the design review processes in IM#3?</b></p>	I17-398
<p><b>IM#5 (p. 7-9):</b> This IM, the County working with CalTrans on corridor protection plans, is said to be ongoing. What is the status of this IM? Is this the process that will effect IMs #2-4? When is the preparation of these protection plans to be completed? <b>Please include a deadline.</b></p>	I17-399
<p><b>SL-2.3 Historic and Cultural Landscapes (p. 7-4): Implementation Measure #8 (p. 7-10)</b> says the County will work with others to research historic sites and prepare a formal list of cultural and historic resources. This was to be completed in 2007-2010. The timeline has been changed to 2010-2015. <b>What's been accomplished on this list in the last 3 years?</b> Presumably, we have added no new cultural or historic resources in this time. <b>Page 7-1 of the Scenic Landscapes Chapter states that a detailed description of places of important historical, cultural, and/or architectural importance can be found in the Background Report. Indeed, Table 9-3, BR p. 9-57 ff, lists the Historic Properties of Tulare County (2008). So, how much more needs to be done? What will be done with the list once it's completed?</b> Local Chambers of Commerce and historical groups would likely also be good sources of information and might be able to contribute to getting the list published and distributed to tourists and interested residents.</p>	I17-400
<p><b>SL-2.4 New Billboards (p. 7-4):</b> The County shall <i>prohibit billboards</i> and other forms of off-site advertising along scenic roadways and in designated agricultural and open space areas (unless superseded by State law).</p>	I17-401
<p><b>SL-2.5 Billboard Removal (p. 7-6):</b> The County shall <i>seek to reduce the number of billboards</i> along scenic roadways.</p> <p><b>IM#5 (p. 7-9)</b> is for SL-2.4 and 2.5; it says the County will work with Caltrans to prepare corridor protection plans. This implementation has presumably been "ongoing" for a number of years. <b>Please put a deadline on it and get the plans done in order to get rid of the billboards.</b></p> <p><b>IM#9 and #10 (p. 7-10)</b> are to implement SL-2.5, with a timeline of 2020-2030, indicating a very low priority for evaluating amortization rules and exploring means of abating and removing billboards and creating an inventory of billboards indicating any that are inconsistent with County Zoning. Of course, <b>neither evaluating rules and exploring means nor creating an inventory will prohibit or reduce the number of billboards, so neither of these IMs will effect the Policies. IM #9, for SL 2.5 (p. 7-7):</b></p>	I17-402

However, the County might be able to engage volunteer assistance in this inventory process. Various groups interested in beautification and tourism come to mind.	I17-402 cont'd
<b>SL-2.6 Billboard Placement (p. 7-6):</b> The County shall <i>control the placement of billboards</i> throughout the unincorporated County to preserve scenic qualities along major routes. This policy has <b>no IM</b> , so there is no way to know when or how the County will control placement of billboards.	I17-403
<b>SL-3.1 Community Centers and Neighborhoods (p. 7.6):</b> How will the County “support investments in unincorporated communities and hamlets?” The first bullet calls for “Encouraging restoration of existing historic buildings.” How will the County encourage this? How and when will it enhance overall community design frameworks and reduce the need for sound-walls and gated neighborhoods, and plan interconnected neighborhoods with social and physical centers? How will it enhance the comfort and scenic experience of cyclists, pedestrians, and transit riders?	I17-404
<b>IM#11 (p. 7-10)</b> says the County “Shall update its Land Development Regulations and Zoning Ordinance consistent with the policies described herein.” This IM was scheduled for 2007-2010. Now it’s scheduled for 2010-2015. What’s happened in the last three years with these updates? How will they “encourage” restoration?	I17-405
<b>IM#12 (p. 7-10)</b> says the County will work with others to add “design elements” to community plans and specific plans. This IM is shown as “ongoing.” What are the “design elements? In what community plans and specific plans have they been added? Where can the results be seen?	I17-406
Unfortunately, Policy SL-3.1 and its IMs are much too vague and weak to be relied on to accomplish anything.	I17-407
<b>SL-3.2 Urban Expansion – Edges (p. 7-6):</b> This important Policy says that the County “shall design and plan” to protect scenic qualities by maintaining urban separators and protecting important natural, cultural, and scenic resources in areas that may be urbanized in the future.  But its IM (#13, p. 7-10) says only that the need for urban separators will be “considered” when new or updated plans are created. The IM is weaker than the Policy. The County should map and designate and preserve these separators now, before it’s too late. Please revise as a minimum as follows: “Whenever new . . . urban separators <i>shall be designated and maintained</i> as part of the process.”	I17-408
<b>SL-3.3 Highway Commercial (p. 7-7):</b> Policies such as this one that “require” by “encouraging” and “discouraging,” with exceptions and no meaningful IMs (IM#11 and #12 on p. 7-10, as discussed above) cannot be relied on to effect any worthwhile goals.  Please clarify and strengthen SL-3.3 and its IMs to prevent sprawl development along scenic roadways and frontage roads. Developing regional growth corridors will work against compliance with AB32, SB375, the	I17-409

County's Climate Action Plan, the County's rural and scenic character, community character and identity, urban separators, and many other key goals and concepts of the GPU.	I17-409
<b>SL-3.4 Planned Communities (p. 7-7):</b> Planned communities must be allowed only within existing UDBs and HDBs which have the infrastructure to support them and the desire to host them. Development on ridgelines and hilltops must be prohibited, and light trespass must be prohibited if we are to have any hope of preserving our scenic landscapes. <b>Flexibility regarding worthy goals and policies provides no way to enforce them and thus promotes widespread non-compliance.</b>	I17-410
<b>We strongly urge the County to adopt and uniformly and universally implement a "Dark Skies"/light trespass ordinance.</b> The language and specifications are readily available, and many jurisdictions have already implemented such ordinances. Minimizing light trespass is not only essential to maintaining visual access to one of our greatest (and absolutely free) resources (our spectacular night sky), it is also important to being a good neighbor, to protecting night habitat for wildlife, and to conserving energy, and thus reducing GHG.	I17-411
<b>ERM-5.18 "Night Sky Protection" (p. 8-17) does not suffice:</b> it is a piecemeal approach that ignores the facts that a concerned public has already demonstrated the interest, energy-efficiency is an extremely important issue that the County must firmly address, and the BMPs have already been determined. (The only IMs for this Policy are #11 and #12 on p. 7-10, discussed above.)	I17-412
<b>SL-4.1 Design of Highways (p. 7-7):</b> Please add to the fourth bullet: "Avoiding excessive cut and fill for roadways . . . and promptly re-vegetating cut and fill areas with native, drought tolerant plants." Thank you for adding the new fifth bullet, although it does not completely fulfill our request in our 2008 comments (which were: Please add this bullet: "Providing identified wayside pullouts and rest areas with parking space and interpretive signage to enhance attractiveness and safety of our roads, encourage travelers to learn about the area's natural and cultural history and attractions, and allow safe opportunities for photography, picnicking, resting from driving, and (on smaller roads) allowing other vehicles to safely pass").	I17-413
<b>SL-4.2 Design of County Roads (p. 7-8):</b> Thank you for adding the new fourth bullet (with same comment as above for SL-4.1).	I17-414
<b>8. ENVIRONMENTAL RESOURCES MANAGEMENT (GPR p. 8-1 ff)</b>	I17-415
<b>Key Terms</b> "Major Waterway. Any navigable body of water." This key term was in the 2008 version, but does not appear on p. 8-2 of the 2010 version. Please restore it, as a major waterway is certainly an environmental resource.	

<b>Ridgeline (p. 8-2): Please correct this definition.</b> A ridgeline is not a chain of hills or mountains. It is “a line marking or following a ridge top, the crest of a ridge.”	I17-416
<b>Sensitive Natural Community (p. 8-3): Please add</b> that in Tulare County riparian areas must be considered in this category since they are regionally rare, only 0.34% of the County.	I17-417
<b>Vernal Pools (p. 8-3):</b> In the second sentence, “session” should be “season.”	I17-418
<b>Williamson Act (p. 8-4-3): Please revise as follows, because as written (showing agricultural production only) this paragraph is quite misleading:</b> “This act allows property owners to have their property assessed on the basis of agricultural production <i>or open space uses such as scenic highway corridor, wildlife habitat area, or recreational area</i> , rather than current market value. The purpose of the Act . . . continue to use their property in agricultural <i>or open space</i> activities to prevent . . .”	I17-419
<b>Existing Conditions Overview (p. 8-4 ff):</b> Several resource categories are mentioned here. The County’s scenic resources are only implied by some of the remarks that follow. Since these resources are among the foremost in the County that must be protected and preserved, they should be mentioned, or the reader should be referred to the Scenic Landscapes section. Another of the County’s foremost resources, its <b>rich and productive soils</b> , is not mentioned here, although the soil has proven much more valuable to the County than its mineral resources, which are listed and given a paragraph. The reader should be referred to the Agriculture section and to ERM-7; our soil resources certainly merit a mention and our careful consideration	I17-420
<b>Basic Components of the Environmental Resources Management Element (p. 8-6 ff):</b> In the first sentence, “complimentary” should be “complementary.” In the second sentence, the verb should be “deals,” not “deal” (the subject is “each”). <b>Please clarify the third sentence; it is too vague to be meaningful.</b> It says that the plans for open space and conservation “emphasize the approach of making use of existing land use trends.” <b>What are these existing land use trends? What is meant by “making use of them?”</b> What is meant by “providing guides which will encourage land uses that will lead to achievement of these plans?” <b>What kind of guides? What kind of land uses?</b> It says it will “use existing regulations, or only slightly adjusted regulations, to achieve the bulk of these plan requirements.” <b>What are these existing regulations, and where are they found? Are they already achieving the plans for open space and conservation (so that they require only slight adjustments)? Which plan requirements will be achieved?</b>	I17-421
<b>Open Space (p. 8-6):</b> The second sentence of this paragraph says, “Open space . . . is an expression of the use of open space in conserving, protecting, and enhancing the environment of Tulare County.” <b>What does this mean? Open space is an expression of the use of open space?</b>	I17-422

Open space which can be graphically portrayed is shown on the map entitled “Plan for Open Space” (Figure 8-1, p 8-7. The map is called a plan, but what is the plan? The map broadly depicts Extensive Agriculture, National and State Open Space Land, Intensive Agriculture, Urban Expansion, Flood Plains, Mountain Service Centers, Tule River Indian Reservation, Cities, Lakes, Streams, Trails, Townships, Windsheds, Railroads, Power Transmission Lines, and Airports. Tiny letters below say “Content: Open Space for Urban Use, Water Preservation, Recreation, Scenic Corridors, Agriculture, Public Safety, Water Recharge Areas.” Where and how are these “Content” designations depicted on this map?

I17-423

The next paragraph says that the “Plan for Open Space locates *proposed trail systems*, airport clear zones, flood prone areas, agricultural lands, urban lands, State and Federally owned resource protection lands, *suggested scenic corridor routes*, important waterways, the Tule Indian Reservation, and areas designated as wind-sheds (*within which uses should be carefully studied so as not to adversely affect the air resources within urban areas*).” It then says that “*at the scale of this map, it is impossible to designate precise boundary lines for the different areas*,” and that “*detailed designations are reflected through zoning ordinances which reflect the policies of this element*.” The County should state right here what those ordinances are and what they say, and it must provide a series of detailed maps to show where those “precise boundary lines for the different areas” are.

I17-424

The County doesn’t have jurisdiction over the National and State Open Space Land or the Tule River Indian Reservation. The maps depicting the Plan for Open Space need to show the areas over which the County can exercise control. What is the Plan for Open Space? Is it a separate document? Does it already include detailed maps showing the “agricultural, recreation, scenic, watershed, ground water recharge, and wildlife habitat lands” and the “areas necessary for protection and enhancement of the environment” and the “proposed trail systems” and “suggested scenic corridor routes” and “important waterways?” For Open Space to be presented “through graphics,” as stated in the first Open Space paragraph, maps showing this information must be provided in the GPU documents.

I17-425

The first paragraph (“Basic Components”) says that the “Plan for Open Space” is “a generalized system-plan which serves as a guide and draws attention to those areas discussed in the narrative section as areas necessary for protection and enhancement of the environment.” What is meant by “a generalized system-plan?” What system? If the Plan serves only as a guide drawing attention to areas, to encourage certain uses, how does it provide any certainty that “the bulk of these plan requirements” will be achieved?

I17-426

The third paragraph under Open Space (p. 8-6) says that “policies are important to the implementation of this plan . . . and such policies and recommendations should be regarded as a basic part of the Plan for Open Space.” Which policies and recommendations are being referred to here? Are they in the Plan for Open Space? Are they in the zoning ordinances?

I17-427

The fourth paragraph under Open Space (p. 8-6) says that the Plan for Open Space “recognizes and plans for *implementation of the fundamental concepts that the preservation of open space lands is necessary* not only for the maintenance of the economy of the State, but also for the assurance of the continued availability of land for the production of food and fiber, for the enjoyment of scenic beauty, for recreation, and for the use of natural resources.” So, the Plan “*plans for implementation of concepts.*” **It would be far better if the Plan served to preserve open space lands.**

I17-428

The Plan (fourth paragraph under Open Space, p. 8-6) “discourages” *“premature” and “unnecessary”* conversion of open-space lands to urban uses “*as a matter of public interest.*” **The implication here is that open-space lands will all “mature” to urban uses, and that conversion to urban uses is “necessary.” Why shouldn’t important open-space lands be permanently preserved? In many cases their highest and best use is certainly not urbanization – and urban dwellers will not have food, fiber, scenic beauty, and the use of natural resources without their preservation. Of course, open-space lands also must be permanently preserved because all terrestrial life depends on them. We certainly cannot live without them, and so we must ensure sufficient permanent preservation of them to secure the maintenance of their ecosystem services, on which we are utterly dependent. The GPU/RDEIR repeatedly fails to “recognize and plan for” this “fundamental concept.”**

I17-429

The Plan (fourth paragraph under Open Space, p. 8-6) “will benefit urban dwellers by *discouraging noncontiguous development patterns which unnecessarily increase the costs of community services* to community residents.” **Noncontiguous development is not only inefficient and unnecessarily costly, it also works against compliance with AB32, SB375, and the County’s Climate Action Plan.**

I17-430

Policies that “encourage” and “discourage” and “support” and “cooperate” and “promote” and “should” and “make efforts” predominate in the ERM Chapter, and they are to be implemented by measures that are frequently equally vague and weak (“encourage and support,” “if feasible and needed,” “actively pursue,” “continue efforts,” “develop a list,” “promote a program,” “devise procedures,” “establish criteria,” “should initiate,” “should consider,” “should establish”—except where they repeat requirements of, for example, State or Federal law), often with timelines going out 10 years, or shown as “ongoing.” **These Policies and Implementation Measures cannot be relied on, measured, or enforced; they will not serve as mitigating policies and implementation measures for the RDEIR.**

I17-431

**Conservation (p. 8-6):** This paragraph says there are many policies designed to *conserve resources through “careful” development and “appropriate” utilization of the resources integrated with multiple uses* where possible, and that protection and utilization of resources for recreation and open space will result in their conservation.

I17-432

Where on the Tulare County Plan for Open Space Map (Figure 8-1, p. 8-7) are the areas designated for “protection and utilization of resources for recreation and open space that will result in their conservation?”

I17-432  
cont'd

The first paragraph on p. 8-9 says that “conservation of species is provided for in the many *recommendations* for preservation of wildlife habitat, as well as *provision for* new areas for this use.” How will a *recommendation* preserve wildlife habitat? A recommendation is not a Policy. Which are the Policies that “provide for” new habitat preserves, and will these Policies actually ensure preservation of land for this purpose? What is meant by “recommendations for conservation of the *diversified life style environments* and *economic aspects* of Tulare County? What are *diversified life style environments*??? What *economic aspects* are being referred to? What are the recommendations, and where are they? Are these “recommendations” supposed to serve as Policies? What will be there force and effect? Do they have any Implementation Measures?

I17-433

Recreation (p. 8-9): “This plan is provided for all socio-economic levels and in diverse locations so that everyone may have accessibility.” Presumably, this sentence is meant to imply that Tulare County provides open space recreational opportunities convenient to all of its residents, even those who can’t afford to go very far to get to public open space. Recreation and park sites are cited as open space, “so that they can be considered as implementation devices for a part of the Plan for Open Space.” Since the County owns and operates only 13 park and recreation facilities for a population of about 160,000 people in the unincorporated County (many of which also serve the incorporated cities’ population of over 300,000), and since the County is not proposing any new parks due to budget restrictions for their operation (BR, p. 4-3), and since the existing parks comprise less than 700 acres, it is clear that they cannot be counted as a significant “implementation device” for the Plan for Open Space.

I17-434

This paragraph (p. 8-9) goes on to say that “the more related uses that can be found for a land parcel, the easier its preservation and conservation can be justified . . . land use for economically sound purposes has a higher probability of remaining in open space use.” The County must make sure when it values its land use “for economically sound purposes”, that it is properly accounting for the value of its natural capital and ecosystem services. What is the economic value of recharged groundwater? What is the economic value of cleaner air? What is the economic value of carbon sequestration? What is the economic value of a healthier population? What is the economic value of running rivers and snow-capped peaks? Perhaps it would help to look at the costs of NOT having open space and its ecosystem services. What would be the costs of having to import most of our food and most of our water? What are the costs already to the County due to its terrible air quality (missed school, lost productivity, crop damage, emergency room visits, long-term disease, etc.)? What are the costs of lost forests, lost grasslands, lost farmlands? What are the physical and spiritual costs of lost open space, lost vistas, lost wildlife, the loss of a sense of freedom and open space to explore, where there is respite from the noisy and artificial urban environment and contact with the natural world? What is the cost of not being good stewards of the creation that has always sustained us and on which we are totally dependent? The GPU documents had better

I17-435

show this cost/benefit analysis and how it determines the designation of significant open space areas and the establishment of protective zoning. Its economic analysis is currently far too limited and short-sighted.

I17-435  
cont'd

Most of this section on the Basic Components of the ERME, starting on page 8-6, is written in such a vague, convoluted, and veiled style that it seems to be designed to confuse and mystify the reader. Compare it, for example, with the language in the Open Space Element of Sonoma County's General Plan: "State law recognizes that open space land is a limited and valuable resource which must be conserved wherever possible. The element must address open space for the preservation of natural resources, for the managed production of resources, for outdoor recreation, and for public health and safety. The purpose of the Open Space Element is to preserve the natural and scenic resources which contribute to the general welfare and quality of life for the residents of the county and to the maintenance of its tourism industry. . . . The Open Space Element has three major components, a policy framework for the preservation of open space lands, an open space map for each planning area identifying the lands subject to the various policies, and an implementation program. There are four classifications of open space -- scenic resources, biotic resources, outdoor recreation, and archaeological/historical resources. The unique quality of Sonoma County results from the attractiveness and diversity of its landscape. The scenic resources component includes three open space categories, community separators, scenic landscape units, and scenic highway corridors." This language is clear, direct, and designed to inform the reader. Please rewrite the Basic Components of the ERME section (pp. 8-6 – 8-9) to achieve the same results in this part of the GPR.

I17-436

## 8.1 Biological Resources (p. 8-9 ff)

The Policies and Implementation Measures in this section must include the likely continuing and accelerating impacts of global climate change on habitats, biodiversity, and ecosystems in the County and must show how the Policies and IMs are considering both current conditions and likely trends in determining suitable actions and timelines. This section must also consider the impacts of its Policies and IMs on global climate change.

I17-437

ERM-1.1 Protection of Rare and Endangered Species (p. 8-9) and Implementation Measures #1-#7 (pp. 8-21 and 8-23): The problem with this fine-sounding Policy and its Implementation Measures is that while the wording of the Policy implies proactivity, the IMs for the Policy are almost entirely only reactive, dealing with the activities of protection only on a haphazard, piecemeal basis as sites come up for project development, which will do very little to carry out the stated intent of the Policy (protection of wildlife and plant life, especially that which is rare, threatened, or endangered cannot meaningfully occur on a fragmented, piecemeal basis, as it is primarily habitat-dependent, and protecting disconnected small oases of fragmented habitat will not ensure protection of viable populations of species). If the County truly means to ensure protection of its native plants and animals, it must proactively identify, protect, and preserve habitat areas sufficient to sustain them before it's too late (factoring in the impacts of global climate change as well).

I17-438

91

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

**IM #1- Encourage and Support Education (p. 8-21)** is a good goal, but does not say how it would do so, rendering the IM too vague to be meaningful or enforceable. Please correct this deficiency.

I17-439

I17-440

**IM #5 – Develop a Joint Study (p. 8-21)** is a good start, but it does not state what will be done once the study is completed, which would be the real implementation. Additionally, habitat must be preserved not only for the survival of rare and endangered species, as required by law, but also to ensure that native populations do not become rare and endangered. How will the “quantity of demand” be determined? How far into the future will it be projected? Will the likely continuing and accelerating impacts of global climate change be factored in to the amount of habitat that must be preserved? How will loss of habitat lands affect global climate change?

Much of the information needed for this study is already available, waiting to be compiled from various sources (Fish and Game, Fish and Wildlife, Native Plant Society, Natural Resources Conservation Service, Center for Biological Diversity, etc.). Furthermore, much of the habitat needing to be protected and preserved is immediately obvious and is already very rare and endangered itself, so that time is of the essence in completing this study and acting upon it. This IM had a timeline of 2007-2010 in 2008. Now it's 2010-2015. Five more years may be too late for many of these key habitat areas. Please go for 2012 at the latest.

**NOTE: Table 9-1 Habitat Types of Tulare County (BR p. 9-11)** has been very substantially modified in the 2010 version (see BR p. 9-9 in the 2008 version). What accounts for these very large changes in Acres and Percents? The source for the 2010 data is given as “CDF, 2002.” No source or date is given in the 2008 version. How can this information be considered reliable when it is so drastically different in two years (e.g., a loss of @4500 acres of Alpine Habitat – the great majority of this Habitat, a more than doubling of Annual Grassland, an almost doubling of Chaparral, a loss of well over 140,000 acres of Hardwood Woodland, Riparian habitat cut in half, Urban more than doubled)? Please explain and verify this information. Are Policy decisions being made on this basis?

I17-441

Tulare County, per the current Background Report (p. 9-11), is only 0.34% Open Water (0.17% Lake in 2008), only 0.61 % Wetlands (0.21% wetlands in 2008), and only 0.15% Riparian (0.34% riparian in 2008). These percentages, of course, used to be hugely greater, when Tulare County just 150 years ago hosted the largest fresh water lake west of the Mississippi, vast Valley oak forest, and extensive riparian and wetlands. The painfully few watery areas in the desert floor of our valley are absolutely critical habitat and corridors for native plants and animals, and very important for humans as well. The County should preserve and sustain these key environments for all of us who depend on them, for flood protection, for groundwater recharge, for tourism, for recreation, for scientific study, for cleaning and cooling the air, for cleaning runoff water, and for themselves. The alpine habitat 0.04%

I17-442

(0.18% in 2008) is already protected federal land . <b>Quite certainly, all of these areas have already been mapped and GISed.</b>	I17-442 cont'd
<b>We already have</b> (or should very shortly have, as in the case of long-overdue developer impact fees) the means to preserve these tiny remaining portions of our natural heritage, through the California Land Conservation Act (Williamson Act), the Quimby Act, the Oak Woodland Conservation Act, developer impact fees, zoning, mitigation programs, etc.	I17-443
<b>Please prioritize this study and state how and when its results will be used.</b> One of its products should be a comprehensive County biodiversity map, with overlays for all of our sensitive, significant, rare, threatened and endangered species and habitats (including wildlife corridors), plus existing and other suitable recreational resource lands. This map should guide all land use decision-making, to ensure protection and preservation of these almost-vanished resources.	I17-444
<b>IM #7 Resource Conservation Areas (p. 8-23) should indicate what the “existing provisions” within the Zoning Ordinance are.</b> Please see comment on IM #5 directly above for areas that can be identified immediately as in dire need of being designated as Resource Conservation Areas to protect them as habitat. <b>Please explain why, if these provisions already exist, we are showing a timeline of 2015-2020 (was 2010-2015 in the 2008 version) for implementing them.</b>	I17-445
<b>Please provide concrete, trackable implementation measures with a timeframe of 2010-2012 for this very critical and time-sensitive IM.</b>	
<b>ERM-1.2 Development in Environmentally Sensitive Areas (p. 8-9): Please add to the second sentence:</b> “Development in natural habitats . . . to minimize erosion <i>and disturbance of natural watercourses, water bodies, and drainage systems</i> , and to maximize beneficial . . . .” <b>This Policy should also require <u>at least</u> 1:1 mitigation for any development allowed in sensitive habitat areas.</b>	I17-446
<b>ERM-1.3 Encourage Cluster Development (p. 8-9):</b> This Policy should mandate cluster development to preserve not only sensitive habitat potential, but open space in general. This could help in meeting the people’s priorities and also in complying with AB32, SB375, the Blueprint, and the County’s Climate Action Plan. <b>No IM is shown for this Policy</b> to tell what methods the County would use to encourage cluster development, which is unlikely to occur on the basis of “encourage” alone.	I17-447
<b>LU 3.2 (p. 4-27) and IM # 19 (p. 4-36) address cluster development in an equally vague and unmeasurable manner.</b> (Likewise, Policy HS-6.4 Encourage Cluster Development, p. 10-10, says that the County shall “encourage” cluster developments in areas subject to high fire hazard, but gives no idea how the County would do this and provides no IM.)	I17-448
<b>Please provide concrete Policies with measurable, enforceable IMs and timelines for requiring cluster development as a condition of any development permitted in sensitive habitat areas.</b>	

**ERM-1.4 Protect Riparian Areas (p. 8-9) and Implementation Measures #5 (p. 8-22) and #7, #8, and #9 (p. 8-23):** Given global climate change, the County's impending water crisis, the extreme need for groundwater recharge, the need to comply with AB32, wildlife requirements, recreational opportunities, the importance of scenic landscapes, and the people's priorities, this is an extremely important Policy that must be implemented comprehensively and very promptly. Per the Background Report (p. 9-11), **only 0.15% of Tulare County is riparian.** Much of this tiny remaining percentage is already degraded. This is an increasingly essential, increasingly endangered resource.

I17-449

**Unfortunately, IM#5 is only "to develop a joint study."**

**IMs #7 and #8, to designate Resource Conservation Areas and develop and administer a mitigation banking program, are now timed for 2015-2020 (the timeline was 2010-2015 in 2008), which is incomprehensible given our water emergency and given that IM #7 states that the County has existing Zoning Ordinance provisions to designate Resource Conservation Areas to protect habitat. It is astonishing that the County should qualify IM #8 with "if feasible and needed," ignoring the fact that mitigation banking programs are already well-established and functioning to preserve and protect natural resource lands in many other jurisdictions. The County has been urged many times over the last several years to implement a mitigation program and certainly has the means to do so in the immediate future.**

**Please change the timelines on IM #7 and IM #8 to 2010--2012. Please make concrete and measurable the steps that the County will take in this timeframe to effectively protect our almost-vanished riparian areas (for example, set annual goals of riparian acreage to be permanently protected, with a meaningful total goal to be achieved, and a monitoring and reporting program that allows the public to review annually the effectiveness of this program).**

**ERM-1.5 Riparian Management Plans and Mining Reclamation Plans (p. 8-9) and IM #7 (p. 8-23):** Please apply comments above on ERM-1.4 to ERM-1.5 also. The sole IM for this Policy has to do with the County designating Resource Conservation Areas in **2015-2020; please clarify the applicability of the IM to this Policy, and move the Timeframe forward to 2010-2012.**

I17-450

**Please make this Policy and its IM concrete and measurable. Please state what measures must be included in the plans, how they will be implemented and monitored, and when this will be required.**

**Please explain how this is related to the County's Zoning Ordinance provisions to designate Resource Conservation Areas. Since most of the mining in the County takes place in riparian areas, it is extremely important that these areas be protected and restored as well-functioning habitat. Restoration must be required throughout the mining process in order to minimize habitat loss.**

<p><b>ERM-1.6 Management of Wetlands (p. 8-10) and IMs #5, #6, #7, #10, #11 (pp. 8-22 and 8-23):</b> Given global warming, endangered and threatened species and habitat, the County's impending water crisis, AB32, and the people's priorities, this extremely important Policy must be implemented comprehensively and very promptly. <b>Please clarify and strengthen this vague ("support" preservation) Policy and its IMs.</b> Per the Background Report (p. 9-11), <b>only 0.61% of Tulare County is wetlands.</b> This is a tiny fraction of the wetlands areas that once so enriched our County. The Background Report states (p. 9-4) that wetlands provide habitat for many plants and animals and are essential in preserving the quality of surface waters and in recharging groundwater aquifers.</p>	I17-451
<p>The joint study in <b>IM #5</b> is important; it is very likely that <b>most of this information is already available</b> from Fish and Game, Fish and Wildlife, Natural Resources Conservation Service, the Center for Biological Diversity, etc. <b>IM #5 should state how the study will be used.</b> Please see the comments above (with ERM 1.4) on IMs #7 and #8.</p>	I17-452
<p><b>IM #10</b> shows a 2015-0-2020 timeline for pursuing a program for vernal pools; <b>please change this to 20010-2012</b>, because these pools are highly threatened (the Background Report, p. 9-28, states that vernal pool ecosystems are considered one of the most threatened ecosystems in California, often occurring on relatively flat terrain, and highly vulnerable to destruction from agriculture, heavy grazing, urbanization, brush clearing, and off-road vehicle use). Admirably, IM #10 says that the County shall actively pursue acquisition or preservation of vernal pools, BUT not until 2015-2020, by which time many more will have been irretrievably lost. Since <b>conservation easements and trusts are already available instruments</b> in the County, the County should <b>define</b> concretely what it means by "actively pursue" and begin preserving these pools right away. Why can't the County work right now with our local land trust to acquire or preserve this threatened ecosystem? <b>Please establish a mitigation banking program well BEFORE 2013, along with developer impact fees.</b></p>	I17-453
<p><b>IM #10 should be revised to state</b> a minimum number of acres of vernal pool ecosystems that the County will commit to acquiring or preserving before 2012 and <b>should establish an ongoing annual goal for their preservation, the achievement of which will be monitored and measured, with the results available annually for public review.</b></p>	I17-454
<p><b>IM #11 Wetland Preserves (p. 8-23) must be made clear, concrete, and enforceable.</b> It should state what the County's current efforts are to maintain and enlarge wetland preserves. <b>It should as a minimum set specific annual goals for additional acreage to be set aside for wetland preserves to maintain the flyway route.</b> It should recognize that, beyond their importance to habitat, such preservation areas can be <b>very attractive to tourists</b>, especially the ever-growing numbers of bird-watchers. <b>Please revise its current second sentence to "Such wetlands shall also . . ."</b> Then state in concrete terms, with <b>measurable implementation objectives</b>, how the County will protect these preserves through the programs listed.</p>	I17-455

**ERM-1.7 Planting of Native Vegetation (p. 8-10) and IM #12 (p. 8-24):** This Policy would be good not only for native plants and the wildlife dependent on them, but also for maintaining the natural character of Tulare County, and, very importantly, given our impending water crisis, for reducing water use, as native plants will typically need no irrigation once established.

I17-456

**Please change “encourage” to “require,”** especially in the case of developers. If the County insists that it cannot require anything because it needs flexibility, then require a percentage only, such as 80% (after all, Las Vegas is allowing no more grass front yards and is paying homeowners to rip out their thirsty lawns and plants and replace them with natives).

**The Implementation Measure (#12), developing a list of native vegetation to be used** (already currently available from the Native Plant Society, local nurseries, and numerous other sources), **is not likely to significantly increase the planting of native vegetation,** since that information is already widely available. **To promote water conservation and achieve measurable increases in such planting, the Policy and the IM must be strengthened** and should include specific annual goals for native planting.

**ERM-1.8 Open Space Buffers (p. 8-10) and IM #9 (p. 23):** In the first sentence, “significant” should be clarified. In Tulare County, EVERY instance of riparian vegetation and wetlands is significant because they are so rare and important. Additionally preserving natural watercourses is very important for runoff management, flood control, and groundwater recharge; these watercourses should be preserved also as natural features, providing relief in a largely flat landscape in the valley. Please revise the second sentence in the Policy: “These buffers *shall* be sufficient . . . .” The IM is unclear when it says that the buffers will be public open space. Does that mean that the buffers will be open to public access? If so, they will need to be larger in order to accommodate human activity in addition to their function for preservation.

I17-457

**ERM-1.9 Coordination of Management on Adjacent Lands (p. 8-10):** This Policy has been modified in the RDEIR (p. ES-10, etc.) by the addition of new text. After “preserve and protect biological resources,” new text has been inserted as follows: “including those within and adjacent to designated critical habitat, reserves, preserves, and other protected lands.” No explanation is given for this change and the change has not been made in ERM-1.9 in the GPR, where no indication is given that the text has been modified in the RDEIR. What is the intent of the additional text? Does it mean to limit where the County will “work with” others to preserve and protect resources? Why has the change been made? How and when will the County “work with” other government land management agencies to achieve preservation and protection? How will the results of the County’s efforts be measured? Does the addition of the new language intend the meaning that the County will work to maintain “*the ability to utilize and enjoy the natural resources in the County*” even if they are designated as critical habitat reserves, preserves, and other protected lands? This Policy is far too vague and ambiguous to serve as a mitigating Policy for the RDEIR, and it has no Implementation Measure, although it certainly needs one.

I17-458

96

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

**ERM-1.10 Appropriate Access for Recreation (p. 8-10) and IM #13 (p. 8-24):** Here is another example of a Policy to “encourage” to be effectuated by an Implementation Measure to “encourage.” How will the County “encourage?” The interesting part here is that, per IM #13, the County “shall classify and preserve private lands which are prime timber lands and reserve them for that use . . . .” **How can the County do this? If it can preserve private timber lands and reserve them for timber, then can it also preserve private wetlands and riparian areas and other key habitat areas and reserve them for ecological purposes? Please clarify, and apply to other critical resource lands if in any way possible.**

I17-459

**ERM-1.12 Management of Oak Woodland Communities (p. 8-10) and IM #14-16 (p. 8-24):** The Policy should be clarified because “support” is too vague.

I17-460

**IM #14** says “the County shall ensure the provisions of PRC 21083.4 [The California Oak Woodland Conservation Act of 2001] are followed when evaluating projects in woodlands.” The Oak Woodland Conservation Act grew out of concern at the extensive loss of these woodlands to development, firewood harvesting, and agricultural conversions, because oak woodlands moderate temperatures, reduce soil erosion, facilitate nutrient cycling, sustain water quality, enhance natural and scenic beauty, enhance the monetary and ecological value of real property, promote ecological balance, and provide habitat for about 5,000 insect species, 160 bird species, and 80 mammal species, according to the University of California (this is not to mention their value for tourism and hunting and fishing interests). The Act established an Oak Woodland Conservation Program administered by the Wildlife Conservation Board, which is authorized to purchase oak woodland conservation easements and provide grants for land improvements and oak restoration efforts; its intent is to support and encourage *voluntary*, long-term private stewardship and conservation of these woodlands through financial incentives and to encourage planning that is consistent with oak woodland preservation. Twenty percent of the money may be used for public education and outreach by local governments and others and for grants to provide technical assistance and to develop and implement oak conservation elements in a general plan.

I17-461

**To qualify for funding, the county (or city) must have adopted an Oak Woodland Management Plan;** grant proposals may come from private landowners, local government entities, and others, but the County (or city) must certify that proposed grant requests are consistent with its adopted Oak Woodlands Management Plan. Thus, **IM #14 is meaningless unless the County has adopted an Oak Woodlands Management Plan (OWMP), but the County has not done so, despite urging from individuals and groups such as Tulare County Citizens for Responsible Growth (TCCRG), the Audubon Society, the California Oak Foundation, and Sequoia Riverlands Trust (SRT). TCCRG and SRT even offered in 2009 to write the OWMP for the County.**

**IM #15 (p. 8-24)** states that the County (in 2015-2020, which is outrageous, since it was 2010-2015 in the 2008 version) “shall work with stakeholders to determine the feasibility of adopting an oak woodlands

I17-462

97

management plan pursuant to the . . . Act.” This is a poor replacement for the related IM in the 2007 draft of the GPR (#13 on p. 8-17), which said that the County “shall protect oak trees throughout the foothill and mountain areas. Preservation methods may include agreements with the owner, conservation easements, and purchase of the property by the County or other organization such as the Sequoia Riverlands Trust”; that IM was indicated as being ongoing. Of course, the County should also be protecting oak trees in the valley, but at least in the last iteration it was committed to an ongoing effort, not to just a feasibility study sometime in the next 10 years. Here is a clearly “economical” preservation opportunity. The stakeholders have spoken. An OWMP is clearly feasible. Half the counties with extensive oak woodlands have already adopted plans and are enabling their landowners to apply for millions of dollars in State funding..

I17-462  
cont'd

**Please change the IM #15 Timeline to BEFORE 2011.** In IM #13, the County is preserving prime timber lands and reserving them for that use. The County should be preserving prime oak woodlands and reserving them for habitat and their multiple other beneficial uses as described in IM #14 comments directly above. This is an important step to take in the effort to comply with AB32, to help to mitigate global warming impacts, to comply with the County's Climate Action Plan, and to meet the people's priorities. **The Board of Supervisors stated at their July 7, 2009 meeting, after hearing a report by RMA and comments from the public on the OWMP, that the OWMP was important. Supervisor Cox stated that the Board would push this as one of the first items to be done as soon as the planners passed off the GPU. Supervisor Worthley said that at the soonest opportune moment, which could be even before the GPU is finished, RMA should make an OWMP a top priority. Let's actually accomplish something for conservation and open space, Tulare County. Let's get an OWMP done before 2011.**

**Any reduction of natural oak woodland should compel mitigation on at least a 1:1 basis of preservation of equivalent oak woodland.** Planting oak seedlings somewhere will not suffice to mitigate loss of mature oak woodland.

**IM #16 (p. 8-24) states that the County “shall establish a program to require replacement planting of native oaks” when development projects propose to alter oak woodlands. Where and how will this program be established? It would be far better for the County to prohibit any extensive development in oak woodlands; they should be largely preserved due to their value as stated directly above in comments on IM #14 and #15. Any development in oak woodlands should be required not to disturb any oaks over a certain diameter and to preserve as many oaks as possible. An oak seedling, if it lives, takes dozens of years to grow to a size sufficient to provide the benefits of a mature tree. While replacement planting must be required when oaks in a woodland must be removed, replacement planting is no substitute for avoidance of oak disturbance in the first place.**

I17-463

Please clarify what kind of program the County means to establish, and make it much stronger than this vague and weak IM. When projects propose to alter oak woodlands, project applicants must be required to mitigate on at least a 1:1 basis with preservation of equivalent oak woodland.

I17-463  
cont'd

ERM-1.13 Pesticides (p. 8-10) and IM #17 (p. 8-24): Please amend the Policy statement to: "The Tulare County . . . *shall* cooperate . . . in evaluating the side effects . . . to limit effects on natural resources *and on humans and wildlife.*"

I17-464

This Policy should also address the requirement to cooperate in evaluating and regulating the significant GHG emission impacts of pesticides. Most pesticides contain VOCs, which evaporate from fields and are a key component of ozone, our most abundant air pollutant. Per the Department of Pesticide Regulation, fumigants are responsible for about half of the San Joaquin Valley's pesticide emissions. They are highly toxic gases that contain high concentrations of smog-forming compounds and can have neurological and reproductive effects when inhaled. The fumigant methyl bromide damages Earth's protective ozone layer, contributing to global warming and causing international concern. More than 700 pesticides contain VOCs. Overuse and misapplication of pesticides causes or allows these highly toxic chemicals or drift off fields or seep into groundwater, adversely affecting health. Ninety percent of pesticides used in California are prone to drift. Exposure to pesticides is linked to short- and long-term effects including headaches, dizziness, skin rashes, asthma, reproductive harm, acute poisoning, and cancer. Tulare County used more than 17.5 million pounds of pesticides in 2005, the third highest use of any County in California. Over 50% of Tulare County's public schools are located within ¼ mile of agricultural operations.

Sequoia and Kings Canyon National Parks have found that fish in their high Sierra lakes carry a burden of pesticides and metals, including current-use pesticides from the Valley likely brought up by wind patterns. In a study of airborne contaminants in twenty western national parks, reported in 2008, Sequoia and Kings Canyon were found to have the highest level of current use pesticides of all the parks studied. Measurable levels of current use pesticides or banned pesticides were evident in snow, lake sediment, fish tissue, vegetation, and/or air. This information should be included in ERM 1.3, and in the Background Report and the RDEIR and addressed under CEQA by the RDEIR.

IM #17 (p. 8-15) should be amended as follows: "The County shall continue . . . the inappropriate application of pesticides, *herbicides, or other chemical controls.* This *shall* include damages . . . impregnated with pesticides or herbicides *or other chemical controls* which are . . . ." This IM should state specifically what the County's enforcement program is, and where the public can read about it. It should also specify the consequences that the program provides. Due to the adverse impacts (many of which continue for decades, long after the applicators are gone) of these toxic chemicals to air, water, soil, plants, animals, and the public, the County should put a cap on their use within the County.

I17-465

**ERM-1.14 Mitigation and Conservation Banking Program (p. 8-10):** This Policy is important and long-overdue, but very disappointing because it is so *vague*, rendering it almost meaningless. The only indication of what the “support” will be is that the County will work with others to *identify lands for protection and recovery* of imperiled species impacted by development. **Thousands of acres of those lands have already been identified. The point is to find the means and the money to preserve and protect them** (such as via developer impact fees with which to purchase lands outright or to protect them with permanent conservation easements).

I17-466

**The Policy should be revised to state:** “The County shall *establish and administer* a mitigation program, . . . to evaluate, *identify, preserve and protect* appropriate lands . . . .”

The County was asked to add a concrete and measurable IM with a Timeline for implementation for this Policy.. But it still offers only IM#8 (p. 8-23), which says, “If feasible and needed, the County shall develop and administer a mitigation banking program in conjunction with TCAG and other stakeholders,” timed for 2015-2020, which may be too late for our few remaining riparian and wetland areas, and many of our vernal pools. **How will the County determine whether the mitigation program is “feasible and needed?” What information does it need that it does not already have in order to make this determination?** There are many good working models to follow, in place in other counties. The County’s “ACFP Phase I: Dairy/Bovine Animal Confinement Facilities” states on p. 30 of the “Response to Comments” section, in Response to Comment 20, that “As noted in Section 4.3.3 of the draft PEIR, a Preliminary Draft Habitat Conservation Plan (HCP) was prepared for Tulare County in 1996.” **What happened to this Preliminary Draft Habitat Conservation Plan? Was it ever adopted and implemented? Could it not serve as a basis for the County’s Mitigation and Conservation Banking Program? Why is one of the very poorest counties in California not charging developer impact fees and requiring mitigation for unnecessary loss of its irreplaceable natural resources?**

I17-467

#### **RECOMMENDATION ON MITIGATION AND CONSERVATION PROGRAM:**

A survey conducted by the Association of Environmental Professionals (AEP) found that 82% of the lead agencies responsible for monitoring mitigation efforts had “inadequate in-house staff and funding to perform monitoring and reporting.” “Two thirds of the agencies said that they had not taken enforcement actions against project sponsors for failing to comply with mitigation measures or to perform adequate monitoring and reporting.” Two thirds also said that they had no established procedure for modifying a mitigation measure if it is determined infeasible or inadequate once implementation and monitoring is attempted, and that they “had never modified measures that were determined to be inadequate once monitoring had begun.”

I17-468

**Therefore, please ensure through concrete policies and implementation measures that Tulare County’s program requires developers pay into a fund that is used to maintain staff to monitor mitigation efforts, and that the County does not allow development to proceed until mitigation is complete and demonstrably successful.**

For multi-phase projects, the County should incorporate mitigation checkpoints, so that subsequent development phases cannot move forward until mitigation benchmarks have been achieved. The County's program should require the lead agency and the developer to prepare an annual report on the status of the mitigation measures which must go to the Board of Supervisors for approval, with an opportunity for public review and input.

I17-469

## REQUIRED ADDITIONAL MITIGATING POLICIES AND IMPLEMENTATION MEASURES (RDEIR)

I17-470

Page ES-10 in the RDEIR lists three additional Policies (ERM-1.15, ERM-1.16, and ERM-1.17) and an addition to the text of Policy ERM-1.9 for the Biological Resources section of ERM. No Implementation Measures are indicated. Only Policy ERM-1.9 (see comments above, in GPR order) appears in the GPR, and the GPR does not reference the new Policies. All of these Policies are so vague and weak that they will in no way serve as mitigating policies for the RDEIR, and none has any implementation measure (see detailed comments below).

**ERM-1.15 Minimize Lighting Impacts (RDEIR, p. ES-10)** states that the County shall require lighting in new development to be designed to prevent the lighting from "illuminating adjacent natural areas at a level greater than one foot candle above ambient conditions." **How did the County arrive at this standard for lighting? How and when will the County ensure that new lighting meets this standard?** What will be the consequences if new lighting does not meet this standard? To what degree will this Policy be effective in preserving and protecting sensitive significant habitats, enhancing biodiversity, and promoting healthy ecosystems throughout the County? Are the "ambient conditions" measured before any development takes place? **How will the effectiveness of this Policy be monitored? Do the "adjacent natural areas" include the sky?** The County definitely should require that all exterior lighting in new development also meet "Dark Skies" standards.

I17-471

**ERM-1.16 Cooperate with Wildlife Agencies (RDEIR p. ES10):** This Policy is so vague that it's almost meaningless, and it has no IM. It says that the "County shall cooperate with State and federal wildlife agencies to address linkages between habitat areas." **How and when will the County cooperate with these agencies? How and when will they "address" linkages between habitat areas?** Habitat conversion and habitat fragmentation are key threats to biological resources, so the RDEIR should certainly contain a clear, specific Policy that will promptly and concretely identify and designate critical habitat area linkages and preserve them from disturbance through a strong, clear, timely implementation measure. Not only is this protection key to the sustainability of irreplaceable biological resources, it can make "economic" sense as well, providing open space, recreation areas, wildlife viewing opportunities, green belts and urban separators to maintain the County's rural heritage and increase property values, groundwater recharge areas, natural run-off and stormwater management, etc.

I17-472

101

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

Maintaining these linkages is especially important as plants and animals attempt to adapt to the effects of global climate change.

I17-472  
cont'd

**ERM-1.17 Conservation Plan Coordination (RDEIR, p. ES-10, etc.):** This Policy says that the County “shall coordinate with” other agencies’ conservation planning efforts to protect critical habitat areas that support endangered and special-status species. **How will the County “coordinate” with these agencies? Why doesn’t the County have its own effective conservation plan to protect critical habitat areas (instead of just coordinating with others’ planning efforts)?** Has the County “coordinated” in the past with these agencies? What have the results been? What about implementing critical habitat area protection?

I17-473

## **ERME 8.2 Mineral Resources – Surface Mining (GPR p. 8-11 ff)**

I17-474

**ERM-2 Mineral Resources – Surface Mining (p. 8-11):** The County should take at least equal care to conserve, identify, and restrict incompatible development from its other environmental resources as it does with its aggregate and mineral deposits. **Many of the Policies and Implementation Measures for this section are much too vague to serve mitigation or implementation for the RDEIR, and several of the IMs that were in the 2008 version have been eliminated in the 2010 version. Please explain why these measures (some of which were actually concrete, such as the requirement for annual inspections) have been deleted.**

**ERM-2.2 Recognize Mineral Deposits (p. 8-11):** What does this Policy mean when it says the County will “recognize as a part of the General Plan” areas of identified or potential mineral deposits? What does “recognition” entail? How does it change anything?

I17-475

**Figure 8-2 Tulare County Mineral Resource Zones (p. 8-12)** is now included. Its Legend shows color coding for three Mineral Resource Zones, labeled MRZ-2a, MRZ-2b, and MRZ-3a, with no further information. **What is the purpose of showing these mineral resource zones? Will zoning and land use be affected in these zones? Are these zones already mapped on the County’s Regional Planning Framework, Land Use Designations and Boundaries Map (they don’t seem to appear on Figure 4-1, GRP p. 4-5)? Please explain the intent and purpose of this Policy and how it will affect land use and planning.**

**ERM-2.6 Streamline Process (p. 8-11):** This Policy should be revised to clarify that the streamlining process shall continue to ensure full CEQA review and establishment of applicant’s financial responsibility for ongoing mitigation and reclamation. **How does “a streamlined . . . permitting process” “help encourage long-range planning?”**

I17-476

<p><b>ERM-2.6 Streamline Process and IM #26- (p. 8-26):</b> Please amend this IM to state that the Zoning Administrator shall have no authority to approve any mining permits or reclamation plans without prior public notice and due consideration of public comment.</p>	<p>I17-477</p>
<p><b>ERM-2.7 Minimize Adverse Impacts (p. 8-11) and IM #27 (p. 8-26):</b> This Policy should include global climate change impacts and GHG emissions related to mining, also PM10 and PM2.5 and other particulates. This vague, but very important, Policy needs a strong, clear, enforceable IM;</p> <p>Please revise IM #27 to include an indication of what procedures will be devised to mitigate significant conflicts and change the Timeline to 2010-2015, which is what it was in the 2008 version. Hasn't the Zoning Ordinance update project already been going on for several years?</p>	<p>I17-478</p>
<p><b>ERM-2.9 Compatibility (p. 8-11):</b> How will the County "encourage" mineral development compatible with surrounding land uses? This Policy and its IMs are much too vague to be monitored or enforced.</p>	<p>I17-479</p>
<p><b>IM #27 (p. 8-27)</b> says that County shall "devise procedures" in the Zoning Ordinance update to "mitigate significant conflicts arising from incompatible land uses" in 2015-2010. <b>What would such conflicts be? What kind of mitigation would be required?</b> Since it appears that these recommendations were made in June of 2006, what's happened on this in the last 4 years?</p>	<p>I17-480</p>
<p><b>IM#29 (p. 8-27)</b> says that where springs and seeps "appear to be vital to the continuation of wildlife," they shall be protected, and that protection techniques "may" include avoidance and/or setback requirements. The great majority of our mining areas are in the desert valley, where all springs and seeps are vital to habitat, wildlife, and groundwater recharge. <b>ALL springs and seeps must be protected, and the techniques must be clearly specified, with avoidance required and setbacks of the number of feet necessary (not less than 150') to ensure preservation of the spring or seep. Where will the County specify these requirements?</b></p>	<p>I17-481</p>
<p><b>WHY WAS former IM#31 (p. 8-17 in the 2008 version) eliminated from the 2010 ERM Implementation Measures?</b> It read, "Reclamation plans shall provide for an appropriate and beneficial use of the land, consistent with the Tulare County General Plan, subsequent to the completion of surface mining activities." <b>Please restore this very important IM to the 2010 GPR.</b> The standard of "appropriate and beneficial use" is an important measure of the results to be achieved by reclamation. (This is now partly covered in Policy ERM-2.13 on p. 8-13, but it says "future" [meaning when?] beneficial use and does not say "appropriate" [meaning compatible]. <b>IM#38</b> on p. 8-29 also touches on this requirement, but it is shown as implementing ERM-2.11 and 2.13.)</p>	<p>I17-482</p>
<p><b>ERM -2.11 Conditions of Approval (p. 8-13):</b> Where and when and how will these procedures be established?</p> <p><b>IM#33 (p. 8-28 – 8-29):</b> Please change "should" to "shall" in the second sentence of this IM ("Conditions <i>shall</i> be imposed . . ."). <b>Why has item "c" been deleted from this IM?</b> In the 2008 version (IM#36c, p. 8-18), this item read, "If at any time it is reasonably demonstrated that there is a</p>	<p>I17-483</p>

significant negative impact to an offsite water supply, the mine operator shall be required to cease and desist all mining activity. Mining shall not be permitted to resume until the negative impact in question has been fully mitigated or resolved.” <b>Given Tulare County’s severe problems with water supply and quality, this extremely important IM must be restored to the 2010 GPR, and it should be revised to specify also “water quality” under significant negative impact.</b> Mining operations must be held responsible for mitigating and resolving negative impacts to water supply and quality.	117-483 cont'd
<b>WHY has former IM#37 re Conditions of Approval (p. 8-18 in the 2008 version) been deleted from the 2010 version?</b> This IM stated that the County “shall ensure that the air pollution variance system is actively enforced in order to uphold established rules and regulations. Air pollution inspectors shall have cease and desist powers in order to stop offenders promptly upon discovery.” <b>Given Tulare County’s severe air pollution problems, please restore this important IM to the GPR.</b>	117-484
<b>WHY has former IM #38 re Conditions of Approval (p. 8-18 in the 2008 version) been deleted from the 2010 version?</b> This IM said, “Financial assurances shall be required as a part of the reclamation plan approval process. Said assurances shall be reviewed on an annual basis by the lead agency, and adjusted as necessary, to assure that sufficient funds are maintained to carry out the reclamation plan.” <b>Given that Tulare County is one of the poorest counties in California, and given the reclamation track record of the mining industry, please restore this critical IM to the 2010 GPR.</b> (Mine reclamation costs are mentioned in ERM-2.13, p. 8-13, but it has no financial assurance implementation measure and does not require the important annual review and adjustment.)	117-485
<b>WHY has former IM#39 re Conditions of Approval (p. 8-18 in the 2008 version) been deleted in the 2010 version?</b> This IM required all surface mines, unless otherwise exempted, to obtain a surface mining permit and an approved reclamation plan in accordance with SMARA. <b>Please restore this IM to the 2010 GPR to protect our County’s environmental resources and finances.</b> (This is partly covered in Policy ERM-2.13 on p. 8-13, but it doesn’t mention the permit or an “approved” reclamation plan.) <b>Please explain what would exempt mines from obtaining permits and an approved reclamation plan.</b>	117-486
<b>ERM-2.12 Approved Limits (p. 8-13): Please change “will” to “shall” in this Policy. When, where, and how will these procedures be established?</b> Based on the adage that “You don’t get what you expect, you get what you inspect,” this is a very important Policy.	117-487
<b>IM#34 (p. 8-29): Please explain and clarify the meaning and intent of this extremely vague IM. Under what circumstances “may” the County enter into MOUs or develop “other protocols” for coordinating and simplifying the administration and processing of SMARA and CEQA documents? What kind of “simplifying” is intended? Are these MOUs and “protocols” subject to public notice and public review? How does this IM “ensure that vested interest mining operations remain with their approved area and/or production limits,” as the Policy states?</b>	117-488

ERM-2.13 SMARA Requirements (p. 8-13): Why would the County exempt (“unless otherwise exempted, shall be subject to”) a mine from reclamation meeting SMARA requirements? <b>Please revise to:</b> “All surface mines shall be subject to completion of reclamation plans that meet or exceed SMARA requirements or better.” <b>Reclamation should be carried out to the degree possible during the time that surface mining is occurring,</b> not delayed until the mining activities are completed, which is when too many mining operations dissolve or declare bankruptcy and fail to carry out reclamation.	I17-489
IM#38 (p. 8-29): Thank you for addressing phased reclamation. <b>Please change “will” and “should” to “shall” to make this measure enforceable.</b> Who approves the reclamation plan?	I17-490
<b>WHY</b> has the former IM#44 (p. 8-19 of the 2008 version) been deleted for this Policy? It required the owner/operator to <i>obtain all necessary permits and comply with all local, State, and federal agency codes, policies, and regulations.</i> <b>Please restore it, or explain how it is required elsewhere.</b>	I17-491
<b>Why</b> has the former IM#45 (p. 8-19 of the 2008 version) been deleted for ERM 2.13? This IM stated that the County “shall conduct an <i>annual inspection</i> of all extraction sites. (1) All general conditions and special conditions of approval of the surface mining permit and approved reclamation plan must be complied with at all times in order to continue the uses allowed.” Given the extensive permanent environmental damage produced by mining operations and the necessity of ongoing reclamation work, it is essential that the County inspect extraction sites annually at a minimum, and preferably more often. <b>Please restore this IM or explain how these inspections are required elsewhere in the GPU.</b>	I17-492
GPR 8.3 Mineral Resources – Other (p. 8-13 ff)	I17-493
ERM-3.1 Environmental Contamination (p. 8-13): <b>This vague Policy must be clarified: what “precautions” must be taken to avoid contamination?</b> Please include IMs for these “Other” extractive activities, including all oil and gas extraction operations, to require phased reclamation plans to restore to compatible beneficial use and financial guarantees similar to those listed above for surface mining.	
ERM-3.2 Limited Mining in Urban Areas (p. 8-13): <b>“Should” is not a Policy statement; please change to “shall.”</b>	I17-494
ERM-3.3 Small-Scale Oil and Gas Extraction (p. 8-13): <b>This Policy should require the County to evaluate the GHG emissions and global warming impacts of such activities prior to permitting them; such activities could negatively affect the County’s ability to comply with AB32 and the County’s Climate Action Plan.</b>	I17-495

Additionally, given its impending crisis in water quantity and quality, this Policy should also require the County to carefully evaluate the impact of proposed extractive activities on water quality and supply prior to permitting extraction activities. | I17-495 cont'd

The GPU documents and the County's Climate Action Plan must include discussion and evaluation of the environmental impacts and risks associated with oil and gas extraction, including those related to disposition of solid wastes from drilling and workover operations; contaminants in produced water and in cuttings; leaching of contaminants from reserve pits; emissions of VOCs and methane from leaks and venting of overpressure and conditioning of natural gas; flaring of gases such as methane, hydrogen sulfide, and nitrous oxides from combustion; release of contaminating fluids from spills, leaks, blowouts, and deliberate releases for re-injection, discharge of separated water to percolation pits, and reuse of separated water (as for irrigation and road dust suppression); subsurface migration of contaminants between aquifers due to casing leaks; idle and orphan wells; etc. Natural gas and oil production emits significant methane (one ton of which has the global warming potential of 21 tons of carbon dioxide); methane is also emitted during processing, transmission and storage, and distribution. There is also GHG impact from fuels burned to support field production. **Where are these impacts addressed in the RDEIR, the Background Report, the GPR, and the Climate Action Plan?** | I17-496

ERM-3.4 Oil and Gas Extraction (p. 8-13): Same comment as on ERM-3.3, directly above. | I17-497

ERM-3.5 Reclamation of Oil and Gas Sites (p. 8-7): Please amend this Policy to include a timeframe in which reclamation must be completed, and clarify "timely"; e.g. , "Reclamation shall be completed timely to the satisfaction of the County within a period not to exceed one year from the termination of extraction activities." **Correct the second sentence:** "Reclamation costs shall be borne by . . . ." | I17-498

ERM 8.4 Energy Resources (GPR p. 8-14): This section should deal with *Energy and Water Resources*. There are no Implementaton Measures for any of the Policies in this section, and the Policies are so vague ("encourage," "promote," "participate," "coordinate," "support") that they provide no assurance of achieving anything; they cannot serve as mitigation or implementation for the impacts listed in the RDEIR. | I17-499

The RDEIR lists on p. ES-8 (in Table ES-3, Required Additional Mitigating Policies and Implementation Measures), etc. two new Policies, ERM-4.7 and ERM 4-8, which are not mentioned in the GPR. They are equally vague and unreliable, as discussed below. | I17-500

ERM-4.1 Energy Conservation and Efficiency Measures (p. 8-14): This Policy should be changed to deal with "Energy and Water Conservation and Efficiency Measures." Global warming, the requirement to comply with | I17-501

AB32, our impending water crisis, and common sense dictate that the County must not simply “encourage” energy and water conservation and efficiency.

I17-501  
cont'd

Please amend to: “The County shall *require* the use of best available energy and water conservation and efficiency technologies, including, but not limited to, solar energy . . .panels, *on-demand tankless water heaters, compact fluorescent light bulbs or better , energy- and water-saving appliances (high Energy Star ratings or better), and water-saving landscaping plant materials, mulches, and irrigation methods and controllers .”*

Please expand and strengthen this Policy, and give it a concrete, measurable Implementation Measure. The State Attorney General’s Office website (along with many other websites) lists numerous measures to promote energy efficiency and renewable energy and water conservation and efficiency.

Many more such measures should be provided for in this section. If water conservation and efficiency measures are not going to be discussed in this section, there should be a box showing where this essential information is provided.

I17-502

The County should establish a baseline of current water and energy use per capita and establish specific, measurable goals for reducing per capita usage significantly year by year.

ERM-4.2 Streetscape and Parking Area Improvements for Energy Conservation (p. 8-14): Please amend this to: “Streetscape . . . *Energy and Water Conservation.*” This is an important Policy because of global warming, the requirements of AB32 and the County’s Climate Action Plan, and the desirable goal of beautifying our urban areas; the trees will cool and clean the air and cool the surfaces below them and will beautify street and parking areas and encourage pedestrian traffic, which could help to reduce VMTs.

I17-503

This Policy should require that developers plant the trees and ensure that funds will be available for their maintenance. The County should require that the trees be large-canopy native trees whenever possible, so as to provide habitat and drought tolerance. If the trees are not natives, they must still be drought-tolerant. The trees should be mulched and should be watered with recycled water. This Policy needs a concrete, enforceable, measurable Implementation Measure which will be effective before 2011. It should be done this year. It takes a long time to grow a tree large enough to mitigate global warming.

ERM-4.4 Promote Energy Conservation Awareness (p. 8-14): This should be changed to “Promote Energy and Water Conservation Awareness.” This Policy is worded so vaguely as to be almost meaningless and it has no Implementation Measure. Of course, the County should provide public education on this critical subject. Will it? How and when? Please strengthen and clarify the Policy and provide a concrete, measurable IM.

I17-504

ERM-4.5 Advance Planning (p. 8-17): Please amend this Policy: “The County shall participate . . . in identifying and implementing long-range strategies and facilities, with an emphasis on reducing energy and water consumption in order to reduce GHGs and global climate change impacts.” ERM-4.6 Renewable Energy (p. 8-17): This Policy must be clarified and strengthened. How will the County “support” efforts for development and use of

I17-505

107

alternative energy resources? What is meant by “appropriately sited?” **This Policy needs an Implementation Measure** that shows how and when the County will effectuate renewable energy measures. For example, the County should require all new dairies to install methane capture systems to generate energy. The County should require solar energy systems on all new construction. Etc. Also, it is very important that bio-fuels not require more energy to produce than what they provide.

I17-505  
cont'd

**ERM-4.7 Reduce Energy Use in County Facilities (RDEIR p. ES-8, etc.):** This Policy says, in its entirety, “Continue to integrate energy efficiency and conservation into all County functions.” How is this being done? How long has it been going on? What results have been achieved? What additional measures will be implemented, and on what timeline? **Please make this almost meaningless Policy clear and strong and provide it with concrete, enforceable, measurable Implementation Measures.** The County definitely should be setting the example and leading the way in energy efficiency and conservation (and strong, effective programs would save the taxpayers money as well, along with reducing GHG emissions, complying with AB32 and the County’s Climate Action Plan, etc.).

I17-506

**ERM-4.8 Energy Efficiency Standards (p. ES-8, etc.):** This Policy says that the County “shall encourage renovations and new development to incorporate energy efficiency and conservation measures that exceed State Title 24 standards. When feasible, the County shall offer incentives for use of energy reduction measures such as expedited permit processing, reduced fees, and technical assistance.” **What determines “when feasible?” By how much will builders and developers have to exceed Title 24 standards in order to qualify for the incentives? How will these incentives be publicized? Which fees will be reduced? What kind of technical assistance will the County provide?** Requiring greater energy efficiency to be incorporated in renovations and new development, and incentivizing it, could help the County to reduce GHG emissions and comply with AB32 and its Climate Action Plan. **Please provide a clearer, stronger Policy, and concrete, measurable Implementation Measures for ERM-4.8.**

I17-507

**ERM Section 8.5 Recreation and Open Space Resources (GPR p. 8-14 ff)**

**Almost all of this section’s Policies and Implementation Measures are too vague and weak** (“where feasible,” “shall consider,” “shall encourage,” “should encourage,” “shall work with,” “shall promote,” “shall support,” “shall make efforts,” “will determine the best means,” “shall cooperate,” “should initiate,” “should consider”) **to serve as mitigating policies and implementation measures for the impacts described in the RDEIR. Please clarify and strengthen the Policies and provide them with concrete, measurable implementation measures. Most of the IMs for this section are shown as “ongoing.” Where are the results? How can their effectiveness be demonstrated?**

I17-508

**ERM-5.1 Parks as Community Focal Points (p. 8-14) and IMs # 40 and #41 (p. 8-30):** Providing community center/recreation buildings to new and existing parks sounds like a fine Policy, but this is only “where feasible,”

I17-509

which is not defined, and the IMs indicate that the County, on an ongoing basis, is passing the responsibility for carrying it out to local entities such as CSDs and developers. Prospects seem dim for our County parks: the Background Report (p. 4-3) indicates that the County is currently “not proposing any new parks due to budget restrictions for operation of the facilities.” There is no way to measure the success of this Policy or its IMs. The County should set specific goals for providing community center/recreation buildings to specific parks, with a timeline for targeting their completion. The Background Report provides no baseline information on existing community center/recreation buildings. It may be noted that, per Table 4-1 (pp. 4-4) in the Background Report, only 4 of the County’s 21 unincorporated communities (and none of the 11 hamlets) even have County parks, (although Bartlett Park is located 8 miles east of Porterville, and Allensworth State Park is about 7 miles from Earlimart, both too far for most visitors to access without driving; perhaps the residents of the hamlet of Allensworth visit the State Park. Allensworth, however, is a historical park, not a community focal point or recreational area).

117-509  
cont'd

**IM#40 (p. 8-30)** says the County will “encourage and assist” (how will the County do this?) local entities to assume parkland acquisition, development, operations, and maintenance. **Have any local entities done so? Does this apply to County parks? How does this promote the Goal of recreation related to Environmental Resources Management?**

117-510

**IM#41 (p. 8-30)** says “When appropriate” (please define or clarify), “based on the size of the development” (please define or clarify), “or if new facilities are installed as part of an approved residential project,” the County “shall require the creation of a service district or landscaping and lighting district to maintain the park and its facilities.” This is characterized as a new program that is ongoing. **Have these districts been created? Are these public parks? Where are they? How do these districts help to achieve the Goal of recreation related to Environmental Resources Management?**

117-511

**ERM 5.2 Park Amenities (p. 8-15):** This is yet another fine-sounding Policy with no concrete plan indicated, and no way to measure the County’s success in providing these amenities. The only IMs are #40 and #41, discussed directly above. There appears to be no baseline information in the Background Report on these amenities, other than in Table 4-1 (pp. 4-4), which indicates that many of the County parks have reservable picnic areas and one has campsites. **Table 2 shows only one park, Mooney Grove, out of the total of 13 County parks, with additional amenities such as paddle boats, a playground, and baseball diamonds.** And, as noted directly above, in the ERM-5.1 comment, the great majority of the County’s unincorporated communities and hamlets have no County parks. **So how and when will the County provide a broad range of recreational opportunities within community parks?**

117-512

**ERM 5-3 Park Dedication Requirements (p. 8-15):** This is a much-needed Policy. **How and when shall the County “require the dedication of land and/or payment of fees to ensure funds for the acquisition and development of parkland” and other properties as development occurs?**

117-513

IM#40 and #41 (discussed above) are cited for this Policy, along with IM#42 (p. 8-30), which says that the Board of Supervisors “shall establish and adjust, as appropriate, a park development impact fee based on a level of service to provide for funding that meets the actual cost, park acquisition, and development.” This is shown as a New program with an ongoing timeline. **When will this park development impact fee be charged? To whom will it be charged? What is meant by “based on a level of service?” Why doesn’t this provide for ongoing maintenance as well? Please make this a more clear and concrete IM and clarify whether it is already in effect and creating new parks..** (The Quimby Act was enacted in 1975.) Parks are very important to public health, to tourism, to helping to mitigate heat island effects, to beautification, to runoff and stormwater management and groundwater recharge (if so designed); and, if well planted with native large-canopy trees, they can provide habitat and air cleaning and assist in achieving compliance with AB32 and the County’s Climate Action Plan.

I17-514

**ERM-5.4 Park-Related Organizations (p. 8-15):** This Policy is too vague (“consider”) and has no IM other than #40 and #41, discussed above. **What are the “existing entities” referred to in this Policy? Once the County has “considered” these various possibilities for generating funds, what will it do to actually acquire and develop and maintain parklands and historical properties?** The County should ensure that no new development is permitted in the County without the creation of new parklands or the preservation of open space, achieved either by direct applicant development and maintenance of the park or by applicant’s payment of impact or mitigation fees to be used for the creation of a nearby accessible park or preserved open space area. The County should have a master plan included in its land use map and zoning for park and recreation and open space lands. These amenities enhance property values and quality of life and should be funded by those who benefit from them.

I17-515

**ERM-5.5 Collocated Facilities (p. 8-15):** It’s wonderful to locate parks near public facilities and other attractions. **How will the County “encourage” this? Has the County no way to make this attractive vision a reality?**

I17-516

**ERM-5.6 Location and Size Criteria for Parks (pp. 8-15 and 8-16) and IMs #40, #41, #42, and #43:** The Background Report seems to provide no baseline information on neighborhood Play Lots (Pocket Parks) or Neighborhood Parks. Thus, progress on the goals and policies and implementation measures for Recreation and Open Space Resources can’t be readily measured. The Report indicates that the County lacks Community Parks (only 4 of the 21 unincorporated communities and none of the hamlets appear to have County parks).

I17-517

Although the County’s population is now well over 400,000, we have no Regional Parks over 200 acres in size and only one large somewhat centrally located County park (Mooney Grove, 143 acres). The largest County-owned park, beautiful Balch Park, is too far away in the mountains for most residents to visit it with any regularity at all. **The County desperately needs more large parks in the valley, where its population is, and where many people would not have to drive much, or preferably at all, to visit them.** The first guideline listed on p. 8-16 is that the County “shall strive to maintain an overall standard of *five or more acres of County-owned*

I17-518

110

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

improved parkland per 1,000 population in the unincorporated portions of the County. In the 2008 version (p. 8-9) this was an overall standard of “*five to nine acres.*” Why has the County changed this guideline? Given its rapidly increasing population and the huge costs of medical care for the long-term medical conditions plaguing its increasingly obese population, the County should ensure that County-owned improved parkland is increasing proportionately (and the land isn’t going to get cheaper, so it should be planned for and designated and funded now). The many other Environmental Resources Management values of such land should be factored in to its cost/benefit calculations.

I17-518  
cont'd

The County’s unincorporated population is currently probably well over 150,000, and growing every day. Table 4-1 in the Background Report (p. 4-4) shows a total of less than 700 acres of County-owned parkland, already less than the minimum of 5 acres per thousand, and with no new parks proposed, per BR p. 4-3. For the health and welfare of its residents, and to mitigate global warming and GHG emission impacts, and to work toward compliance with AB32 and its Climate Action Plan, the County must implement effective, measurable programs to ensure a timely and significant increase in the number, type, size, and accessibility of County parks. Page 8-15 of the GPR states that “Neighborhood play lots (pocket parks) are *encouraged* as part of new subdivisions applications.” The County should require all developments to provide or contribute to the provision and maintenance of parks (see above comment on ERM-5.7).

I17-519

IM #42 Park Development Impact Fee (p. 8-30) states that the Board of Supervisors shall establish such a fee “as appropriate,” but has it actually done so? If so, when and where, and what are the results?

I17-520

IM #52 Access to Suitable Recreation Land (p. 8-30): states that maximum efforts should be concentrated on acquiring recreation sites within one hour’s travel time from urban concentrations throughout the County. Please revise to “. . . sites *within walking or cycling distance whenever possible, and within 10 to 15 minutes’* travel time from urban . . .” The County needs recreation land and open space in or adjacent to its urban concentrations to promote healthful activity for its residents, and for environmental benefits. Locating recreational lands distant from populations will discourage their use, especially as gas prices increase, and will add unnecessary VMTs for getting to recreation and open space lands; this will not help us achieve compliance with AB32 and the County’s Climate Action Plan. Also, urbanized areas need open space lands nearby for groundwater recharge, habitat, and runoff and stormwater management and flood control. What are the “maximum efforts” that “should be concentrated upon acquisition of these sites? Please clarify what is meant by “sites that can be developed for intensive use?”

I17-521

Background Report Figure 4-1 Existing Parks (p. 4-5): Thank you for correcting the many errors that were on this map in the 2008 version.

I17-522

**ERM-5.7 Public Water Access (p. 8-16) and IM #40 and #41 (p. 8-30):** Since the overwhelming majority of the County's residents live in and spend the overwhelming majority of their time in the desert environment of the valley, public access (well regulated so as not to abuse the resource and habitat) to water courses would be very desirable, as would acquisition of multi-purpose sites. **Which watercourses are being referred to here? This Policy must be strengthened beyond its vague "encourage" and armed with a concrete Implementation Measure showing how and when the County will acquire these access sites and rights (IM#40 and #41 do not seem to be very directly related to this Policy, and are too vague themselves).** Lakes Success and Kaweah, of course, are operated by the U.S. Army Corps of Engineers and already provide lake access, swimming, fishing, boating, hiking, and camping opportunities.

I17-523

**ERM-5.8 Watercourse Development (p. 8-16):** In the 2008 version (p. 8-10), the County required a buffer of "at least 150 feet from the high-water line edge/bank." **WHY has the County reduced this buffer minimum to "at least 100 feet" in the current version?** Please restore this Policy to *at least* the 150 foot minimum, or, better yet, increase it to three hundred feet. **Major watercourses and their riparian areas are about the rarest and most endangered environmental resources in Tulare County, so the County should protect them as much as it possibly can. Please revise this Policy to indicate that a qualified resources conservation professional shall determine the necessary buffer parameters beyond the required minimum on a case by case basis, depending on the location, habitat, soils, etc. at the specific site. Avoidance is essential here; this environmental resource is now almost gone in Tulare County; there is no way to "mitigate" for the loss of any more of it. What "industrial uses" are being referred to here?**

I17-524

**IM#44 Shoreline Development Standards (p. 8-30):** Please revise: "The County shall develop . . . such as . . . public access, and *requiring* protection of scenic and recreational assets. . . ." **Why does the County not currently have development standards regulating well drilling, location of septic tanks, building setbacks, lot sizes, and public access in conformance with Government Code Section 66478a? Septic tanks on shorelines and along water courses and waterways must be regulated right away, not in 2015, for public health and safety and environmental health and safety.**

I17-525

**ERM-5.9 Encourage Development of Private Recreation Facilities (p. 8-16):** Why should the County encourage private interests to establish new commercial recreation opportunities in the County? Since almost 30% of the County's population lives in poverty, why shouldn't the County encourage public recreation opportunities so that low income would not be a barrier? Please revise the second sentence: "The intensity . . . shall not exceed . . . and shall be compatible . . . ."

I17-526

**IM#40 and #41 don't really seem to apply to this Policy, but no others are listed. How would the County "encourage" private interests to establish commercial recreation opportunities?**

I17-527

**ERM-5.10 Recreational Facilities for Special Use Groups (p. 8-17):** Please revise to: “The County *shall ensure* the provision . . .” “Should” is not an adequate Policy statement. **IM #45 and IM #46 (p. 8-31)** are shown for ERM-5.10; neither relates directly to it, but both are important.

I17-527  
cont'd

**IM#45** requires developers who propose to build public recreation facilities to post bonds or cash deposits to ensure completion [and it should say “and”] to ensure long-term maintenance. This is shown as “ongoing.” Is it required by Ordinance, or what? Have any developers built public recreation facilities and posted the bonds or deposits? If so, where are they? Are they being well-maintained? How effective has this implementation measure proven to be?

I17-528

Please revise **IM #46** by changing each “should” to “*shall*” because “should” is not enforceable. Furthermore, “should initiate the development of a park master plan” does not implement anything. **This IM should be made clear and concrete:** “The County *shall develop* a park master plan.” This is especially important when the County plans to direct growth into the unincorporated communities and hamlets, since almost none of them have park facilities or nearby regional parks. The County should work with experienced organizations such as The Trust for Public Land to help determine the needs of residents and visitors, and these stakeholders should be involved throughout the process. Since over a quarter of the County’s population is low-income or below (and a high percentage of these residents reside in the unincorporated County), and these residents cannot well afford to travel to recreational sites, it is indeed important to focus on providing for parks and open space in their communities, especially when these facilities could serve Environmental Resource Management priorities as well. Involvement of citizen and community stakeholders, and other concerned stakeholders, should be mandatory throughout the development of the park master plan. The County should designate land use for future parks and open space on its land use maps now. **Figure 8-1 (GPR p. 8-7)** currently seems to designate only agricultural lands and flood plains (other than the Federal lands) as open space, but aren’t the agricultural lands and floodplains almost entirely privately owned and not open to public recreation? Are these lands being managed to preserve and protect sensitive habitats and cultural and archaeological sites, enhance biodiversity, promote healthy ecosystems, and serve the recreational needs of County residents and visitors?

I17-529

I17-530

**ERM-5.12 Meet Changing Recreational Needs (p. 8-17):** While the recreational opportunities are excellent in the national and state forests and parks, they are generally remote from the County’s main population centers, which are all in the valley. Many residents cannot afford the time or gas required to visit these parks with any regularity at all, plus that’s a lot of VMTs. When I worked at Social Security in Visalia, I met many valley residents who had never visited the Federal lands in the County, and some who did not even know that we have National Parks and national forests in our back yard. A good way to promote visitation would be to implement more public transportation, such as the Park Shuttle from Visalia, which would also reduce VMTs and help with AB32 compliance and compliance with the County’s Climate Action Plan. Please clarify this Policy (how will the

I17-531

113

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

County “promote?”) and provide it with a concrete, measurable Implementation Measure. What is meant by “Changing Recreational Needs?” How are they changing? | I17-531  
cont'd

**ERM-5.13 Funding for Recreational Areas and Facilities (p. 8-17):** Please clarify this Policy (how will the County “support” and “strive?”) and provide it with a concrete Implementation Measure. | I17-532

**IM #40 (p. 8-30)** states that the County shall encourage and assist CSDs or other local entities to take over all functions related to parkland in established areas. Does this mean that the County’s goal is to push this responsibility onto much smaller and less well funded local entities? “Support” means give it to someone else to do? What is the likely effect of this on the viability of our parklands and recreational areas? | I17-533

**IM#41 (p. 8-30)** talks about creating special districts to maintain parks and facilities. | I17-534

**IM#45 (p.- 8-31)** says the County will require developers who propose to build parks to post financial assurances of completion and maintenance. The Background Report and the RDEIR should be revised to discuss in much more detail the County’s current parks and open space and Environmental Resource lands, and the County’s current programs and also plans for creating and maintaining and funding publicly-accessible land for recreation. The current information is deficient and inadequate, as it does not properly inform the reader of existing conditions, proposed conditions, and the efficacy of current and proposed funding measures. | I17-535

**ERM-5.14 Park Design (p. 8-17):** Please clarify this Policy (what kind of efforts?). | I17-536

The IM specified for it in the 2008 GPR (**IM #56, p. 8-20 in 2008**) was not closely related to ERM-5.14. This IM is now IM#47 (p. 8-31) and is no longer indicated as implementing ERM-5.14 (it now says it implements ERM-5.15). So, how will the County “make efforts” to involve community members in park design and development? Is it doing so now?

**ERM 5.15 Open Space Preservation (p. 8-17) and IM #48 (p. 8-32):** Preservation of open space is a high priority of Tulare County residents, important to the tourism industry, extremely important for recharging our hugely over-drafted groundwater basins, and also very important to global climate change and compliance with AB32 and the County’s Climate Action Plan. The only Implementation Measures for Policy ERM 5.15 (other than the tangentially related IM#40 and #41 on p. 8-30) are #47 (p. 8-31), which was formerly listed as implementing ERM-5.14, and #48(p. 8-32). | I17-537

**IM#47 (p. 8-31)** seems to state that the County has an ongoing program through subdivision and development approvals of acquiring scenic and open space easements, including wooded areas, flood plains, scenic and historic sites, and other recreation areas. Please clarify this IM. Is this a mitigation program? Where can it be found? Where are the easements that have been acquired? Are they open to the public? Who manages these easements? How many acres of land have been put into such | I17-538

easements? The Background Report and the RDEIR should provide a detailed discussion of this program and its effectiveness so that the reader can evaluate it as a mitigating and implementing measure.

I17-538  
cont'd

IM#48 (p. 8-32) was IM#57 in the 2008 GPR. The 2008 version stated that "The County's existing open space land protection program, which is centered on implementation of the Williamson Act, shall be continued . . . "

I17-539

The current version no longer states that the County's program is centered on the Williamson Act program. Lands under the Williamson Act, which is a State voluntary program for private landholders, typically are not accessible to the general public because they are used almost entirely for private agricultural purposes(although some are contracted to preserve open space). The State of California has been regularly threatening over the past several years to stop its subvention program for Williamson Act contracts. The current IM says that the County "should consider" other tools, such as Transfer of Development Rights, as needed. Such programs are clearly needed now. What is the County's plan to preserve open space without the Williamson Act? **"Should consider" is NOT an implementation measure. Please make this concrete and clear, with a definite timeline.** Many counties have implemented TDR programs. They also have development mitigation programs that require preservation of open space lands and Oak Woodland Management Plans that provide for voluntary conservation measures on private lands.

As discussed several times above, the County must establish development impact mitigation programs and an Oak Woodlands Management Plan as soon as possible, and should be using all the tools available to it to meet the priority goal of preserving and protecting meaningful portions of its open space for the public and for Environmental Resource benefits. Global climate change makes this especially urgent.

I17-540

**ERM 5-18 Night Sky Protection (p. 8-17):** As previously stated, given the need to save energy and reduce GHG emissions, the benefits of preserving visual access to the wonder of our night sky, the advantages of preventing light trespass, the benefits to wildlife and to human health, and the fact that local astronomers and many residents support it, the County should promptly adopt and implement International Dark-Sky Association "Dark Skies" lighting design and fixtures standards (readily available on the web) for all new and renovated exterior lighting. The best means to protect visibility of the night sky (and to provide the other important benefits) is to promptly adopt an ordinance requiring that these standards be met. This Policy should be made clear and strong, with a definite course of action. It should be provided with a timely, concrete Implementation Measure so that these Environmental Resources (and human health and our rural character) will be protected. (The only IM presently referenced is #40, which has almost nothing to do with this Policy.)

I17-541

**ERM-5.19 Interagency Cooperation (p. 8-10):** This duplicates Policy ED-5.14. Per Matrix p. 193, #2, this Policy was to be moved to Economic Development. It's been moved, but has not been deleted here. **What is meant by "develop and promote the establishment of Three Rivers and Springville as gateway communities?"** Aren't these communities established as gateways already by their geography? **How will they be developed and promoted? How will the County "cooperate" in this effort? What is its intent, and how does it serve the Goal of providing parks, recreation, and open space to serve the needs of County residents and visitors, with emphasis on recreation related to Environmental Resources Management (p. 8-14, ERM-5)?** This Policy is so vague as to be meaningless. **Please clarify it and provide it with a useful IM.**

I17-542

## 8.6 Cultural Resources (GPR p. 8-18 ff)

I17-543

**ERM-6.2 Protection of Resources (GPR p. 8-11 and RDEIR p. ES-10, etc.):** Thank you for revising this Policy in the RDEIR (as a Required Additional Mitigating Policy) from "should encourage . . . protection" to "shall protect," and adding "as determined by a qualified archaeological professional." This change should be referenced in the GPR. IM #49 (p. 8-32) should help, once the provisions are incorporated. Haven't these measures been required for years by State and Federal regulations?

**ERM-6.3 Alteration of Sites with Identified Cultural Resources (GPR p. 8-18 and RDEIR p. ES-10, etc.):** The RDEIR lists this Policy as a "Required Additional Mitigating Policy," but it is exactly the same as the Policy statement is the 2008 and 2010 GPR except that in the second sentence one word has been changed: "Development *should* be permitted" has been changed to "Development *can* be permitted." "Should" is not a Policy statement. **In the first sentence, please change "should" to "shall."** In the second sentence, please change "should" or "can" to "shall." The RDEIR version will not suffice as a mitigating or implementing policy or measure. IM#49 should have been incorporated years ago into the County's development regulations, in order to comply with State and Federal law.

I17-544

**ERM-6.5 Cultural Resources Education Programs (p. 8-19):** This Policy of "should support" programs, with no IM, is too vague and unsupported to be measurable or enforceable; **it should be strengthened and clarified and given a concrete Implementation Measure.** How *shall* the County support these programs? No IM is listed for this Policy to give it any effect.

I17-545

**ERM-6-6 Historic Structures and Sites (GPR p. 8-19 and RDEIR p. ES-11, etc. ) and IM #50 (p. 8-32):** Although not so noted in the GPR, this Policy has been revised in the RDEIR as a Required Additional Mitigating Policy and Implementation Measure. At the end of the first sentence of the Policy in the RDEIR, "sites and parks" have been added after "historical structures." This is a good addition. A second sentence has been added in the RDEIR: "Where applicable, preservation efforts shall conform to the current Secretary of the Interior's

I17-546

Standards . . .” However, this Policy still is far too vague, as it gives no idea of how the County “shall support” these preservation efforts.	I17-546 cont'd
The “shall support” of the Policy has an <b>IM (#50, GPR p. 8-32))</b> stating that <b>the County “should” establish a committee</b> , with a Timeframe that has been changed from” Ongoing” in the 2008 version to 2010-2015 in the current version. Is this to imply that the County should have established this committee for quite some time, but it hasn’t yet, but it “should” do so in the next 5 years? Please change “should” to “shall.” “Should” is NOT implementing language. The last bullet of this IM indicates that the committee would “determine appropriate locations . . . as a Certified Local Government.”	I17-547
The <b>Background Report (BR p. 9-45)</b> states that <b>the County is NOT a Certified Local Government</b> , at least as of September, 2004. Does the County intend to apply for certification as a CLG? <b>Please make this an enforceable, effective, and convincing IM.</b> The way it is presently written, it will not effect any mitigation or implementation for impacts identified in the RDEIR.	I17-548
<b>The RDEIR (p. ES-11, etc.) goes on to list as Required Additional Mitigating Policies and Implementation Measures three apparently new Implementation Measures, 55A, 55B, and 55C</b> , which it does not directly connect to any particular Policies. These IMs are not mentioned in the GPR.	I17-549
<b>ERM IM #55A Archaeological Resource Surveys (RDEIR p. ES-11, etc.)</b> states that the County shall determine the need for a project applicant to have a qualified archaeologist to conduct specified activities prior to project approval involving ground disturbance or demolition of a potentially historic building. <b>Please clarify how the County shall determine the need and what will happen if the ground or building is determined to be historic.</b>	I17-550
<b>ERM IM #55B Discovery of Archaeological Resources (RDEIR p. ES-11, etc.): Is #55B intended to modify or replace IM#49 (GPR p. 8-32)</b> , which says that the “County shall incorporate provisions into development regulations that in the event archaeological resources are discovered . . .?” In #55B, <b>please change “will” to “shall” in the second sentence.</b> In the third sentence in #55B it appears that project design approved prior to archaeological discoveries takes precedence over the discoveries, and that the archaeologist or paleontologist’s recommendations will not be considered “feasible” if they conflict with the previously approved project design. What factors will be weighed in determining what is “feasible?” <b>Please revise this IM to give greater weight to the importance of unique or significant archaeological and paleontological resources. Dealt with respectfully and sensitively, they could actually significantly increase property values and residents’ identification with and interest and pride in their heritage.</b>	I17-551
<b>ERM IM#55C Discovery of Human Remains (RDEIR p. ES-11, etc.):</b> This measure has been required by State law for many years, so the County should already have been requiring these steps during any construction project. <b>Please change “should” in the second sentence to “shall”: “. . . the following steps shall be taken,” so that the implementation is mandatory, not discretionary; otherwise, this will not suffice as an Implementation Measure for the RDEIR..</b>	I17-552

**ERM-6.7 Cooperation of Property Owners (p. 8-19):** This Policy should be clarified and strengthened and should include a concrete, measurable IM. **“Should encourage” is not a Policy statement. There is no IM.**

I17-553

## 8.7 Soil Resources (GPR p. 8-19 ff)

I17-554

**ERM-7 Soil Resources (p. 8-19):** Please revise to: “To preserve . . . for . . . timber *and habitat* productivity and to protect . . .”

**ERM-7.1 Soil Conservation (p. 8-19) and IM #52 (p. 8-33):** The title of this Policy should be changed to “Soil Conservation, *Protection, and Sustainability*.” **The Policy should be expanded and clarified to cover not just the traditional idea of soil conservation (e.g., implement best practices to keep it from blowing away or being washed away), but also to protect it from the introduction of harmful chemicals (e.g., herbicides and pesticides, nitrates and ammonia, etc.), compaction, salinization from improper irrigation, degradation and desertification from overgrazing, etc.** Urbanization, industrialization, mining, and transportation systems impact soils far more permanently than agriculture. Healthy land, air, and water are the irreducible requirements for human sustenance and quality of life.

I17-555

**Please strengthen and expand IM #52 (p. 8-33) to include these concerns and to ensure that the County’s standards will be sufficiently comprehensive and enforceable to ensure conservation, protection, and sustainability. IM#52 (“County shall adopt standards”) was to have been implemented in 2007-2010 (in the 2008 GPR, p. 8-21). Now the timeline is 2010-2015. These important standards are long overdue. How can these Timelines be relied on for mitigation and implementation for the impacts identified in the RDEIR? (Note that “alternations” in this IM should be “alterations.”) Another key implementation measure for this Policy should be to strictly limit greenfield development in the County, confining all new development to within existing UDBs and the new HDBs. To preserve our soils, we need to implement and enforce highly efficient and responsible land use practices. The County should also minimize the construction of new roads, focusing on compact development and public transit; new roads create a tremendous amount of soil compaction and feed many contaminants into the soil from vehicular traffic.**

I17-556

**ERM-7.2 Soil Productivity (p. 8-19):** Please see and incorporate for this section also the comments on ERM-7.1 and IM #52 directly above. The comments apply to both conservation and productivity of soil.

I17-557

**ERM-7.3 Protection of Soils on Slopes (p. 8-19):** **This Policy should be revised (or another Policy should be added) to protect soils on slopes by also limiting the percentage of the area of the slope that can be graded in order to**

I17-558

118

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

prohibit, for example, switchbacking roads or driveways that remove or degrade from its natural condition and/or function more than 20% of the total surface of the affected slope. **Under what circumstances would the General Plan provide for building and road construction on slopes of more than 30%? How can soils be effectively protected on such slopes if building and road construction are allowed?**

I17-558  
cont'd

**IM#54, p 8-33:** “The County shall work with funding sources and organizations . . . to provide resources to implement the plans and programs of the Environmental Resources Management Element.” How will the County work with these organizations? For example, in 2009, Sequoia Riverlands Trust and TCCRG offered to write an Oak Woodlands Management Plan for the County, so that funding could be applied for on a voluntary basis by landowners wishing to conserve oak woodlands on their property. The County said that would be a priority. The date for working on an OWMP has now been changed from 2010-2015 in the 2008 GPR to 2015-2020 in the current version. **What is meant by “work with?”**

I17-559

## 9. AIR QUALITY (GPR p. 9-1 ff):

Global climate change, the health and welfare of its citizens, the health and sustainability of its flora and fauna, and the requirements of AB32 and its Climate Action Plan necessitate the County’s taking a bold, pro-active leadership role in addressing this issue, which is a the top priority of the people.

I17-560

### KEY TERMS (GPR p. 9-1 ff):

**Please include in the definitions of the Key Terms sufficient factual and consequential information to enable readers to understand why the terms are being discussed and why the General Plan must promptly and forcefully address Global Climate Change, Global Warming, and Greenhouse Gas Emissions.** Most General Plan readers will never read the Background Report and the EIR. They need to find relevant information for understanding and decision-making in the GPR. (The Background Report and EIR are also deficient in these respects, as will be discussed in more detail below.)

I17-561

**It is imperative that the General Plan disclose and discuss the effects on human and environmental health, and on the economy, of poor air quality in general and of key pollutants in particular, and that it also fully discuss the effects of pollution on crop production, tourism, health care, and other sectors of the economy, and that it adopt and implement all feasible mitigating policies and implementation measures (which are to be reflected in our GPR’s Policies and Implementation Measures) to address the costs and consequences of air pollution and GHG emissions.**

I17-562

119

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

These comments on the GPR definitions and Air Quality/Climate Change discussion apply also to those in the Background Report and RDEIR, which tend to be just as lax as those in GPR in terms of providing clear, consequential meaning and discussion, so that the reader understands their significance. The Background Report and the RDEIR are seriously inadequate and deficient in disclosing the nature, extent, and significance of these impacts, and the GPU and RDEIR are seriously inadequate and deficient in providing Policies and Implementation Measures that will meaningfully and effectively address these impacts. They must be extensively revised to address these most urgent matters that so profoundly impact Tulare County's quality of life, economy, and environment.

I17-563

**Carbon Dioxide (CO2) (p. 9-1):** This definition was written in the 2008 version so as to give the impression that human-caused emissions of CO2 as a GHG are virtually insignificant and therefore need not be addressed. This is dangerously and irresponsibly deficient and misleading information. Thank you for improving the definition in the current version.

I17-564

**This Key Term's definition must be re-written to meaningfully address the significance of CO2 as a GHG and agent of global warming.** The point is that until recently Earth's CO2 was in balance; over the last dozen or so decades, burgeoning human population, industrialization, conversion of natural lands, and burning of fossil fuels has emitted so much CO2 that it has begun to throw the Earth's CO2 system out of balance, resulting in accelerating climate change (global warming) that will drastically impact human comfort, health, livelihood, and even survival all over the planet (not to mention all the other living things on board). Human civilization has evolved and thrived under a climate regime that has been relatively stable for over 650,000 years. In the last few decades change has occurred far beyond the bounds of any previous change in that 650,000 year period, and human activities are contributing significantly to that change. The effects of that change are already impacting Tulare County. (See Global Warming definition below for additional information.)

**Carbon Monoxide (p. 9-1):** Please add to this definition the following information so that the reader may understand WHY CO is being discussed: "Carbon monoxide reduces the ability of blood to deliver oxygen to vital tissues, affecting the cardiovascular and nervous system; it impairs vision, causes dizziness, and can lead to unconsciousness or death." Why has the more detailed source information for CO that appeared in the 2008 GPR been deleted? Please restore it.

I17-565

**Class 1 Designation:** Why has this definition been deleted? It appeared on p. 9-1 in the 2008 version and is important information of Tulare County, which hosts two national parks and extensive wilderness areas. Please restore this definition to the current GPR.

I17-566

**Climate Change (p. 9-1):** Please revise this vague and dry definition, which seems designed to disguise and diffuse the significance of this phenomenon. This definition must state that Global Climate Change is occurring because of persistent anthropogenic changes to the composition of the atmosphere, namely the increase of GHG emissions, which has thrown Earth's atmosphere out of balance.

I17-567

**Please add a Key Term (p. 9-2) and discussion as follows:** "Costs of Poor Air Quality: Many studies have shown the costs of poor air quality in our area, as indicated by the following examples: A recent CSU Fullerton study showed that the health-related impacts of air pollution drain the San Joaquin Valley's economy of **\$6 billion every year**. That's the cost of shortened life spans, hospitalizations, job absences, school absences, and other economic and health effects of the region's chronically poor air quality.

I17-568

The Valley's annual school absenteeism due to asthma totals about 808,000, accounting for **lost revenue to regional school districts** of at least \$26 million annually (not to mention the students' lost learning days). The **financial cost of asthma** to four Valley cities alone exceeded \$85 million per year (this is not to mention the suffering of those afflicted with asthma).

The study found that every resident in the San Joaquin Valley is exposed to life-threatening pollutants on a regular basis, and the cost of air pollution in the San Joaquin valley exceeds \$1600 per person per year.

**According to the Air District, ozone pollution causes as much as \$270 million a year in damaged agricultural crops in the Valley.** Harvests of crops such as grapes, cotton, tomatoes, oranges, and alfalfa can be reduced 10-20% as a result of air pollution.

I17-569

In California, respiratory illnesses **caused or exacerbated by airborne particulate matter** are responsible for 9,300 deaths, 16,000 hospital visits, 600,000 asthma attacks and 5 million lost work days each year, **costing more than half a billion dollars a year**. A recent analysis of **diesel particulate matter** pollution attributed approximately 3,000 premature deaths per year to this pollutant alone, with about 260 of those deaths occurring in the SJV. One hundred percent of the residents of Tulare County are exposed to PM 2.5 annually.

I17-570

A recent study by the RAND Corporation showed that between 2005 and 2007 Medicare spent an estimated \$104 million, Medi-Cal spent about \$28 million, and private health insurers spent about \$56 million in this period on hospital care *because California failed to meet federal clean air standards*.

I17-571

Our **national parks**, forests, and monuments suffer from the poor air quality we create with our GHG emissions. Sequoia and Kings Canyon National Parks have been listed as among the five most polluted national parks in the country, and in the past several years have had more days exceeding the federal health standard for ozone than any other National Park Service unit in the country. This poor air quality and often greatly reduced visibility negatively affect **tourism**, not to mention the health of our parks and their hundreds of thousands of annual visitors.

I17-572

Our **national parks**, forests, and monuments suffer from the poor air quality we create with our GHG emissions. Sequoia and Kings Canyon National Parks have been listed as among the five most polluted national parks in the

121

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

country, and have had the second highest annual average ozone level of any national parks. This poor air quality and often greatly reduced visibility negatively affect **tourism**, not to mention the health of the parks.

I17-572  
cont'd

**Economic development and business recruitment** will be difficult in an area plagued by unhealthy air quality. If we do not succeed in implementing programs to reduce emissions from mobile sources, then we will have to reduce the emissions from job-producing stationary sources. If we do not attain air quality standards, then Federal sanctions may be imposed that limit stationary source expansion (which could make most industrial expansion prohibitively expensive) and withhold highway funds. **The great challenge is to drive less, so we must plan, develop, and manage our communities to make it easy for people to walk, bicycle, or use public transit."**

This information should be added here to the Key Terms section and/or discussed elsewhere in the Air Quality element and must also be included in the Background Report and the EIR. Information about the costs of poor air quality is critical to understanding the issue and to policy-making and evaluating mitigation measures and effective implementation measures. **The EIR and the Background Report are deficient because they contain no discussion of the costs of poor air quality.** (Table 6-1 on pp. 6-6 – 6-7 of the Background Report does briefly note some of the adverse health impacts of air pollutants.)

I17-573

**Global Warming (p. 9-2):** Although it has been revised, this continues to be an insufficient and misdirected definition of global warming that must be almost completely rewritten in order to make it accurate and relevant. **Please include the following** or comparable statements of findings by the legislature of the State of California, the IPCC, the State Attorney General, and the California Climate Change Center:

I17-574

**"Overwhelming evidence establishes that global warming is occurring and is caused by human activity. Global warming poses a serious threat to the economic well-being, public health, natural resources, and environment of California.** Temperatures are expected to rise 4.7 to 10.5 degrees by the end of this century. These increases will have serious consequences, including the exacerbation of air quality problems, a reduction in the quality and supply of water, a shrinking Sierra snowpack, an increase of as much as 55% in the risk of large wildfires, increased stress on the state's vital resources and natural landscapes, an increase in human health-related problems (including increased incidences of infectious diseases, asthma, heat stress and heat-related deaths), damage to agriculture (from increasing heat, pests, pathogens, and weeds), wine making, tourism, skiing and other winter recreation, forestry, and fishing, and a potential reduction in hydropower. It will also cause a rise in sea levels resulting in the displacement of thousands of coastal businesses and residences, shrinking beaches, and increased coastal floods. **The existence of global warming is indisputable, it is causing significant environmental impacts in California, and it will cause future catastrophic impacts if greenhouse gas emissions levels are not substantially reduced."**

**This information must also be included in the Background Report (see, e.g., p. 6-31, which presents only a watered-down, version of some of this information).** | 117-574 cont'd

**Greenhouse Effect (p. 9-2): Please revise to state that the concentration of GHG *is* rising and *is* causing the average temperature to increase, which is causing significant environmental impacts in California, and will cause future catastrophic impacts if GHG levels are not substantially reduced.** | 117-575

**Greenhouse Gas (p. 9-2): Please add this or a comparable statement to aid the reader's understanding of the relevance of this definition:**  
 "In June, 2005, the Governor of California issued Executive Order S-3-05, setting emission reduction targets for California: by 2010, reduce GHG emissions to 2000 levels; by 2020, reduce emissions to 1990 levels; by 2050, reduce emissions to 80% below 1990 levels. In September, 2006, California's Global Warming Solutions Act (AB32) was signed into law, requiring reduction of California GHG emissions to 1990 levels by 2020. It should be noted that about 80% of California's CO2 equivalent GHG emissions are emissions of CO2 from fossil fuel combustion. In the unincorporated area of Tulare County, 63% of GHG emissions come from confined animal facilities, such as dairies and feedlots. See page 9-4 for additional information." | 117-576

**Please add to Key Terms on p. 9-2: "Methane. Methane accounts for approximately 5.7% of all GHG emissions in California, and half of the State's methane emissions comes from livestock and manure. Methane is a powerful GHG that has 21 times the global warming potential of carbon dioxide. Livestock and their manure emit GHGs equivalent to 13.2 million tons of carbon dioxide each year in California."**  
 [From letter by State Attorney General to RMA, dated 2/26/07, re NOP for Buena Vista Dairy] | 117-577

**Sulfur Dioxide (H2S) (p. 9-2): Please add: Sulfur dioxide levels are generally highest near large industrial complexes. Exposure to very high levels may cause wheezing, chest tightness, and shortness of breath. Long-term exposure can cause respiratory illness, alter the lungs' defense mechanisms, and aggravate existing cardiovascular disease."** | 117-578

**Lead (Pb) (p. 9-2): Please add: "Since the phase-out of leaded gasoline, metals processing is the major source of lead emissions to the air today, with the highest levels generally found near lead smelters; other stationary sources are waste incinerators, utilities, and lead-acid battery manufacturers. Lead can enter water systems through runoff and from sewage and industrial waste streams and is still found at high levels in urban and industrial areas; it deposits on soil and in water and harms animals and fish, and particularly affects young children and infants, causing learning deficits and lowered IQs. Exposure to lead causes damage to the kidneys, liver, brain, nerves, and other organs, and may lead to osteoporosis and** | 117-579

reproductive disorders; it causes high blood pressure and increases heart disease, and may lead to anemia. Excessive exposure causes seizures, mental retardation, behavioral disorders, memory problems, and mood changes. Low levels of lead can slow vegetative growth near lead sources. Wild and domestic animals can ingest lead while grazing, or may ingest it when feeding on animals killed by lead bullets; they experience the same kind of effects from exposure as people do.”

I17-579  
cont'd

**Mobile Source (p. 9-2): Please add:** “Mobile emission sources account for a very significant percentage of CO<sub>2</sub> GHG emissions, so we must focus on these sources in our efforts to combat global warming and air pollution. In the San Joaquin Valley, emissions from mobile sources such as cars, trucks and equipment represent almost 70% of the air pollution challenge. In just 20 years, the Valley’s population has grown by 60%, and daily vehicle miles traveled has increased by 150%.”

I17-580

**Nitrogen Oxides (NO<sub>x</sub>) p. 9-2): Please add:** “The primary manmade sources of NO<sub>x</sub> are motor vehicles, electric utilities, and other industrial, commercial, and residential sources that burn fuels (natural gas burning appliances used for space heating, water heating, and cooking are a source of NO<sub>x</sub> emissions, and our consumption of electricity also causes pollutant emissions from the operation of power plants fueled by fossil fuels). NO<sub>x</sub> causes a wide variety of health and environmental impacts because of various compounds and derivatives in the family of NO<sub>x</sub>, including NO<sub>2</sub>, nitric acid, nitrous oxide, nitrates, and nitric oxide. NO<sub>2</sub>, a common pollutant, forms, along with air particles, a reddish brown layer that can often be seen over many urban areas. Ground-level ozone (smog) is formed when NO<sub>x</sub> and VOCs react in the presence of sunlight. Children, people with lung diseases such as asthma, and people who work or exercise outside are susceptible to adverse effects such as damage to lung tissue and reduction in lung function. Ozone also damages vegetation and reduces crop yields. Nitric acid affects breathing and the respiratory system, damages lung tissue, and can cause premature death; small particles penetrate deeply into the lungs, causing or worsening respiratory diseases such as emphysema and bronchitis, and aggravating existing heart disease. Nitrous oxide is a Greenhouse Gas, contributing to Global Warming. NO<sub>x</sub> reacts readily with common organic chemicals and even ozone to form a wide variety of toxic products, some of which may cause biological mutations. Nitrate particles and NO<sub>2</sub> can block the transmission of light, reducing visibility in urban areas and on a regional scale in our national parks, forests, and monuments.”

I17-581

**Ozone (O<sub>3</sub>) (p. 9-2): Please add:** “Ozone occurs both in the Earth’s upper atmosphere (beneficially) and at ground level (unhealthfully, due to air pollutants). Ground level ozone affects people of all ages who are active outdoors, and particularly children, because during physical activity ozone penetrates deeper into the more vulnerable parts of the lungs. Ozone can cause itchy, watery eyes; irritate the respiratory system, causing coughing, throat irritation, and chest discomfort; ozone can reduce lung function, making it

I17-582

124

more difficult to breathe deeply and vigorously; aggravate asthma; and make people more sensitive to allergens and more susceptible to respiratory infections; repeated exposure to ozone can permanently scar lung tissue, resulting in permanent loss of lung function and a lower quality of life. Respiratory illnesses, asthma attacks, and impaired lung function and growth lead to emergency room visits, hospitalizations, and premature death. In its State of the Air 2010 report, the American Lung Association gave Tulare County a grade of 'F' for ozone pollution in 2006-2008 because the County had 253 days that were rated on the Air Quality Index as 'unhealthy for sensitive groups' (children, the elderly, active adults, and people with respiratory disease such as asthma – these groups comprise well over half of Tulare County's population), 49 days that were rated 'unhealthy' for everyone, and 2 days that were rated very unhealthy due to high ozone levels.

I17-582  
cont'd

**O3 Precursors (p. 9-2): Please add:** *"The Federal Clean Air Act mandates us to reduce emissions of ozone precursors by at least 3% per year until air quality standards are attained."* [per SJVAPCD]

I17-583

**Please add: "Particle Pollution (p. 9-3):** Short-term particle pollution can kill, on the day that particle levels are high, or within one to two months afterward. These are deaths that would not occur if the air were cleaner. Scientists at the California Air Resources Board have tripled their estimate of the number of deaths occurring in California each year from particle pollution: they now put the range between 5,600 to 32,000 deaths per year. Particle pollution also diminishes lung function, causes greater use of asthma medications and increased rates of school absenteeism, emergency room visits, and hospital admissions. Particle pollution causes heart attacks, strokes, heart disease, and congestive heart failure, worsened asthma, worsened COPD, and inflammation. The elderly, people with heart disease, children, diabetics, and women over 50 are at higher risk, along with workers whose jobs routinely expose them to heavy diesel exhaust. Studies show that living near highways is especially dangerous. The American Lung Association gave Tulare County a "Fail" rating for High Particle Pollution Days, 2006-2008, with 43 days rated unhealthy for sensitive groups (children, the elderly, persons with existing lung [information from American Lung Association State of the Air 2010] disease – these groups comprise well over half of Tulare County's population) and 2 days as unhealthy for all."

I17-584

**Particulate Matter 2.5 Micrometer (PM2.5) (p. 9-3): Please add:** "PM 2.5, also known as soot, is expelled from tailpipes, factory smokestacks, farm equipment, agricultural burning, dust, and other sources. Particle pollution includes a mixture of solids and liquid droplets, some emitted directly while others are formed in the atmosphere when other pollutants react. When inhaled, because of its small size, it can penetrate deep into the lungs; it is linked to severe asthma and premature deaths from heart and lung disease. Particle pollution also can increase susceptibility to respiratory infections and can aggravate existing respiratory diseases, such as asthma and chronic bronchitis, and heart diseases such as congestive

I17-585

heart failure and coronary artery disease, and triggers heart attacks, strokes, and irregular heartbeat, increasing emergency room visits, hospitalizations, and premature deaths. Particle pollution is the most dangerous, and deadly, of the widespread outdoor air pollutants. It also reduces visibility and may cause soiling of surfaces.”

I17-585  
cont'd

**Particulate Matter 10 Micrometers (PM10) (p. 9-2): Please add:** “Particle pollution (particulate matter) in the air includes a mixture of solids and liquid droplets, some emitted directly, others formed in the atmosphere when other pollutants react. Their sources include combustion, industrial and agricultural fumes, and dust. Particles smaller than 10 micrometers in diameter (PM 10) are so small that they can get into the lungs, increasing susceptibility to respiratory infections and aggravating existing respiratory diseases. People with heart or lung diseases – such as congestive heart failure, coronary artery disease, asthma, or chronic obstructive pulmonary disease, when exposed to particulate matter, are more likely to visit emergency rooms, be admitted to hospitals, or even to die

I17-586

**Please add as a Key Term (p. 9-3): “Pesticides.** Pesticides are the fourth biggest cause of air pollution, or “smog,” in the San Joaquin Valley. Tulare County used more than 17.5 million pounds of pesticides in 2005, the third highest use of any county in California. Pesticides can cause immediate poisoning, cancer, Parkinson’s disease, birth defects, sterility, neurotoxicity, and permanent, irreversible damage to developing children; pesticides can aggravate asthma and other respiratory problems. Over 90% of pesticides used in California drift very easily away from where they are applied. For example, pesticides drifting from the Valley are degrading the resources in Sequoia and Kings Canyon National Parks.”

I17-587

**ROG (p. 9-3): Please add:** “ROG is the abbreviation for Reactive Organic Gases, which result from combustion, industrial solvents, and biological and agricultural sources, including animal waste, agricultural chemical formulations, and other combustion. Dairies are presumed to be significant emitters of ROG.”

I17-588

**Sensitive Groups (p. 9-3): Please add:** “The Valley has the highest child asthma rate in California; up to 1 in 5 Valley children suffer from asthma and up to 1 in 8 adults, and there are more than 1200 premature deaths each year in the Valley due to particulate matter pollution. Thirty-four percent of Tulare County’s population is under age 18, and 13% is age 65 and older, totaling 47%; this doesn’t count the tens of thousands of individuals in between these age groups who have respiratory problems.”

I17-589

**Stationary Source (p. 9-3): Please add** *agricultural irrigation pumps and confined animal facilities, such as dairies and feedlots* , as they are significant sources in Tulare County.

I17-590

**Transportation Conformity (p. 9-4): Please revise** this definition, which is confusing, as follows:  
 “Transportation Conformity is required by the Clean Air Act to ensure that Federal funding and approval are given to highway and transit projects that conform to the air quality goals established by a State Air Quality Plan (SIP). Conformity means that transportation activities will not cause new air quality violations, worsen existing violations, or delay timely attainment of the national ambient air quality standards. This requirement connects air quality and transportation planning.”

I17-591

**Existing Conditions Overview (p. 9-4): Please add:** In a list of the 25 U.S Cities Most Polluted by Short-term Particle Pollution (24-hour PM2.5), in 2008, the Visalia-Porterville Metropolitan Statistical Area ranked 8<sup>th</sup>; it ranked 3<sup>rd</sup> in the 25 Cities Most Polluted by Year Round Particle Pollution (Annual PM2.5) and Most Ozone-Polluted Cities. In the same categories of the 25 U.S. Counties Most Polluted, Tulare County ranked 9<sup>th</sup>, 5<sup>th</sup>, and 4<sup>th</sup>. [see CARB website and American Lung Assn.] “Tulare County experiences some of the worst health conditions in the state, with avoidable hospitalizations about 20% higher than the statewide average, including diagnoses of asthma, COPD, congestive heart failure, diabetes mellitus, and hypertension [*Health in the Heartland: The Crisis Continues*]. Our vehicle-oriented development contributes hugely to greenhouse gas emissions and lack of exercise, which lead to medical problems. Our incidence of asthma is as high as one in five affected.”

I17-592

**Existing Conditions Overview (p. 9-4):**

**PM2.5: Please amend:** “Tulare County is in non-attainment with federal standards, *and also exceeded the State 3-year maximum average on 23 days in 2004, 20 days in 2005, and 20 days in 2006.* **Please add:** “In a list of the 25 U.S Cities Most Polluted by Short-term Particle Pollution (24-hour PM2.5), in 2008, the Visalia-Porterville Metropolitan Statistical Area ranked 8<sup>th</sup>; it ranked 3<sup>rd</sup> in the 25 Cities Most Polluted by Year Round Particle Pollution (Annual PM2.5) and Most Ozone-Polluted Cities. In the same categories of the 25 Counties U.S. Counties Most Polluted, Tulare County ranked 9<sup>th</sup>, 5<sup>th</sup>, and 4<sup>th</sup>”

I17-593

**The second paragraph of the Overview (p. 9-4)** states that ROG from natural sources (mainly from trees and plants) is the largest source of ROG in Tulare County. This does not take into account the significant air cleaning and carbon sequestering effect of trees and plants, a virtue not shared by mobile sources of ROG. Please mention this compensating factor, so that readers won’t be led to think that we need to get rid of our trees and plants.

I17-594

**Existing Conditions Overview (p. 9-6, last paragraph):** The problem with the “featured policies and implementation measures” is that while they often sound good (such as by using attractive terms such as “smart growth” and “healthy communities”) they are far too often vague, weak, and unenforceable; too often they do not even have implementation measures, and far too many of the implementation measures that are presented are not concrete, not measurable, and/or not to be timely effectuated; thus they are unlikely to

I17-595

127

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

enable the County to effectively “comply with State law requirements” and to “enhance the quality of life and public welfare of County residents.” Please see comments on individual policies and implementation measures throughout the GPR. | 117-595  
cont'd

It is very misleading, for example, to state here that “some of the featured policies direct growth into compact areas such as urban development boundaries or corridors,” when the County is proposing development in many areas *outside* of current urban development boundaries, creating new hamlet development boundaries, proposing new development along all our highways, and providing for entire New Towns. Many of these don't appear to be compact areas at all, and the County's proposed average densities are extremely low. | 117-596  
Please clarify, strengthen, and make measurable and enforceable these policies and implementation measures.

Additionally, somewhere in the Air Quality element, perhaps in the Existing Conditions Overview, or else in the policy portion, the GPR should discuss and address the impacts of agriculture on air quality. The Air Quality Element deals with Regional Perspective, Transportation Design, Land Use/Design, and Air Pollution Control, but never mentions agriculture directly. SB 700 and the County's ACFP and its DSPEIR should be mentioned in this Element. | 117-597

SB 700 states that:

“Agricultural operations necessary for growing crops or raising animals are a significant source of directly emitted particulates, and precursors of ozone and fine particulate matter. These emissions have a significant adverse effect on the ability of . . . the San Joaquin Valley to achieve health-based state and federal ambient air quality standards. . . . agricultural sources of air pollution still contribute twenty six percent of the smog-forming emissions in the San Joaquin Valley. In the San Joaquin Valley, a large portion of the sources of particulate emissions are areawide sources whose emissions are directly related to growth in population and the resulting vehicle miles traveled. According to the State Air Resources Board, however, agricultural sources of air pollution account for over fifty percent of the directly emitted particulate air pollution generated in the valley during the fall, amounting to over 170 tons per day of emissions.” | 117-598

All parties living or operating a business in an area that has been classified as being a nonattainment area with respect to the attainment of federal or state ambient air quality standards share the responsibility of reducing emissions from air pollutants. . . . It is therefore the intent of the Legislature to . . . to regulate stationary, mobile, and area sources of agricultural air pollution. . . . Each district that is designated as a serious federal nonattainment area for an applicable ambient air quality standard for particulate matter as of January 1, 2004, shall adopt . . . a rule or regulation requiring best available control measures (BACM) for sources for which those measures are applicable and best available retrofit control technology (BARCT) to reduce air pollutants from sources for which that technology is applicable for agricultural practices, including, but not limited to, tilling, discing, cultivation, and raising of animals, and for other source categories by the earliest feasible date, but not later than January 1, 2006.”

Tulare County benefits from agriculture, but agriculture also costs the County. As a significant contributor to our air quality problems and our GHG emissions, **agriculture must be discussed in the Air Quality Element, and the GPR must indicate what policies apply to this industry.** With well over a million head of dairy cows projected for Tulare County in the near future (ACFP DSPEIR, Table 3-14a), the dairy industry alone, just one part of the County's agricultural sector, will have a huge adverse impact on our air quality.

I17-599

**Agriculture's effects on air quality and GHG emissions must also be discussed in the Background Report and the RDEIR.** These documents are inadequate and deficient without this information, and the impacts must be made clear in order to be effectively addressed by the RDEIR and the GPR.

I17-600

**AQ-1.1 Cooperation with Other Agencies (p. 9-7):** This Policy is extremely vague. **It should state how the County "shall cooperate" with other agencies to develop and implement air quality plans and how it "shall partner" with other agencies to achieve better air quality conditions.** Is the County taking an active role? We have heard a sitting member of the Board of Supervisors state that air quality is the Air Board's job. **This General Plan Update provides a very important opportunity for the County to develop and implement a plan that will achieve better air quality conditions, but the GPU is clearly not focused on this objective, which is also critical to achieving "better air quality conditions locally and regionally."**

I17-601

Instead of directing new growth and development into existing urbanized areas where jobs, infrastructure, and services already exist, this GPU promotes development all along our County's highways and allows New Towns to be built apparently almost anywhere. This type of development will unnecessarily convert agricultural and open space lands to urbanization, unnecessarily increase VMTs and GHGs, and do nothing to promote public and active transit.

I17-602

**This GPU makes no sustained, strong, consistent effort to comply with AB32, SB375, the County's Climate Action Plan, or the people's highest priorities, nor does it make a strong, good faith effort to cooperate in the regional effort to create transit-friendly, compact, walkable, infill development that will help to improve air quality in the Valley air basin that it shares with 7 other counties (its nearest neighbors, Kern and Fresno, being close competitors for having the worst air quality in the nation).. Its proposed average density standard of 5.3 du/acre, for example, is half-hearted and should be raised to the Regional Blueprint average of 6.8 du/acre or better.**

I17-603

**IM#1 (p. 9-11)** says the County will work with TCAG to develop an "enhanced public information program aimed at reducing trips and improving air quality awareness." **This measure was evidently proposed by Resolution in 2004. It was scheduled for implementation in 2007-2010 in the 2008 version. It is now scheduled for implementation in 2010-2015. This evidences very little determination on the County's part to educate and influence the public. The County should be leading by example in this area, implementing in its own operations trip reduction and emissions reduction, and publicizing its success. The GPU process offers an excellent opportunity to inform the**

I17-604

public, but the County is not publicizing it, and the GPU itself is not well aimed at reducing trips and improving air quality awareness.	117-604 cont'd
IM#2 (p. 9-11): As for cooperation with other agencies and jurisdictions, why has the County deleted the IM that was #2 in the 2008 GPR (p. 9-8)? The former IM#2 said, "The County shall communicate and cooperate with surrounding cities and counties by becoming an active member of the SJVAB Coordinating Council in order to promote regional air quality planning management." The current IM#2 (p. 9-11) corresponds to the former IM#3, but the 2010 version differs from the 2008 version, which said that, "The County shall investigate the feasibility of providing financial or other incentives to cities and communities in the County that practice air quality sensitive development." The 2010 version changes this to providing incentives to "hamlets and communities." Why has this change been made? Please revise the timeline for this IM.	117-605
The County apparently resolved in 2004 to investigate the feasibility of providing incentives in 2004. The 2008 GPR scheduled this investigation for 2010 to 2015. The current version changes the timeline to 2015-2020. This strongly indicates that the County has little interest in even "investigating" incentives for air quality sensitive development, much less actually implementing any such program. The public and the County's regional neighbors would like to rely on the County to act meaningfully in this area. Please modify these inadequate IMs.	117-606
AQ-1.2 Cooperation with Local Jurisdictions (p. 9-7): This Policy must be clarified and strengthened. How will the County "participate?" How will it "address" cross-jurisdictional transportation and air quality issues? Please see comments directly above on IM#1 and #2 (and on the 2008 IM#2).	117-607
The <u>BACKGROUND REPORT</u> is extremely deficient and inadequate in its Air Quality section. It provides dry as dust definitions of its Key Terms, almost never giving any indication at all of how the pollutants, geography, legislation, or organizations mentioned actually impact the reader's life daily and the public, economic, and environmental health of Tulare County.	117-608
For example, on page 6-6, in Table 6-1, it describes Ozone's Pollutant Health and Atmospheric Effects" in words such as "Risk to public health implied by altered connective tissue metabolism and altered pulmonary morphology in animals . . . and pulmonary function decrements in chronically exposed humans." This, of course, does not make clear to the reader the health effects of ozone: that ozone can cause itchy, watery eyes; irritate the respiratory system, causing coughing, throat irritation, and chest discomfort; ozone can reduce lung function, making it more difficult to breathe deeply and vigorously; aggravate asthma; and make people more sensitive to allergens and more susceptible to respiratory infections; repeated exposure to ozone can permanently scar lung	117-609

tissue, resulting in permanent loss of lung function and a lower quality of life. Respiratory illnesses, asthma attacks, and impaired lung function and growth lead to emergency room visits, hospitalizations, and premature death

I17-609  
cont'd

**For example, the “County Responses to Air Quality Conditions” section (BR p. 6-16 ff) starts off with a list of EPA actions re ozone classification. On page 6-17, it states that “The County continues to evaluate and consider a variety of federal, state, and SJVAPCD programs in order to respond to the non-attainment designation . . . and will continue to adopt resolutions to implement these programs.” It then lists the RACMs listed in a March, 2002 County Resolution and a 2004 Resolution. Then it moves on to PM10. Never does it discuss whether any of the RACMs were actually implemented and with what results.**

I17-610

**For example (p. 6-18), was transit service to Woodville, Poplar, and Cotton Center increased? If so, when and by how much, and with what results? Were three new buses purchased? If so, when, and where do they go, and have they helped air quality? Were they “clean” buses (such as CNG?) How many additional bike racks were installed on buses? Are they being regularly used? What kind of public outreach has been made? When was the outreach made? Was there a response? Has preferential parking for carpools and vanpools been provided? If so, where and how much? Is it being regularly used by carpools and vanpools? Where has on-street parking been removed in order to provide bus pullouts in curbs? How many parking spaces have been converted to bus pullouts? How many hybrid vehicles have been purchased for the County fleet? When were they acquired? What percentage of the fleet is now hybrid? What are the results? How is the General Plan Update implementing land use policies supporting public transit and vehicle trip reduction? What are the expected results? What are the results of the \$13,264,000 of highway widening projects to reduce entrained road dust from unpaved shoulders? How many miles were completed, when and where?**

I17-611

**As for the follow up Resolution of 2004 (p. 6-18), it is so vague that it is hard to say how one could tell whether it has served to accomplish anything concrete and measurable. Its RACMs include “development and implementation of recommended procedures, thresholds, and policies related to land use projects to help achieve air quality goals.” Have these been developed and implemented? If so, where are they, and when did they become effective? What results have they produced? What about “encouraging land use patterns which support public transit and alternative modes of transportation” and “exploring concepts of Livable Communities” and “consideration of incentives” and “exploring ways to enhance incentives?” It’s been 6 years since this Resolution was adopted. What precisely has been the effect of its RACMs in improving the County’s air quality? What has actually been achieved as a result of this “encouraging” and “exploring” and “considering?”**

I17-612

**A review of the Implementation Measures in the GPR Air Quality section shows that of the 17 listed (including 2 that are new and appear only in the RDEIR) only 5 are not listed as “ongoing,” and far too many are as vague as the list in the 2004 Resolution (“work with TCAG to develop a program,” “consider standard methods for determining and mitigating project air quality impacts and related thresholds of significance,” “continue**

I17-613

131

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

to remove debris after wind or rain,” “continue to provide water trucks at refuse sites,” “conduct a periodic review of its existing hybrid and alternative fuels vehicles,” “develop and implement an outreach program,” “continue to evaluate and implement flexline[“flextime?”] programs,” “identify opportunities for infill sites,” “work with TCAG in refining and maintaining a current set of RACM and BACM that can be used in reviewing and conditioning transportation and circulation projects.”

I17-613  
cont'd

**Has the County made any real , innovative progress** in reducing air pollution and correspondingly improving public health, safety, and welfare, environmental health, and the related economic impacts? **Has it demonstrated initiative and leadership and provided a good example**, or is it continuing mainly to make vague gestures and mouth the right words while doing at the most only the minimum required by law?

**The Background Report needs to be rewritten to provide a clear picture** of Tulare County’s air quality situation, its effects, and what is actually being done about it.

I17-614

**AQ 1.3 Cumulative Air Quality Impacts (p. 9-7):** If the County indeed will “require developments to be located . . . in a manner that would minimize cumulative air quality impacts,” then the County must firmly restrict new development to within existing UDBs and the new HDBs (which probably should be shrunk to promote compact and efficient development), as close as possible to existing jobs, infrastructure, and services, and require new development to be concentric, compact, infill, mixed-use, higher-density, properly-oriented for energy efficiency, transit-oriented, walkable and bikeable, and resource-efficient. **Please revise accordingly.**

I17-615

The second sentence notes that CEQA requires alternatives to be proposed. **Please clarify this sentence. Does it mean to say that all applicants for development will be required to have their projects reviewed under CEQA?** If not, **state which projects will require CEQA review.** Once the alternatives are proposed, how will the County select an alternative to approve? **Does this Policy require the County to always select the alternative that would minimize cumulative air quality impacts?** If not, **please clarify how the CEQA alternatives relate to County action on development proposals.**

I17-616

**IM#3 (p. 9-11)** says that the County “shall review all discretionary permit applications to consider cumulative air impacts through the CEQA process, and require the preparation of an EIR with alternatives if a fair argument can be made that there will be significant impacts on air quality.” This is shown as a “new” program that is “ongoing.” **Please revise this IM to specify the following:** How long has this process been required by law? **Who will determine whether “a fair argument can be made”** that there will be “significant” impacts on air quality? **In a county with air quality as poor as Tulare County’s, how is the significance determination made?**

I17-617

**IM#4 (p. 9-11):** The 2008 version of this IM (#5, p. 9-8 of the 2008 GPR) said that “The County . . . *shall develop* standard methods.” The 2010 version says that the County “*shall consider* standard methods.” **Please explain why this wording has been changed and clarify the meaning of this IM. Does this mean that the County shall consider developing standard methods, or that the standard methods have now been developed and the County will be applying them? If the County has standard**

I17-618

methods of determining and mitigating project air quality impacts and related thresholds of significance, what are they, and where can the public read them? Please include this information in this IM. The timeline has been changed from 2007-2010 to 2010-2015, which implies that the standard methods have not yet been developed.

I17-618  
cont'd

**AQ-1.4 Air Quality Land Use Compatibility (p. 9-7): Please add:** *"In order to promote compliance with the requirements of AB32 and its Climate Action Plan, and to protect the health, safety, and welfare of its residents and the overall health and sustainability of its environmental resources, the County shall strongly discourage industrial or other developments which are likely to cause undesirable air pollution, and shall concentrate on attracting industrial and other developments that will cause minimal air pollution. The County shall permit industrial or other developments likely to cause undesirable air pollution only on the condition that such development comply with all feasible BACMs in order to minimize air pollution."* Tulare County's air quality is so poor and so costly that the County must make every possible effort to minimize additional adverse impacts.

I17-619

**AQ-1.6 Purchase of Low Emission/Alternative Fuel Vehicles (p. 9-7) and IM #7 (p. 9-12): Please change** "encourage" to "require." Surely this is one thing the County can do immediately to mitigate air quality problems, reduce GHG emissions, set a good example, and save on fuel costs.

I17-620

says only that the County will conduct a periodic review of its existing hybrid and alternative fuels vehicles; the timeline is Ongoing. Since most of the County's few hybrid/alternative fuel vehicles appear to have been purchased in 2001 and 2002 (per its draft Facilities Impact Fee study), presumably the ongoing periodic reviews have already revealed whether the performance and maintenance characteristics of these vehicles have proven satisfactory. Frustratingly, **this Policy and its IM, do not commit the County to any concrete, enforceable, measurable plan of action to achieve an important goal.** **Recommendation:** As a minimum, the County should adopt SJVAPCD Policy 20 (County fleet vehicle operators shall replace or convert conventional fuel vehicles with clean fuel vehicles as rapidly as feasible) and its three implementation strategies, from the SJVAPCD's "Air Quality Guidelines for General Plans" (revised June, 2005). This document (although with a 2003 date) is referenced on p. 6-12 of the Background Report. It contains 34 recommended policies for counties to adopt, a number of which Tulare County has included in the GPR.

**AQ-1.7 Support Statewide Climate Change Solutions (p. 9-75): Please revise this very vague and confusing statement, which seems designed to obfuscate and avoid the issue. The CARB has already formulated and published numerous mitigation strategies (many of which have been obvious for years and promulgated by many other sources) that may be implemented by local government.** The time has passed for the County to simply "consider" them. **The County must resolve to implement as many of them as it feasibly can as fast as it possibly can,** in order to comply not only with AB32 and its new Climate Action Plan, but with the priorities of its

I17-621

133

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

populace, and with its responsibility for promoting the health, safety, and welfare of its citizens. **We need a General Plan with strong, clear policies and concrete, measurable, enforceable, timely implementation measures to accomplish this.** There is no IM for this Policy.

I17-621  
cont'd

On page ES-8, etc. of the RDEIR, as part of Table ES-3-Required Additional Mitigating Policies and Implementation Measures, **AQ-1.7 appears with revised text** as follows: "The County shall monitor and support the efforts . . . *to develop a recommended list of emission reduction strategies. As appropriate, the County will evaluate each new project under the updated General Plan to determine its consistency with the emission reduction strategies.*" This is an improvement over the egregious language in the GPR. However, the RDEIR revision still does not commit the County to strong, clear, air quality improving action. **Please clarify "as appropriate."** It is hard to imagine a project without air quality impacts. Are the key words here "under the General Plan?" Is the implication that "under the General Plan" it will be "appropriate" to evaluate only certain projects? **Please revise this Policy to enable the reader to understand the meaning and implications of this Policy.** Please change "will" to "shall." What if the project is not consistent with the listed emission reduction strategies? What action will the County take then?

I17-622

**AQ-1.8 Greenhouse Gas Emissions Reduction Plan/Climate Action Plan (RDEIR p. ES-9, etc.):** This new Policy is listed in Table ES-3-Required Additional Mitigating Policies and Implementation Measures. This new Policy states: "The County will develop a Greenhouse Gas Emissions Reduction Plan (Plan) that identifies greenhouse gas emissions within the County as well as ways to reduce those emissions. The Plan will incorporate the requirements adopted by the California Air Resources Board specific to this issue. In addition, the County will work with the Tulare County Association of Governments and other applicable agencies to include the following key items in the regional planning efforts.

I17-623

- Inventory all known, or reasonably discoverable, sources of greenhouse gases in the County
- Inventory the greenhouse gas emissions in the most current year available, and those projected for year 2020, and
- Set a target for the reduction of emissions attributable to the County's discretionary land use decisions and its own internal government operations."

The County issued a **Draft Climate Action Plan (CAP)** along with the GPU documents (GPU/GPR, Background Report, and RDEIR) in March, 2010. **In a paid advertisement on March 25, 2010, when the documents became available to the public, the County announced that:**

**"A Climate Action Plan has been prepared as an implementation measure of the General Plan Update. The Climate Action Plan is not a part of the formal General Plan Update documents but will be considered for approval subsequent to the adoption of the General Plan Update. . . .** In light of the recent legislative actions specific to sustainability and climate change, the County has initiated a Climate Action Strategy specific to its unique rural nature. As an initial step, the County has prepared a

134

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

Greenhouse Gas Inventory for the Planning Area. **The Tulare County Climate Action Plan serves as a guiding document for County actions to reduce greenhouse gas emissions and adapt to the potential effects of climate change. The CAP is an implementation measure of the General Plan 2030 Update. An Implementation Measure is a specific action, program, procedure, or technique. Implementation Measures are provided to help ensure that appropriate actions are taken to implement the General Plan. . . . The General Plan provides the supporting framework for development in the County to produce fewer greenhouse gas emissions during Plan buildout. The CAP builds on the General Plan's framework with more specific actions that will be applied to achieve emission reduction targets consistent with California legislation."**

I17-623  
cont'd

Most of this text is repeated as a frontispiece in the CAP and on page 1 of its Executive Summary. Since global climate change may be the greatest threat facing Tulare County, it is essential that the GPU/RDEIR require clear, timely, definite, enforceable Policies and concrete, measurable, timely Implementation Measures to address it. **Please explain why the CAP, the "guiding document for County actions to reduce greenhouse gas emissions and adapt to the potential effects of climate change" is not being adopted along with the GPU/RDEIR. When is it going to be adopted, so that it can serve as an Implementation Measure for the GPU? When there is no certainty of when or if it will actually be adopted, please explain how it can serve as "Required Additional Mitigating Policies and Implementation Measures?"**

**IM#16 (RDEIR p. ES-9, etc.):** This new IM is listed under "Required Additional Mitigating policies and Implementation Measures in the RDEIR. It states that "The County shall develop and maintain a climate action plan. The climate action plan shall include the following elements: an emissions inventory, emission reduction targets, applicable greenhouse gas control measures, and monitoring and reporting plan." As discussed directly above, **the County has developed a draft climate action plan, but when it will be actually adopted is uncertain.** The draft plan appears to include the elements listed. How it will be maintained is unclear. **CAP p. 84 lists actions that "should be initiated within the first year after the adoption of the CAP."** These include assigning a CAP Coordinator, setting up a Cap Implementation Committee to assign responsibilities, participating with TCAG on SB375 Targets, developing a LEED/LEED ND Implementation Program, obtaining technical assistance, developing a fee/cost recovery program to implement monitoring and reporting, and compiling a first progress report as a part of the Annual General Plan Implementation report. It then jumps to Long-Term Actions, with milestones of approximately every 5 years, including reviewing data, analyzing completed projects, and updating the CAP to reflect changes in State regulations and CAP programs. Every five years seems far too infrequent for updating the CAP to reflect changes in the rapidly-evolving field of State regulations and programs relating to climate change. **Please revise this IM to require the CAP to be updated yearly to maintain currency with these regulations and programs. Additionally, the CAP Implementation provision is a list of actions that "should" be "initiated" within the first year after adoption of the CAP. Please**

I17-624

revise IM#16 to require that at least the majority of the items on this list must be completed within a year of the CAP's adoption.

I17-624  
cont'd

**IM#17 (RDEIR p. ES-9, etc.):** This new IM is listed under "Required Additional Mitigating policies and Implementation Measures in the RDEIR. It is unclear which Policy this IM is related to. Please make this clear.

I17-625

This IM states that the County "may inspect County facilities to evaluate energy use, the effectiveness of water conservation measures, production of GHGs, use of recycled and renewable products and indoor air quality to develop recommendations for performance improvement or mitigation. The County shall update the audit periodically and review progress towards implementation of its recommendations." Please change "may" to "shall." "May" does not implement anything. This IM needs a Timeline. When will the County inspect its facilities for this important evaluation? Has it not carried out any such inspections and evaluations to date? When would the recommendations be developed? Has the County not yet made any such recommendations? If it has made any, has it implemented them? If so, what are the results? As discussed earlier, it is important for the County to provide leadership and a good example in these critical areas. This IM should also require the County to publicize the results of its inspections, recommendations, and progress reviews, so that others could learn from them.

**AQ-1.9 Support Off-Site Measures to Reduce Greenhouse Gas Emissions (RDEIR p. ES-9, etc.):** This new Policy is likewise in Table ES-3- Required Additional Mitigating Policies and Implementation Measures. It says, "The County will support and encourage the use of off-site measures or the purchase of carbon offsets to reduce greenhouse gas emissions." Please define "off-site measures" and "purchase of carbon credits" as they are to be understood in this context. They should be defined and discussed in the GPR and the Background Report, but they are not even mentioned there. Please explain why the County "will support and encourage" these methods and how the County will do so and when the County will do so. Who will pay for the purchase of carbon credits? When Tulare County's air quality is often the worst in the nation and we are already suffering from the impacts of global climate change, why isn't it better for the County to use IMs that will deal directly with reducing GHG emissions here in our County, where we can directly monitor the actual results?

I17-626

## 9.2 Transportation Design (GPR p. 9-8 ff)

I17-627

**AQ-2.2 Indirect Source Review (p. 9-8):** Please define "major development projects" here, so that the reader will know what this Policy applies to (without having to search the web for the information; it is not included in the Background Report either). Please include in the list of mitigations what is perhaps the most important one:

*“Locating, preferably as infill, adjacent to existing development, jobs, infrastructure, schools, and services so as to minimize necessary VMTs.”* | 117-627  
cont'd

**IM#8 (p. 9-12)** is too vague to be measured. What will the County do, and when, to “increase expansion and enhancement of existing public transit services?” **This IM should be revised to indicate, e.g., number of buses to be added per year, number of additional stops to be served on existing routes, new routes to be added, number of park and ride facilities to be added, miles of cycling and walking trails to be completed, etc.** | 117-628

**IM#9 (p. 9-12):** This IM is also far too vague, and its Timeline is “ongoing.” This IM appears to be based on a 2004 Resolution. **Has the County already developed and implemented the outreach program to inform major employers of the Commuter Choice Program? If so, what did the County do? What were the results? If not, this IM needs a definite deadline. How frequently and by what method(s) should the County provide such information to major employers?** | 117-629

**IM#10 (p. 9-12):** This is another “ongoing” IM characterized as a “New” program. **Does the County already have a flextime work hour program for its employees? If so, when did it start, and how many employees are not commuting during peak hours? What factors are to be considered in the evaluation? Is the program successful? This IM should require information about this program and its results to be publicized so that other employers can learn from the County’s experience.** | 117-630

**AQ-2.3 Transportation and Air Quality (p. 9-8) and IMs #8 and #9 (p. 9-12):** Is it correct that all of these alternatives have already been comprehensively studied? If so, what were the results of the studies? If not, which have not yet been comprehensively studied? It’s time for implementation of the obvious alternatives to the degree that we can fund it. If we can’t fund it, the County should be actively seeking funding. The two IMs are discussed directly above; please improve them. | 117-631

**9.3 Land Use/Design (GPR p. 9-9 ff)** | 117-632

**AQ-3.1 Location of Support Services (p. 9-9):** This is a good idea, but the Policy is too vague (“encourage;” how? when?) to be meaningful, and it has no implementation measure. **Recommendation: the County should immediately begin to promote infill development through tiered developer impact fees and/or other incentives (including mitigation fees for non-infill greenfield development) and through strict enforcement of UDBs and HDBs. . Could the County incentivize or require the location of some of these services (e.g., child care, food service, ATMs, small convenience stores) within major employment centers?**

**AQ-3.2 Infill Near Employment (p. 9-9) and IM #11:** Identifying opportunities doesn't make infill happen. **Please strengthen this Policy to state concretely what the County will do to actually, measurably increase infill development and reduce vehicle trips.** | 117-633

**IM#11 (p. 9-12)** states that the County will identify these opportunities by identifying opportunities in community [plan?] updates, hamlet plans, and redevelopment plans over time. The community and hamlet plan processes are extremely lengthy and rare occurrences. **The County should implement tiered developer impact fees and/or other incentives** to cause every applicant for new development to prefer infill as the more cost-effective option, as mentioned in the preceding comment.

**AQ-3.3 Street Design (p. 9-9):** Here is yet another "good idea" Policy that is too vague ("promote"; how? when? What kind of design?); **please clarify and also provide a specific Implementation Measure.** | 117-634

**Recommendation:** This Policy and its IMs should require new development to be based on a small-block traditional grid street system to promote walking and biking and reduce VMTs. Streets should be required to include designated spaces for bus parking for passenger stops, with shelters. Streets should be required to include extensive plantings of native large-canopy drought-tolerant shade trees to clean and cool the air and invite pedestrian traffic. Streets should be required to include bike lanes and traffic calming devices to promote pedestrian and cyclist safety.

**AQ-3.4 Landscape (p. 9-9):** Please change "encourage" to "require" and include some IMs (it currently has none) to prescribe how and when this will be made to happen. **Please include** that the landscaping must be drought tolerant and incorporate a high percentage (over 80%) of native plants. | 117-635

**AQ-3.5 Alternative Energy Design (p. 9-9) and IM #12 (p. 9-12):** Here the County has a Policy to "encourage" implemented by an IM only to "encourage." Mandating energy-efficient and water-efficient design are key methods of reducing GHGs and addressing global warming impacts and complying with AB32 and the County's Climate Action Plan. Yet there is nothing concrete or measurable in this IM, which is identified as "ongoing." PLEASE put meaningful green building requirements in place before the end of this year to begin accomplishing these key objectives. The County could require that a fixed percent (e.g., minimum of 10 or 15%) above Title 24 standards be achieved for energy efficiency. The LEED-ND certification process is now available. | 117-636

**AQ-3.6 Mixed Land Uses (p. 9-9):** This worthy Policy is rendered almost meaningless by "encourage" and no IM. **Please make it and an IM for it clear, concrete, measurable, enforceable, and timely.** | 117-637

**AQ-4.1 Air Pollution Control Technology (p. 9-9) and IM #13 (p. 9-12):** What BACM and RACM measures have been adopted by the County so far? How does the County determine which ones to adopt? What determines whether these measures are "appropriate" to new development? Why would the County not adopt all BACM and

138

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

RACM to address our terrible air quality problems? Why won't these measures be applied to redevelopment as well as new development? The IM says only that the County "*will work with TCAG in refining and maintaining a current set of RACM and BACM that can be used* in reviewing and conditioning transportation and circulation projects" and that implementation of this Policy is Ongoing. Why does the IM deal with only transportation and circulation projects? **Please revise it to cover all development and redevelopment and to require BACM and RACM conditioning of projects.** Given its air quality problems, clearly, **the County must implement much more stringent measures, especially in the face of the tremendous growth and additional VMTs projected under the General Plan**, if it is to meet air quality standards, protect the health of its citizens and its environment, and comply with AB32 and its Climate Action Plan. **Please make this Policy and its IM clear, concrete, comprehensive, mandatory, and effective.**

I17-638  
cont'd

**AQ-4.2 Dust Suppression Measures (p. 9-10) and IM#4 and #5 (p. 9-11):** In the Matrix, p. 215, it was requested that this Policy be changed from requiring "contractors" to requiring "anyone engaged in earth moving" to implement dust suppression measures. The County responded by changing this to "developers," and stating that the County "does actively require contractors and permit holders to implement dust suppression measures in accordance with SJVAPCD standards." We applaud the County's positive activity in this respect and request that this requirement be stated in the Policy. **Please revise it to** "The County shall require *developers, contractors, and all permit holders* to implement . . . ." **We are glad to see that the SJVAPCD standards are being echoed and emphasized here in the GPR.** This emphasis should extend beyond developers to all significant dust-producers, including agriculturists. **Please include a Policy regarding agricultural dust suppression measures** because agricultural operations are major dust-creators in the County.

I17-639

**IM#4 (p. 9-11):** The 2008 version of this IM (#5, p. 9-8 of the 2008 GPR) said that "The County . . . *shall develop* standard methods." The 2010 version says that the County "*shall consider* standard methods." **Please explain why this wording has been changed and clarify the meaning of this IM. Does this mean that the County shall consider developing standard methods, or that the standard methods have now been developed and the County will be applying them? If the County has standard methods of determining and mitigating project air quality impacts and related thresholds of significance, what are they, and where can the public read them? Please include this information in this IM.** The timeline has been changed from 2007-2010 to 2010-2015, which implies that the standard methods have not yet been developed.

I17-640

**AQ-4.3 Paving or Treatment of Roadways for Reduced Air Emissions (p. 9-10) and IM#6 (p. 9-11) and #14 (p. 9-13):** **Please eliminate** "where feasible" in the first sentence; logically, if you can get the equipment in there to create a road, you can get the equipment in to pave or treat the road. **Please clarify** the second sentence, which implies that there could be new projects that will never have to pave their roads. **Please require all new projects to pave their roads and to establish permanent, secured funding for their maintenance.** Unpaved roads are a

I17-641

139

major source of deadly particulate matter pollution (and may also contribute to dispersal of Valley Fever spores). Requiring all roads to be paved could contribute to better air quality, better health, and better visibility (also important to tourism).

117-641  
cont'd

**IM#6 (p. 9-11) deals only with the County's refuse sites, so how does it implement AQ-4.3?** Do these sites' roads fall into the "new roads" category? Why doesn't the County pave these unpaved access roads? When are the periodic reviews conducted, and what have they shown about the effectiveness of this ongoing measure?

117-642

**AQ-4.4 Wood Burning Devices (p. 9-10):** It is heartening to see a Policy in which the County actually "requires" a beneficial action. The second sentence, however, is still only a "promote," which is too vague, and there is no IM. Please change this Policy to "require" natural gas instead of wood products in all new homes which have access to natural gas and add a concrete IM (it currently has none) with a near-term implementation date. How can the County require the use of natural gas instead of wood products in existing homes? Can it require retrofit or replacement upon resale of the home? The County already has a lot of "no burn" days; these are necessary, but the rule is very hard to enforce, especially at the level of individual homes. **Recommendation: the County should disallow wood-burning fireplaces and stoves and space heating devices in any new construction.** We hate to say this, because of the romance and tradition of fireplaces and woodstoves, but fireplaces and woodstoves (even EPA Phase II certified) produce orders of magnitude more particulate matter than well-tuned gas devices producing equivalent heat, and, given the exigencies of the County's air pollution problems, its need to protect the health and welfare of its citizens and its environment, and its need to comply with AB32 and its Climate Action Plan, wood-burning devices probably have to become a thing of the past, unless we can hugely reduce California's population. The more of us there are, the greater our cumulative impact, the more we must restrict our wonted freedoms. The Matrix, p. 216, #12, rejected a previous comment's recommendation to ban fireplaces and woodstoves, stating that the County will comply with State law and SJVAPCD rules. **Since the County is, presumably, already complying with State law and SJVAPCD rules and nevertheless is far too often failing to meet State air quality standards, then, obviously, the County must implement more stringent policies and implementation measures of its own.** Of course, agricultural burning probably contributes more emissions and particulate matter than all the residential burning put together, and agricultural burning is not mentioned here. **Recommendation: a new Policy should be added to prohibit agricultural burning** (unless some defined emergency condition exists). Burnable agricultural waste should be converted to mulch or, where economically and environmentally feasible, used for biofuel.

117-643

**AQ-4.5 Public Awareness (p. 9-10) and IM#1 (p. 9-11):** The Policy is vague ("promote," with no indication of when or how) ; please clarify it. A good place to start walking this talk about promoting public awareness of the seriousness and extent of the existing air quality problems would be right here in the General Plan update, which is not getting anywhere near describing the seriousness and extent of the County's existing pollution

117-644

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

140

problems, in a way that will promote public awareness and understanding, enabling the community to realize and support the fact that the County must take concrete (and not easy) steps to remedy a dire situation that will exacerbate and will be exacerbated by global climate change. Please see discussion of this inadequacy above.

I17-644  
cont'd

IM#1 (p. 9-11) says the County will work with TCAG to develop an “enhanced public information program aimed at reducing trips and improving air quality awareness.” This measure was evidently proposed by Resolution in 2004. It was scheduled for implementation in 2007-2010 in the 2008 version. It is now scheduled for implementation in 2010-2015. This evidences very little determination on the County’s part to educate and influence the public and increase their awareness of these long-term, debilitating, and life-threatening problems affecting the majority of the County’s population. The GPU process offers an excellent opportunity to inform the public and increase awareness, but the County is not publicizing it, and the GPU itself is not well aimed at reducing trips and improving air quality awareness. The GPU documents, as discussed above, are inadequate in promoting awareness of the seriousness and extent of our air quality problems. What is meant in this IM by “an enhanced public information program?”

I17-645

AQ 4.6 Asbestos Airborne Toxic Control and Dust Protection (p. 9-10) and IM#15 (p. 9-13): This is not a Policy at all, but only a very brief description of a problem. Does the County intend to present a Policy related to asbestos?

I17-646

IM#15 (p. 9-13): This IM says that the County will require those who deal with asbestos to follow State law regarding asbestos, with an “ongoing” timeline. It appears that the word “of” should be changed to “or” in “the sale of use of serpentine material.” Since these Codes were adopted in 2001 and 1990 (amended in 2000) and Rule 4002 was adopted in 1991 (last amended in 2004) and Rule 7050 was adopted in 1994 (and last amended in 2002) it is good to see that the County is requiring that they be complied with.

I17-647

NOTE: the 2008 DEIR included as Required Mitigation Measures two new policies:

I17-648

- Policy AQ-4.6 PM10 and PM2.5 Reduction Measures for Dairy and Feedlot Operations (DEIR p. 4-52): “The County shall ensure that dairy and feedlot operators implement the following particulate matter reduction measures as part of all dairy operations [followed by a list of 11 measures].”
- Policy AQ-4.7 ROG Reduction Measures for Dairy and Feedlot Operations (p. DEIR 4-53): “The County shall ensure that dairy operators implement the following ROG reduction measures as part of all dairy operations [followed by a list of 7 measures].”

Why has the County eliminated these important Policies, shown in the 2008 DEIR as required new Policies, from the 2010 GPU documents? Dairies and feedlots are major contributors to air pollution and GHG emissions in Tulare County, and the 2010 documents must address them much more substantially in order to inform the reader of current conditions and trends impacting the county, identify planning issues and challenges that should be

141

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

addressed through the general plan, explore and evaluate the implications of land use and policy alternatives, provide guidance in the planning and evaluation of future land use decisions, and to consider the significant environmental effects and identify ways to minimize them through General Plan Policies. AQ-4.6 and AQ-4.7 dealt with implementing SJVAPCD Fugitive Dust Emission Control Plans and SJVAPCD Rule 4570 ROG reduction requirements, both very important to public health and safety in Tulare County. **Please restore these Policies to the 2010 GPU documents.**

I17-648  
cont'd

As discussed above, improving air quality is a top priority of Tulare County residents; it is essential to public health, is very important to tourism, is a top priority (in terms of GHG emissions) in mitigating global climate change, is required by the Federal and State governments, and is being given a big push by the need to comply with AB32, SB375, and the County's Climate Action Plan. **The County's commitment to meeting these critical air quality goals as evidenced by the Policies and Implementation Measures in the GPR and RDEIR seems half-hearted and lackadaisical.** As mentioned before, CARB and numerous other organizations publish long lists of positive actions that the County could take right away to address its air quality problems, and many counties have already implemented many of them, so we have a wide path to follow. **The County should adopt by resolution and implement through strong, clear policies and implementation measures all applicable CARB mitigation measures (incorporated by reference herein) by the end of 2011. The County should herald its commitment and leadership by joining other counties across the nation in the Cool Counties partnership.**

I17-649

**Consistency Question:** On Matrix p. 218 (top), RMA states, with regard to methyl bromide, that "the County can and has imposed requirements beyond the minimum required by State law." However, in response to a suggestion that the County adopt a Policy to implement agricultural dust suppression measures (Matrix, p. 217), RMA's response was that "the SJVAPCD currently regulates these issues." **Please state and explain what the criteria are for the County to reiterate or even exceed the requirements of State law or SJVAPCD or other agency's regulations.** We would like to see much better control of agricultural dust and burning, to reduce pollution, GHG emissions, and haze, and to mitigate global climate change impacts.

I17-650

**The County should include in the GPR policies limiting agricultural dust and burning, either reiterating the requirements of the applicable law or regulation, or, preferably, imposing requirements beyond the legal or regulatory minimums.** (Why does the GPR address development dust impacts, but not agricultural dust impacts?)

I17-651

## AIR QUALITY – BACKGROUND REPORT (BR):

I17-652

Thank you for correcting the hyperlink information for the source for **Table 6-1 State and National Criteria Air Pollutant Standards, Effects, and Sources (p. 6-6).** The Background Report (p. 6-12, top paragraph) refers to the SJVAPCD's "Air Quality Guidelines for General Plans" (2003 revised in June, 2005. The guidelines (p. 1-1) emphasize that "To obtain full benefit from these adopted goals and policies, cities and *counties must proceed*

142

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

*rapidly with strong implementation programs*” [emphasis added]. “The District’s plans to attain state and federal air quality standards *rely on local government to implement control measures that reduce emissions . . . to reduce vehicle trips and miles traveled, to increase average vehicle ridership, or to reduce direct emissions from vehicle activity . . .*” (p. 1-2). “. . .to persuade San Joaquin Valley residents to drive less . . . *we must change the way we plan, develop, and manage our communities to make it easier and more attractive . . . to use transit, bicycle, or walk.*”

I17-652  
cont'd

Policies that promote compact development and efficient infrastructure minimize infrastructure costs, preserve natural or agricultural lands, and achieve air quality benefits by reducing vehicle trip lengths and improving the potential for transit service (p. 1-8). “*Implementation of the strategies with actual programs is the real key to air quality improvements*” (p. 1-9). Land uses that “are supportive of walking, bicycling, and transit can achieve long range trip reduction of 8 to 10 percent on a regional basis and more than 20 percent on a project basis,” assuming that new development will be served by an efficient transit system. Trip reductions equate roughly to emission reductions” (p. 1-9). The emphasis is on” local actions to reduce vehicle trips, reduce vehicle miles traveled, and increase average vehicle ridership” (p. 1-10).

As illustrated specifically throughout these comments, **the County has too often not responded to the necessity of writing firm, clear policies and concrete, measurable implementation measures with actual programs that will enable the County to make milestone progress on reducing its GHG emissions and improving its air quality.**

**Existing Emission Sources (Background Report p. 6-130):** It is misleading to state only the good news that emission levels in the valley have generally been decreasing overall since 1990 due to motor vehicle emission controls without mentioning the bad news that, due to huge population growth since 1990 (Tulare County has added about 100,000 people since then) and the fact that increase in VMTs is proportionately exceeding increase in population, “**this growth is overwhelming our hard-won progress and may cause overall mobile source emissions to begin increasing early in the next decade.** This is unacceptable considering that the federal Clean Air Act mandates us to reduce emissions of ozone precursors by at least three percent per year until air quality standards are attained. Any slack created by increases in motor vehicle emissions must be made up from job-producing stationary sources, or we will face the consequences of federal actions to reduce emissions” (p. 1-4, SJVAPCD, “Air Quality Guidelines for General Plans”). In addition, AB32 requires us to further reduce emissions.

I17-653

**This information should be included in this section of the Background Report, to provide a better balanced view of this critical issue.**

Likewise, the next paragraph in this section of the BR states that our PM10 emissions decreased between 1975 and 1995 and has been relatively constant since 2000. **The County still exceeds the State standard for these dangerous particulates on an average of about 150 estimated days per year, as should be noted here.** And, since our population is growing so rapidly, more and more people are suffering from the health and economic impacts of our bad air quality.

I17-654

**Air Quality Monitoring and Existing Emission Levels (BR p. 6-13):** This mentions three monitoring stations in Sequoia National Park; it should be revised to note that the Lookout Point station is no longer active. Thank you for removing the information about the Visalia Airport station, since it is not a CARB site, and no data from it are available on the CARB website. | I17-655

**Table 6-2 – Selected Air Quality Monitoring Data (BR p. 6-15):** This Table and its footnotes are still defective and misleading. Please revise them per the comments above in the Overview section, near the top of this comment letter. We cannot locate this table via the datalink information provided in the footnotes. | I17-656

**The Air Quality section of the Background Report is also defective in terms of providing sufficient background information because it does not provide information regarding the significance and consequences of the County's poor air quality. It addresses the health impacts of air quality in only the most cursory way** (in Table 6-1 on pp. 6-6 – 6-7), saying nothing about the County's high asthma rates, its high hospitalization rates, its exceedance of the State PM10 standards on an estimated half the days of the year, its typically well over a 100 days per year (210 days in 2007) when its ozone pollution makes breathing its air unhealthy for sensitive groups (a very large percentage of the population – the young, the old, those with heart and lung problems – well over 50% of Tulare County's population). (Thank you for adding a section on Climate Change, which was never even mentioned in the 2008 Background Report.) It doesn't address the **economic costs (beyond mentioning health care and emergencies) of our poor air quality, including crop damage and losses.** It never talks about WHY we have all these organizations and regulations trying to deal with Air Quality: it has a gigantic impact on our quality of life (including shortening our lives, limiting our activities, impacting children especially – in some cases keeping their lungs from ever fully developing) and if we don't substantially reduce our GHG emissions starting right away, we will face ever more serious impacts from global climate change, impacts that are already occurring..  
**The Background Report must disclose these facts as well, because it currently gives only a small part of the picture and doesn't give the reader a good understanding of the significance of the issue and a means to analyze what should be done in response to it.** | I17-657

**The Air Quality section of the BR (pp. 6-18 – 6-19) describes three County Resolutions** adopted in 2002 and 2004 in response to legislative requirements and designations. It does not state whether RACMs adopted were actually carried out and what effect they had on the air quality problem. (See more detailed discussion of the first two above.) Many of the RACMs are so vague that they cannot be measured or enforced. Several of them (e.g., "supporting," "exploring concepts of Livable Communities," "consideration of incentives") appear to have advanced little beyond the stage of being adopted, as they now are written just as vaguely as Implementation Measures in the current GPR. | I17-658

**The Background Report should not simply describe these Resolutions, but should analyze their effectiveness in terms of the results they have achieved, to enable the reader to better evaluate the likely effectiveness and timeliness of the mitigation measures described in the RDEIR.**

I17-658  
cont'd

**Recirculated Draft Environmental Impact Report (RDEIR) Section 3.3 Air Quality (p. 3.3-1 ff):**

I17-659

**The RDEIR is deficient, like the Goals and Policies Report and the Background Report, because it does not adequately disclose, describe, and evaluate the effects of the County's air quality problems on the physical and economic health of the County, nor does it adequately disclose, describe, and evaluate the reasonably foreseeable effects of the build-out of the GP update in this area.**

**It does not provide the public and decision-makers with sufficient facts and clear analysis to confidently determine that the necessary relevant issues and their impacts have been covered. The comments above on the inadequacies of the Background Report apply to the RDEIR as well and are incorporated here by reference. (Much of the information in the RDEIR duplicates the related text in the Background Report.) The RDEIR Air Quality section, however, does include some material not contained in the related Background Report section. For example, on p. 3.3-5 it discusses Asbestos, and on p. 3.3-6 it discusses Valley Fever. As is typical, neither of these topics is related in any way to human or environmental health impacts. Thus, there is no indication in the Valley Fever section of why this is of interest (Valley Fever can kill people), how many people are infected by it in Tulare County, how it affects them, how many die, etc. Not just winds, but construction and agriculture can disperse the spores. In California in 2000-2007, 16,970 cases of Valley Fever were reported, with 752 deaths (the highest incidence being in the San Joaquin Valley). Animals other than humans can also contract Valley Fever.**

I17-660

**Methodology (p. 3.3-16):**

**The first sentence states that the GP Update "will allow planned development to occur within both developed and undeveloped portions of the County," and that the "buildout will ultimately be market driven." The GP update will not only allow development to occur in undeveloped portions of the County, the update currently promotes such development by providing for new towns and new growth corridors in greenfield areas. To achieve its Goals and respect and respond to the priorities of its citizens, the County must ensure that the General Plan directs all new growth to the degree that it possibly can to ONLY the already-developed portions of the County. That mandate, and requiring greater average densities, better transportation alternatives, and increasing Multi-Use and walkable development, is the only alternative that will enable the County to meaningfully mitigate air quality and GHG emission impacts while best achieving all its other Goals..**

I17-661

Market-driven development has produced the sprawling, resource-intensive, automobile-driven, highly polluting developed environment that we are living in today. This type of development cannot be sustained in Tulare County. It is also misleading to term it simply “market-driven,” in that those who profit from the market also drive the market through intense advertising and a reluctance to change. In order to meet the challenges of global climate change and to provide for a sustainable future, we must shift the paradigm, and responsible, **healthy growth policy must drive the market**, steering it in the right direction until that becomes the norm. We already have more than enough inefficient development. Now the General Plan must require development to be as resource-efficient as possible. The **DEIR must present a Healthy Growth Project Alternative to address this need.**

I17-662

The first paragraph under Methodology (p. 3.3-16) states an assumption of a year 2030 buildout, but the seventh paragraph (p. 3.3-17) says that the dairy and feedlot associated emissions model assumes buildout by year 2020. Please state how these are to be reconciled. Please include a discussion of dairy and feedlot associated emissions in the Air Quality section of the RDEIR, including their significance and how they are being addressed.

I17-663

Criteria Pollutants (RDEIR p. 3.3-15) footnote 1 at bottom of page: please include in this footnote the applicable definition of “very large” and “very intense” construction projects, without which the footnote means very little.

I17-664

**AQ Impacts and Mitigation Measures (RDEIR p. 3.3-18 ff)**

I17-665

**Impact 3.3-1 “The GP Update would result in a cumulatively considerable net increase of criteria air pollutants that result in a violation of an air quality standard (p. 3.3-18 ff):** In the 2008 DEIR, (p.4-49, Impact AQ-1), this impact was stated differently: “The GPU would result in a cumulatively considerable net increase of air pollutants. Future growth in accordance with the GPU would exceed the SJVAPCD thresholds for ROG and PM-10.”

**AQ-1 Impact Summary (DEIR p. 4-49):** Incredibly, the Level of Significance Before Mitigation is rated as “Potentially Significant.” Given that ALREADY the County’s air quality is rated the worst or near the worst in the nation, and this is BEFORE we add the proposed 200,000 additional people and their vehicles and their energy consumption and the additional confined animal facilities, and all the new construction, and global warming impacts, it is inevitable, unless drastic and immediate changes are made, that under the GP update buildout our air quality and GHG emissions will only become much worse. Therefore, please change this rating to “*Without a Doubt Extremely Significant*” or whatever the appropriate rating is for that dire condition. Please change the Level of Significance After Mitigation to “*Extremely Significant*” also. The DEIR provides no basis for evaluation and

I17-666

comparison of our baseline air quality situation, the situation as projected without mitigation, and the situation as projected with mitigation, leaving the reader to rely on common sense.

I17-666  
cont'd

**Impact 3.3-1 Construction ( RDEIR p. 3.3-18):** Please revise the first sentence to make it more accurate: Change from “Construction activity that would occur over the next several years . . . would cause temporary, short-term emissions . . . within all of the County’s individual planning areas . . . “ to “Construction activity that would occur over the next twenty years . . . would cause *emissions on at least five days per week every week during typically at least an eight hour period on each of those days of various air pollutants . . .*” Given that the County projects a population increase of well over 200,000 during the GP period, it is obvious that construction activity will be ongoing and widespread, causing much more than temporary, short-term emissions.

I17-667

**Impact 3.3-2 Operational Impacts (RDEIR, p. 3.3-20):** The first sentence states that **operational impacts would primarily result from mobile source emissions, dairy and feedlot operational emissions, and natural gas combustion for stationary sources.** Two new Policies (AQ-4.6 and AQ-4.7 in the 2008 DEIR p. 4-52 ff) were declared in the 2008 DEIR to be required to address the dairy and feedlot operations; these dairy/feedlot(confined animal facilities) pollution issues have become so extreme that concerned citizens groups have had to sue the County about them. However, these two new Policies have been REMOVED in the 2010 RDEIR. Please explain why the RDEIR does not include these Policies and how it is addressing this critical source of operational emissions. Additionally, this RDEIR AQ section does not address vehicle emissions (mobile source emissions)even though they are the chief source of much of our air pollution and GHG. **Here is where strong, clear new Policies and Implementation Measures requiring compact, denser, resource-efficient, transit-oriented, walkable development located where jobs, services, and infrastructure already exist should come in. The AQ Mitigation Measures are deficient because they do not strongly and specifically address vehicle emissions.**

I17-668

**Impact 3.3-2 Table 3.3-5 Tulare County Operational Emissions (RDEIR pp. 3.3-20 and 3.3-21)**  
This Table shows changes in estimated tons per year of various operational emissions between existing year (2007) and buildout year (2030). **Please include the necessary corresponding information regarding existing impacts on human and environmental health, economic impacts, and global warming impacts, and then project these impacts based on the emissions increases (and decreases) shown (e.g., increase in asthma rates and other respiratory diseases, increase in number of days when exercising outdoors would be harmful, increase in health care costs, increase in crop losses, increase in number of days over 100, decrease in snowpack, etc.); this information could be presented in a Table also. It would need to be based on existing population and buildout population.**

I17-669

**The figures in Table 3.3-5 (RDEIR p. 3.3-20) have been substantially changed** from the corresponding figures in the 2008 DEIR (Table 4-2, 2008 DEIR pp. 4-50 – 4-51). **Please explain these differences and why the changes**

I17-670

147

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

were made. The 2008 table shows "Tulare County Onroad Vehicle Emissions" and shows, for example, *ROG figures of 1270 tons per year existing, 652 tons/year at buildout*. The 2010 Table shows "Tulare County Mobile Source Emissions" of ROG of *911 tons/year existing and 731tons/year at buildout*. **All the figures are different in this section of the table.**

I17-670  
cont'd

The second part of the table is "Tulare County Dairy and Feedlot Emissions." The figures are the same from ROG through PM2.5. However, **the 2008 table showed Methane and Ammonia Emissions in Tons/Year (the figures are huge). Why has this important information been eliminated from Table 3.3-5?** Methane and ammonia are significant to air quality, and dairies and feedlots emit 63% of the GHG in unincorporated Tulare County, per the Climate Action Plan. (This information is not covered in the Energy and Global Climate Change section of the RDEIR either.) **Please restore this important information to Table 3.3-5 and discuss the significance of these impacts and how they will be mitigated in this section of the RDEIR.**

I17-671

It should be noted, for example, that p. 3.3-21, in its discussion of SJVAPCD Rules and Regulations lists **Rule 4570 Confined Animal Facilities**, but does not note that this Rule applies only to very large operations (e.g., over 1,000 milking cows [dairies], over 3500 beef cattle [feedlots], over 7500 calves/heifers, over 650,000chickens, etc.). **The RDEIR and the Background Report should inform the reader of how many dairy and feedlot operations exist in Tulare County already, how many more are currently pending, the size range of the operations, and the total number of animals involved. Many of the other SJVAPCD Rules and Regulations also include similar thresholds, which should be discussed in the GPU documents and then related to the range of operations typical of Tulare County.**

I17-672

**The RDEIR states on p. 3.3-21 that the "proposed project was designed specifically to address a variety of air quality issues including the need to reduce vehicle and other operational-related air quality emissions." "Additional policies call for a variety of strategies designed to improve air quality through land use planning." "This page lists a number of SJVAPCD Rules and Regulations and GPU policies, but then concludes that, "However, even with implementation of the below mentioned policies and implementation measures, this impact is considered potentially significant."**

I17-673

**On page 3.3-22, the RDEIR lists the Mitigating Policies and Implementation Measures for the Air Quality Element. Virtually every one of these listed Policies (and their Implementation Measures, when they have them) are discussed above as they occur in the GPR. Please refer to the above comments and incorporate them by reference here. The comments show that, almost universally, these Policies and Implementation Measures are far too vague, weak, unmeasurable, unenforceable, laggard, or otherwise unreliable to serve as mitigation and implementation measures for the impacts listed in the RDEIR.**

I17-674

Beginning on p. 3.3-22, the RDEIR then lists a number of other things that “would help to further reduce emissions.” It does not say whether or how the County is implementing these measures through the policies and implementation measures in the GPU/RDEIR. The listing consists primarily of a repetition of the SJVAPCD Rules and Regulations listed on p. 3.3-21, and reiterates that “the County will continue to ensure that a variety of . . . measures” [unspecified] will be “implemented under all future development projects” “through project specific CEQA mitigation measures and permit conditions.” It then concludes that “no additional technologically or economically feasible mitigation measures are currently available,” so the impact remains significant and unavoidable (p. 3.3-23). I17-675

Clearly, however, the County has not made a good faith effort to apply through the policies and implementation measures in the GPU and the RDEIR many of the technologically and economically feasible mitigation measures which are available to it, such as locating new growth and development within existing development boundaries, without loopholes or exceptions that allow for “leapfrog” new town or corridor development; requiring (or incentivizing) resource-efficient development; firmly limiting the circumstances under which development boundaries can be expanded; strongly discouraging the conversion of agricultural and open space lands to urban uses, and offsetting unavoidable impacts with mandatory mitigation measures such as conservation and agricultural easements; increasing average density requirements; and providing strong, clear policies with concrete, enforceable implementation measures that include definite timeframes, funding sources, and departments in charge of monitoring and enforcement. I17-676

Throughout the GPU/RDEIR documents, this pattern repeats. The regulatory setting lists the regulations that apply, there is a description of the environmental setting/conditions in the County, the potential impacts are described, feasible mitigation (General Plan policies) measures are listed, additional measures may be listed, and the resulting and remaining environmental impacts are shown to be less than significant or significant and unavoidable. Yet far too often, as illustrated above, the descriptions are incomplete, questionably accurate, confusing, truncated, or misleading. It is often not clear how the information presented relates to the County or to the goals, policies, and implementation measures of the GPU/RDEIR (or, conversely, how the goals, policies, and implementation measures relate to the information presented). Rarely is it clear how to discern and consider the relative costs and benefits of the proposed project and its environmental impacts. I17-677

Too often, the baseline conditions are not made clear and relevant (e.g., current air quality pollutant emissions should be connected to a corresponding baseline condition of human health impacts and related costs), and the long-term impacts are likewise not made clear and relevant. I17-678

Furthermore, reasonably foreseeable indirect effects are not addressed and made relevant (e.g., the growth-inducing effects of New Towns, leading to even greater population pressures, substantially increased VMTs, increased GHGs and ever-greater air quality impacts). I17-679

The GPU/RDEIR does not clearly present, illustrate, and analyze the extent to which the proposed project will commit non-renewable resources such as high quality agricultural lands, scenic landscapes, almost I17-680

149

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

vanished wetlands and riparian areas to urban uses that future generations will probably be unable to reverse. | I17-680  
cont'd

The GPU/RDEIR never discusses how accumulating GHGs linger in the atmosphere long after they are emitted, continuing to produce and magnify the climate changes that are already adversely impacting Tulare County. The severity of future global warming impacts is our choice: the longer it takes us to reduce GHG emissions, the worse the changes will be; the direct or indirect emission of GHGs is an irreversible effect. | I17-681

The GPU/RDEIR also fails to fully describe and analyze the cumulative impacts of the project. Nowhere, for example, does it discuss how permitting a first New Town in Tulare County, which, when taken in isolation, might seem to some to have manageable environmental impacts, could lead to the development of more New Towns (who knows where?), which could cause multiplying cumulative impacts at great cost to the health of Tulare County's environment and its people. Nowhere does it compare and analyze the environmental (not to mention economic) costs and benefits of developing New Towns and new highway growth corridors versus the costs and benefits of directing new growth into existing urbanized areas and requiring it to be much more resource-efficient, compact, dense, walkable, "green," and transit-oriented. | I17-682

The RDEIR (p. ES-5) is an "informational document." It has two primary purposes (p. 1-4): to assist in the analysis of environmental impacts "by including a *complete and comprehensive evaluation* of the physical impacts of the project and its alternatives" and to "*inform interested stakeholders of the environmental impacts.*" In both of these respects, the RDEIR is inadequate and does not meet CEQA requirements. | I17-683

Table 3.3-5 footnote "b" (RDEIR p. 3.3-21: These emission factors "assume a cleaner mix of vehicles as older, more polluting vehicles are retired" and thus "calculated reductions in future year emissions." However, given that VMTs are expected to increase at a much greater rate than population increase, the increased VMTs are predicted to wipe out the gains made by lower emissions per vehicle. Additionally, the unincorporated County includes a much higher than average percentage of diesel vehicles, many of which are older models and highly polluting. These vehicles typically are operated for many more years than the average car, and so it will take much longer for this population to be retired and replaced by vehicles that will contribute to "a cleaner mix." | I17-684

This begins the AQ add-in fm L  
The policies that would minimize the cumulatively considerable net increase of air pollutants described in the RDEIR are discussed in more detail above, individually and in general. Please incorporate those comments by reference in this section. As written, these policies and their implementation measures are likely to do very little to minimize this impact, as they consist mostly of policies too vague to be meaningful ("support," "promote," "encourage," "study," "consider"). Many of them have no implementation measures at all. The implementation measures that exist are generally not concrete or measurable, and are often "ongoing." | I17-685

Given our air quality problems, the increasing impacts of global warming (which will very likely worsen air quality), and the necessity to comply with AB32, SB375, and the County's Climate Action Plan, **these policies and their implementation measures will not suffice to mitigate this impact, and they must be clarified, strengthened, and made measurably enforceable and effective.** Most of these policies' implementation measures are stated to be "ongoing" and our air quality is terrible. | I17-686

For example, for Impact 3.3-2 – The proposed project would result in a cumulatively considerable net increase of criteria air pollutants that result in a violation of an air quality standard (RDEIR p. 3.3-20). The RDEIR lists over 30 policies in the GPR that would minimize the impact, and states that even with their implementation, the impact is considered "potentially" significant. Please see our specific comments on these policies and their implementation measures above in this document and incorporate them by reference in this section. Again, **almost all of these policies and their implementation measures (where there are any) are vague and weak; they must be clarified and strengthened so as to be enforceable and produce measurable results that will produce mitigation.** As written, they cannot serve as effective mitigating policies and implementation measures for the GPU/RDEIR. Even with their implementation, this impact must certainly be considered *indisputably significant.*" This comment regarding "cannot serve" applies, unfortunately, throughout the GPU/RDEIR. | I17-687

**Impact 3.3-4 Analysis (RDEIR p. 3.3-25):** This analysis raises additional concerns (over and above those noted above) because not only will the GPU produce a huge increase in VMTs and traffic on existing County roads, but it is urging extensive new development areas directly beside highway corridors, where emissions of Toxic Air Contaminants (TACs) such as diesel particulate matter are concentrated, thereby promoting exposure of residents and visitors to these TACs. People working in the businesses to be located next to the highways will be chronically exposed to DPM, risking carcinogenic and non-carcinogenic health effects. Recent studies show greater health risks for people within a mile of heavily traveled roads.  
**Recommendation:** The County should limit new development to within existing development boundaries and should not implement highway growth corridors. | I17-688

**Impact 3.3-5 Objectionable Odors (RDEIR pp. 3.3-27 ff):** For policies cited in this section, please see our detailed comments above on these policies and their implementation measures in the GPR, incorporated by reference to this section. Please incorporate by reference herein our comments already made on AQ-4.7 and AQ-4.8. | I17-689

**The Odor Management Plan** that was mentioned in the 2008 DEIR (p. 4-64) does not appear in the 2010 GPR and is no longer mentioned in the RDEIR. Please discuss this important Plan in the RDEIR and explain how and when it will be implemented. The RDEIR states on p. 3.3-28 that its referenced policies and regulations apply | I17-690

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

only to *new or expanded* dairy or feedlot operations. There are already well over 350 existing dairies and feedlots in the County, and many of them are very near the places into which the GPU appears to be considering directing growth and development. **Please explain how odor will be required to be managed on these *existing* operations.** This policy singles out dairy and feedlot operations. **Please explain how odor will be required to be managed on other confined animal facilities in the County.** **Please state whether there is a *size threshold* for the confined animal facilities to which these policies and regulations would apply.** If so, state the threshold and **document how well it would cover existing and proposed confined animal facilities in the County.**

I17-690  
cont'd

Approximately how many County residents currently live within odoriferous range of these facilities? Under the GPU, considering growth in both livestock and human population, approximately how many County residents will be impacted? This section of the DEIR should **explain how odor impacts are currently measured and then describe how the proposed mitigation measures will affect those impacts.** For example, if one measure of adverse odor impacts is the number of complaints received per year, how much would these be likely to be reduced by implementation of this policy?

I17-691

**Impact 3.4-3 (RDEIR p. 3.4-31 ff):** AB32 was enacted in 2006, requiring California to reduce its levels of GHG emissions to 1990 levels by 2020. To do its part in meeting this urgently important requirement, **Tulare County should commit to reducing its GHG emission levels to 1990 levels by 2020.** The County has done little in its GPU/RDEIR documents to uncover, analyze, and fully disclose the reasonably foreseeable effects on the environment of the GPU project.

I17-692

The RDEIR contains some statistical tables, such as Table 3.3-5 on RDEIR p. 3.3-20, but they are incomplete, covering only mobile onroad vehicle emissions and dairy and feedlot emissions. **They must be expanded to include current and projected data for offroad mobile vehicles and for the multitude of stationary sources beyond dairies and feedlots (e.g., industrial, residential, landfills, other agricultural, etc.).**

I17-693

**NOTE:** The text above Table 3.3-5 discusses *offroad* vehicle emissions and says that the increase was calculated **based on the projected 11% job growth rate** in unincorporated Tulare County. The 2008 version of this Table (Table 4-2, DEIR p. 4-50) labels the first emissions source as "Tulare County *Onroad* Vehicle Emissions" and says in the text above that **operational impacts would primarily result from "vehicle emissions generated by future population growth"** and dairy and feedlot development associated with buildout of the GPU. Both the 2008 Table and the 2010 Table reference the same source in footnote "a," but the 2010 version adds information about offroad emissions.

I17-694

The 2010 Table also **omits the CO2 emission information** provided in the 2008 version. It **substantially reduces the figures for the remaining emissions** in the Mobile Source category. It keeps the same figures for the Dairy and Feedlot emissions as were in the 2008 Table, EXCEPT that it **totally omits the categories of Methane and Ammonia and omits their huge corresponding tonnage information** (2008 DEIR p. 4-51). So, what's going on here? **How does this kind of information presentation fulfill the RDEIR's responsibility to inform the public**

I17-695

152

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

and decision-makers? (Please see other comments elsewhere in this letter re Table 3.3-5, and **please revise this Table to make it accurate and complete with a corresponding relevant and accurate textual explanation.**) | I17-695 cont'd

The DEIR should discuss and analyze what the projected emissions increases will mean to quality of life, health, and the economy in Tulare County. The RDEIR **has failed to comply with AB32** because it has failed to prepare a GHG Emissions Reduction Plan as part of the GP update (unless we count the new Climate Action Plan, which is announced as NOT being part of the GPU/RDEIR and not up for adoption with the GPU/RDEIR) and **it has failed to adopt all feasible measures to mitigate the adverse impacts of the GP update.** The mitigation measures presented in the RDEIR to mitigate air impacts include measures already required by the SJVAPCD (e.g., SJVAPCD Rule 4570 regarding confined animal facilities). The RDEIR never notes that these regulations apply only to very large facilities, nor does it note any of the specific requirements of the SJVAPCD rules, nor does it note the new policies associated with dairy and feedlot operations required as additional mitigation measures by the 2008 DEIR (AQ-4.6 and AQ-4.7, p. 4-52 and 4-53, which have vanished). | I17-696

Far too many of the County's policies addressing air quality are vague and unenforceable ("encourage," "support," "consider") and their implementation measures are too often absent or else not concrete or measurable, as discussed in detail above. **We urge the County to expeditiously develop and implement a strong plan to reduce its GHG emissions; time is of the essence.**  
**This ends the AQ add-in fm L** | I17-697

## 10. HEALTH AND SAFETY (GPR p. 10-1 ff, etc.) | I17-698

**p. 10-1: It is thrilling to see "Healthy Communities" added as a new section (Section 10.9) in the Health and Safety Element.** For far too long, health and safety have been neglected in too many of the unincorporated urban and urbanizing areas. |

**Existing Conditions (p. 10-2):** The introduction to this Element should note under **Existing Conditions** that **air quality and water quality are also sources of significant health concerns in Tulare County** and that these are addressed in Element 9 – Air Quality and Element 11 – Water Resources. | I17-699

**p. 10-3, 2<sup>nd</sup> paragraph** in discussion of flooding: This paragraph should **include the information** that in 1998 Earlimart was flooded and Highway 99 was closed; it should also state that the flooding that occurred in 2006 in Cutler-Orosi, which the Governor declared an extreme emergency, was due to levee failures. | I17-700

**p. 10-3, 3<sup>rd</sup> paragraph:** This paragraph should **include the following information** from the Background Report (BR pp. 8-20 – 8-21): **Vegetation fires comprise the majority of fires in Tulare County; most are caused by** | I17-701

153

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

**human activities involving motor vehicles and equipment operation, smoking, arson, and debris burning.**

Communities are increasingly concerned about wildfire safety as increased development occurs in the foothills and mountain areas, and subsequent fire control measures have affected the natural cycle of the ecosystem. Wind, steepness of terrain, and naturally volatile understory create the potential for larger and more intense wildland fires. The threat of wildland fires increases as the terrain becomes increasingly steep in the foothills and mountains. The portion of the county that transitions from the valley floor into the foothills and mountains is characterized by high to very high threat of wildland fires

I17-701  
cont'd

**The creation of residential parcels in these areas has compounded the potential for property damage from fires and has significantly complicated firefighting responsibilities in the area.** Foothill and mountain subdivisions have also virtually eliminated prescribed burning as a means of fire suppression. Conditions of the County's 16 fire stations range 'from excellent to poor,' with many identified as inadequate for housing fire equipment, and response times have increased due to rapid growth without a correspondent growth in fire protection facilities and staffing. **Therefore, as the County continues to grow, the risks of injury, loss of life, and property damage will also increase.** Lack of funding is the main obstacle to improving fire protection. Please implement developer impact and mitigation fees ASAP; here's another example of why they're so much needed. The

I17-702

**Background Report should also discuss what the County spends on fighting fires in the foothill and mountain areas and the environmental impacts of increasing wildfire through development at the wildland-urban interface. The County certainly should not promote development in these fragile areas that are so important to its airshed, watershed, and viewshed, its tourist industry, its recreational opportunities, its open space, its habitat, and its global climate change mitigation strategies – and so much more costly to service, protect, and maintain.**

I17-703

**IM#11 (p. 10-19) mentions detailed information on the County-maintained fire hazard severity map. This map and the detailed information should be included in the GPU/RDEIR. (The Wildland Fire Threat map – Figure 3.8-2, RDEIR p. 3.8-31 – is a start, but it does not even designate the communities and MSCs and hamlets in the High and Very High Fire Threat Areas.)**

I17-704

**HS-1.3 Hazardous Lands (p. 10-3): Please clarify and explain:** should this Hazardous Lands designation apply to all riparian areas and the areas subject to flooding from levee failures, such as Levee Districts I and II on the St. Johns River? **Please provide a map in this section showing where these areas have been designated and how they are zoned.**

I17-705

**Figure 10-1 Seismic/Geologic Hazards and Microzone (p. 10-5): This map is dated 1974, so it does not provide current information. It is basically unreadable at this scale. Please include text discussing where the hazards and microzones are and how County planning and land use are affected by them.**

I17-706

**HS-1.12 Addressing (p. 10-4):** This important safety policy is too vague to be meaningful (how will the County “seek to expand” this Ordinance?) and its Implementation Measure (IM #7, p. 10-18) is too far in the future (2015-2020; was 2010-2015 in the 2008 version). **Please modify this Policy and IM accordingly.** | 117-707

**HS-2.3 Hillside Development (p. 10-7):** This is a good new policy, important for soil conservation, aesthetics, safety, habitat, and lessening runoff and erosion. **Please change “discourage” to “prohibit” and add an Implementation Measure** so that this Policy will be enforceable. | 117-708

**HS-2.6 Seismic Standards for Dams (p. 10-7):** **Please clarify this Policy;** “shall continue to address” is too vague to be meaningful. **Please provide an Implementation Measure** for this Policy to make it measurable and enforceable. The Background Report (pp. 8-17) states that **two major dams and many smaller dams throughout the county would cause flooding in the event of their failing. “However, a comprehensive analysis of the potential for dam failure and possible downstream effects for these upstream dams has not been undertaken.” Please add a clear Policy and concrete Implementation Measure to address this critical issue.** Please make the Policy and IM effective in time to ensure that such a comprehensive analysis will be required prior to the approval of any new dam construction in the County (such as the one proposed to be built at the proposed Yokohl Ranch development). | 117-709

**HS-4.1 Hazardous Materials (p. 10-8):** **Please clarify this Policy;** “strive to ensure” does not indicate who, what, when, where, or how. The Background Report states (BR p. 8-37 – 8-38) that **Tulare County has no facilities authorized to store or dispose of hazardous waste, but that over 7100 tons of hazardous waste was generated in the County in 2008 (versus 1600 tons of hazardous waste originated in the County in 2002, per the 2008 Background Report) and were transported, mainly on State Routes 43, 63, 65, 99, 198, and 201 (BR p. 8-39). It states that the County has over 200 sites that are listed by the SWSRCB as contaminated, almost 150 active cases of leaking underground storage tanks (p. 8-39) and five sites on the federal National Priorities List (in 1988), nine sites on the California Department of Substances Control Hazardous Waste and Substances Site List in 2008 (BR p. 8-41), and two Superfund sites (p. 8-42). Given this level of hazardous waste, please move up the date of the Implementation Measure (#12 on p. 10-20) for this Policy; it was given as 2015-2030 in 2008 and is now listed as 2020-2030 --much too far in the future to begin addressing this problem, which is contaminating our air, water, and soil.** | 117-710

**HS-4.2 Establishment of Procedures to Transport Hazardous Wastes (p. 10-8):** **Please clarify this vague Policy** (if the County shall “continue” to cooperate with CHP on establishing procedures, how can the corresponding IM have a timeline that was starting in 2015 and has now been changed to start in 2020?), and **please move up the timeline for the Implementation Measure** for this Policy (**IM #12, p. 10-20**); 2020-2030 is too far in the future to address this hazardous activity (especially as traffic volumes and congestion constantly increase). | 117-711

<p><b>HS-4.3 Incompatible Land Uses (p. 10-8-4):</b> Please provide earlier dates for beginning work on the Implementation Measures (#12 and #13, p. 10-20) for these important Policies; 2015-2030 has been changed to 2020-2030 -- much too far in the future, especially given the County's very rapid population growth and rapidly increasing areas of development.</p>	I17-712
<p><b>HS-4.4 Contamination Prevention (p. 10-8):</b> Please clarify this very vague Policy and give it an Implementation Measure; explain how reviewing the proposals will ensure protection from contamination. Please include GHG emissions specifically as a contaminant.</p>	I17-713
<p><b>HS-4.5 Increase Public Awareness (p. 10-8):</b> Please clarify this very vague Policy ("work to educate") and give it an Implementation Measure.</p>	I17-714
<p><b>HS-4.6 Pesticide Control (p. 10-8)</b> It was suggested in the Matrix (p. 222) with regard to this Policy that, for the health and safety of its citizens and of its soil, air, water, and wildlife, the County require the use of natural methods of pest control and IPM practices to reduce the use of toxic and long-lived pesticides wherever possible. RMA responded that it would be illegal for the County to ban the use of pesticides, per Section 11501.1 of the Food and Agricultural Code. Having researched this, we see that the County cannot regulate the use of pesticides in general in the County; however, the County is allowed to pass an ordinance that regulates or restricts pesticide use in its own operations.</p> <p>Therefore, please add to Policy HS-4.6: "The County shall require the use of natural methods of pest control and IPM practices to avoid or reduce the use of toxic and/or long-lived pesticides wherever possible in its own operations. Also, please add an Implementation Measure for HS-4.6 to clarify who will require mitigation of effects and what such mitigation will be and when this will be implemented; please make this a concrete and measurable implementation measure. It should be noted that many of the County's contaminated sites are associated with pesticide manufacturing/processing (BR p. 8-41).</p>	I17-715
<p>The RDEIR (p. 3.8-15) lists policies that will minimize hazardous materials impacts. Five of these have no Implementation Measures at all; four of them have Implementation Measures scheduled to be worked on sometime between 2020-2030. They are discussed in more detail above. The GPR's first Value Statement is that the County will protect and enhance the beauty of the County and the health and safety of its residents. Please revise the above Policies and Implementation Measures so that they march to that tune.</p>	I17-716
<p>In 2008, the DEIR (p. 4-79) states that the County's "lack of designated routes for hazardous materials transportation could expose County residents to unnecessary risk" and that "if development is proposed for known hazardous materials sites an extra layer of analysis is required for the safety of people and the</p>	I17-717

environment.” It stated that two new policies, HS-4.8 “Designated Routes for Hazardous Materials Transport” and HS-4.9 “Hazardous Materials Studies” are required.

I17-717  
cont'd

HS-4.8 stated, “The County shall continue to encourage the transportation of hazardous materials within the County to routes that have been designated for such transport.” However, the Background Report states (p. 8-39) that “There are no designated routes within Tulare County for the transportation of inhalation hazards . . . or radioactive materials” per two sections of the Vehicle Code, although apparently it has routes for some materials. We asked that new Policy be strengthened and clarified. Instead, it has simply been eliminated from the 2010 RDEIR. Has the County now designated the appropriate routes, or is this another of the measures being put off until 2020 or 2030? Please explain why this important safety issue is not being addressed.

I17-718

The 2010 RDEIR contains only the second of the two “REQUIRED Additional Mitigating Policies and Implementation Measures,” now numbered HS-4.9 (Hazardous Materials Studies, RDEIR, p. ES-9, etc.). Please change “will” to “shall” in the second sentence of this Policy. The Policy states that “recommendations required to satisfy federal or State cleanup standards outlined in the studies will be implemented as part of the construction phase for each project.” Please explain why the cleanup is not required to be completed to the satisfaction of the standards PRIOR to construction. It seems that construction could further disturb and disperse hazardous materials. What if it turns out that cleanup will take years, as has been the case with many sites? Please require that cleanup must be completed to standards as a condition of permitting the construction phase to begin.

I17-719

10.5 Flood Hazards (p. 10-8) HS-5 “To minimize the possibility for loss of life, injury, or damage to property as a result of flood hazards”:

I17-720

The Flood Hazards section discusses floodplains and dams, but it does not specifically address the flood hazards associated with Tulare County’s Levee Districts’ unmaintained levees and channels. According to the 2005-06 County Grand Jury report and the response of the Board of Supervisors (sitting as the Tulare County Flood Control District Board), the Board of Supervisors has not transferred general fund monies to the TCFCD for channel clearing since the winter of 1997-98, renewal of liability insurance held by District I was denied due to the age and condition of the levee, the Corps of Engineers will not certify the levees within the two levee districts, the levees are not constructed to FEMA standards, and the Board of Supervisors will not fund the TCFCD for regular inspection and maintenance because it is not feasible under the County’s current fiscal circumstances. In 2006, the Governor of California declared the flooding in Cutler-Orosi due to a levee failure an extreme emergency. The Background Report states (p. 8-14) that “The flood carrying capacity in rivers and streams has decreased as trees, vegetation, and structures . . . have increased along the Kaweah, Kings, and Tule Rivers. . . . Confined floodplains can result in significantly higher water elevations and higher flow rates during high runoff and flood events. Updated channel analyses have not been performed to determine the amount of obstruction posed by vegetation and development in the Kaweah, Kings, or Tule River channels. As such, FEMA maps depicting the 100-year floodplain for the rivers probably do not reflect the true extent and risk of flooding hazards in Tulare County.”

157

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

<p><b>RDEIR (p. 3.6-33)</b> states that “Levees have been built throughout the region, primarily to increase available land for agriculture. Such levees rarely meet current standards for flood protection.”</p> <p><b>RDEIR p 3.6-53</b> states that “Until the County has implemented needed updates of its land use maps with current flood information, and met Safety Element provisions as now defined in Government Code 65302(g), flood related impacts of the proposed project will be significant.” <b>RDEIR p. 3.6-55</b> says, “<b>Under future climate change conditions, the hydrologic regimes the dams and levees were designed for may not be adequate to deal with new flood flow patterns.</b>”</p> <p><b>RDEIR (p. 3.6-55)</b> states that “Recent flood events, including Hurricane Katrina, have brought . . . a heightened awareness of the <b>dangers of levee failure . . . and increased public scrutiny of new development projects that are located in floodplain areas protected by levees . . .</b> the risk of living behind a levee system is there could be a minor, major, or catastrophic failure of the levee.”</p> <p><b>2008 DEIR (p. 4-87)</b> then went on to state disingenuously that the “County has no jurisdiction and is limited in terms of alternatives to mitigate for the identified risks.”</p>	<p>I17-721</p>
<p><b>The 2010 RDEIR completely omits discussion of the County’s responsibility for levees. Please explain why this was removed; please restore this important safety information.</b></p> <p>Per the Grand Jury report, as agreed to by the Board of Supervisors, “<b>The State of California Legislature formed the Tulare County Flood Control District (TCFCD) in 1972. . . . The Board of Supervisors serves as the governing board of the District. The District plans, designs, and maintains flood control projects within the County. Duties include maintenance of channels, pumps, and ponding basins. The District also administers FEMA’s National Flood Insurance Program, provides flood zone information, and performs flood control investigations.</b></p> <p><b>TCFCD is funded by Tulare County property taxes. It receives approximately \$350,000 per year. There are no active programs for levee maintenance or channel inspections within Tulare County.”</b></p>	<p>I17-722</p>
<p><b>The second paragraph of RDEIR p. 3.6-34 re the Tulare County Flood Control District says “The Act establishing the District provides the following powers to the District:”, but there is no list. Please provide the information regarding the District’s powers.</b></p>	<p>I17-723</p>
<p>The Grand Jury report identifies Ventura County as a good example of a well-managed flood control model, with both flood control and watershed protection elements including ground water recharge; funding is supported by numerous benefit assessment districts.</p>	<p>I17-724</p>
<p><b>The 2008 DEIR (p. 4-87) states that the “structural integrity of existing levees is an unknown. Therefore, this impact is considered potentially significant.” Please include strong, clear, enforceable Policies and Implementation Measures in this section that will directly address the levee and channel flooding hazards. Please do not permit any new residential development in these areas.</b></p>	<p>I17-725</p>

Levee and floodplain and natural waterway areas should be designated for open space, recreation, scenic landscapes, habitat, flood control, stormwater management, and groundwater recharge. Any development in these areas is at risk, puts humans at risk, creates impermeable surfaces and obstacles to hinder the performance and services of natural floodways, and puts a lot of toxic waste, trash, and other materials in the way of floodwaters, causing further damage to property and the environment. Allowing development in these areas also raises insurance costs, puts health and safety personnel at risk, and negatively impacts increasingly-rare habitat.	117-726
<b>HS-5.1 Development Compliance with Federal, State, and Local Regulations (GPR p. 10-8):</b> Please put the County Flood Damage Prevention Ordinance online for easy accessibility.	117-727
<b>IM #14 (p. 10-20),</b> which relies on FEMA floodplain maps for evaluation of projects; RDEIR p.3.6-30 says that the FEMA maps “probably do not reflect the true extent and risk of flooding hazards in Tulare County.” Please include a Policy to require regular and periodic channel analysis and update, with a concrete corresponding Implementation Measure. It appears that this will be required by Government Code Sections 65302 (d) and (g) (RDEIR p. 3.6-29, last paragraph).	117-728
<b>HS-5.1</b> has added a new second sentence: “New development and divisions of land, especially residential subdivisions, shall be developed to minimize flood risk to structures, infrastructure, and ensure safe access and evacuation during flood conditions.” This is good, but vague. What will make this happen? Will new development and divisions of land not be permitted in floodplains and levee areas? <b>Please make this Policy strong and clear and give it an effective IM.</b>	117-729
<b>IM#14 (p. 10-20),</b> which says only that “The County shall maintain and annually update a Countywide database of FEMA flood plain maps to <i>evaluate projects</i> and provide to County residents, businesses, and developers.”	117-730
<b>HS-5.2 Development in Floodplain Zones (p. 10-9):</b> This Policy appears to allow residential subdivisions to be developed in the 100-year floodplain zones. Is this correct? Is this why these subdivisions shall be developed to ensure safe access and evacuation during flood conditions? Who will pay for these evacuations? <b>Please do not permit residential subdivisions in areas likely to be flooded,</b> for the reasons listed above.	117-731
<b>IM #14 (p. 10-20),</b> which relies on FEMA floodplain maps for evaluation of projects; RDEIR p.3.6-30 says that the FEMA maps “probably do not reflect the true extent and risk of flooding hazards in Tulare County.” Please include a Policy to require regular and periodic channel analysis and update, with a concrete corresponding IM.	117-732
<b>NOTE:</b> We found the Tulare County Flood Control District Flood Control Master Plan online. It is dated June 4, 1971. Is this the most current Plan? Also online is the Tulare County Flood Control District Flood	117-733

Control Master Plan Hydrology Appendix, revised June, 1973. Is this the only document related to this plan? Please put it online, so that it will be readily available.	I17-733 cont'd
HS-5.4 Multi-Purpose Flood Control Measures (p. 10-9): Please clarify and strengthen this welcome Policy and provide it with a concrete Implementation Measure. How will the County “encourage” these projects? Certainly we need all the groundwater recharge facilities we can get.	I17-734
HS-5.10 Flood Control Design (p. 10-10): Please strengthen this Policy and give it a concrete, enforceable Implementation Measure. To say that the County shall “avoid” channeling, straightening, and lining waterways only until it has “studied” alternatives provides far too little direction for doing the right thing. And that was the 2008 version. The 2010 version changes “shall avoid” to “shall evaluate.” Why was this change made? When are the “alternative multipurpose modes of treatment” going to be studied? Aren’t there many examples of these already available to use as models? Please ensure that channeling, straightening, and lining waterways shall be an absolute last resort. Those methods provide for no recharge, no water filtration and cleaning, and no habitat, and they increase flood velocities.	I17-735
HS-5.11 Natural Design (p. 10-10): Please strengthen this Policy and give it a concrete, enforceable Implementation Measure. “Encourage” is far too vague.	I17-736
HS-6.4 Encourage Cluster Development (p. 10-106): Please strengthen this Policy and give it a concrete, enforceable Implementation Measure. “Encourage” is far too vague. Are there any examples of cluster development in the County? If so, where are they?	I17-737
HS-6.6 Wildland Fire Management Plans (p. 10-11): Please clarify what these management plans must include, when and where they must be filed, how the plans’ required actions will be funded and carried out, and how they will be monitored and enforced; please provide a concrete Implementation Measure for this Policy. Will these plans be required for <u>all</u> projects that adjoin open space areas subject to wildfire?	I17-738
HS-6.7 Water Supply System (p. 10-11): Thank you for including the fire flow requirement in this policy.	I17-739
HS-6.9 Fuel Modification Programs (p. 10-11): Please clarify how the County shall “support” these programs, and please provide a concrete Implementation Measure for this Policy. These programs should include re-establishing natural fire regimes on public lands.	I17-740

**HS-6.12 Weed Abatement (p. 10-11):** Please clarify how the County shall “encourage” these programs and provide a concrete Implementation Measure for doing so. Please include that weed abatement programs should be by mechanical or natural means wherever possible, avoiding the use of toxic herbicides. | I17-741

**HS-6.13 Restoration of Disturbed Land (p. 10-11):** Please clarify how the County shall “support” this restoration and provide a concrete Implementation Measure for doing so. Please ensure that restoration will be done with native plant materials, so as to restore habitat and not introduce alien and invasive species. | I17-742

**HS-6.15 Coordination of Fuel Hazards on Public Lands (p. 10-12):** Please clarify this very vague Policy. How will the County “support” efforts to reduce “fuel related hazards” on public lands? What is meant by fuel related hazards? Wildfires?. This Policy should prefer re-establishing natural fire regimes on public lands to reduce the incidence of very hot, fast, extensive fires and restore natural patterns of succession. One of the greatest “fuel related hazards” to public lands is the public. As pointed out in the Background Report, most wildfires are human caused. This is a good reason to very carefully limit and appropriately design development adjacent to public lands. | I17-743

**HS-7.7 Search and Rescue (p. 10-12):** “Should” is not a Policy statement. Will the County do this or not? Please revise accordingly. | I17-744

**HS-8.11 Peak Noise Generators (p. 10-15):** This welcome new Policy states that the County shall limit noise generating activities to normal business hours and not allow peak noise activities outside of normal business hours without County approval. | I17-745

Turning to the Implementation Measure to see how this will be enforced, we find **IM #22 (p. 10-22)** stating that the County “*should* develop and adopt a peak noise standards ordinance,” with a timeline of 2010-2015 (it was 2007-2010 in the 2008 version). Does this mean that the County presently has no peak noise standards ordinance, meaning that Policy HS-8.11 can’t be enforced? Please provide a concrete, measurable IM for this important Policy. “Should” is optional. There must be many good model peak noise ordinances. Why couldn’t we pick one and adopt it this year? As the County’s population booms, controlling noise impacts becomes ever more important to health and quality of life. | I17-746

The 2008 DEIR (pp. 4-98-99) listed six new “required mitigation measures” to address noise impacts (HS-8.12 – HS-8.17), but none of these appears in the 2010 GPR (however, they are all listed on RDEIR p. ES-8, etc . ) None of these have Implementation Measures. A new Policy HS-8.12 has been added to the GPR: | I17-747

**HS-8.12 Foothill and Mountain Noise (p. 10-15):** It is wonderful to see this new Policy requiring less noise in Foothill and Mountain Planning Areas than in other areas, since one of the greatest benefits of these areas is their | I17-748

Comments from Laurie and Greg Schwallier 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

natural peace and quiet. **Why doesn't this Policy apply inside the Foothill Development Corridors? How will this Policy be enforced?** Looking for an Implementation Measure, we found none listed for HS-8.12.

I17-748  
cont'd

However **IM#21 (p. 10-21)** says that the "County shall adopt the Tulare County Noise Ordinance to incorporate standards set forth in the Health and Safety Element," with a timeline of 2010-2015. The 2008 version said "The County shall amend and enforce the Tulare County Noise Ordinance to incorporate standards . . . ,," with a timeline of Ongoing. **So, when and how is this Policy going to go into effect?**

I17-749

**HS-8.13 Noise Analysis (p. ES-9, etc.)** requires the project applicant to have a qualified acoustical engineer prepare a detailed noise impact analysis in certain areas, and to include recommendations and evidence to establish mitigation to reduce noise to acceptable levels. **This Policy should require that the engineer be acceptable to the County (e.g., not any employee of the applicant, etc.) and it should state what will happen after the analysis and recommendations are submitted.** Given the County's rapid population increase, ever heavier traffic, and need to require greater energy efficiencies to reduce GHG emissions, **the County should require insulation exceeding Title 24 requirements by 10 or 15% and double glazed windows on all new construction.** That should help a lot to reduce noise to acceptable levels while serving other important functions as well.

I17-750

**HS-8.14 Sound Attenuation Features (p. ES-9, etc.):** As discussed before, such buffers should be substantial enough to provide multiple benefits (e.g., trails and bike paths, plenty of native large-canopy trees, floodways and recharge areas, etc.).

I17-751

**HS-8.15 Noise Buffering (p. ES-9, etc.):** Please see comments on 8.14 and 8.13 directly above. Ditto for HS-8.16 and HS-8.17.

I17-752

**HS-8.18 Construction Noise (p. ES-9, etc.):** This Policy states that the County "shall seek" to limit the potential noise impacts of construction by limiting construction activities to "7 am to 7 pm Monday through Saturday" when construction activities are located near sensitive receptors." **How will the County "seek" to do this? There's no IM. Please explain how this Policy is related to HS-8.11 (GPR p. 10-15),** which states that the County shall limit . . . construction to *hours of normal business operation.*" To most people, "hours of normal business operation" would mean 8 am to 5 pm Monday through Friday, except that in the summer construction work usually starts and ends about an hour earlier. It is egregious to subject anyone within hearing of construction activities, which tend to be extremely noisy, to construction noise when they get home tired from work (for most people, that's about 5:30, after "normal business" hours) and on Saturdays as well. **Please clarify and reconcile these Policies, provide them with meaningful IMs, and do not allow construction noise after 5:00 p.m. or on Saturdays.** Give our overloaded ears a rest.

I17-753

10.9 Healthy Communities (GPR p. 10-15)

117-754

HS-9 (p. 10-15) is a new Goal: "To support healthy lifestyles among residents of Tulare County through the built environment and land use decisions that play an important role in shaping the pattern of community development, in either promoting or discouraging good health for its citizens." Now we're cookin'! This is a very important Goal, long overdue.

Tulare County's population is not very healthy, and much of it is significantly under-served medically. The County Health Rankings website (<http://www.countyhealthrankings.org/california/tulare>) ranks Tulare County 49<sup>th</sup> out of California's 56 counties in health outcomes, 47<sup>th</sup> in morbidity, 56<sup>th</sup> in health factors, 55<sup>th</sup> in health behaviors (e.g., adult smoking and obesity), 47<sup>th</sup> in clinical care (e.g., primary care provider rate, preventable hospital stays), 55<sup>th</sup> in social and economic factors (e.g., education, unemployment, children in poverty, single-parent households), 51<sup>st</sup> in physical environment (e.g., bad air days, access to healthy foods).

117-755

However, as the California Medical Association says, "Improving land use and transportation planning is a key component of . . . efforts to fight global warming, air pollution and chronic illness. Transportation sources account for . . . 41% of greenhouse gas emissions in California. Motor vehicles represent California's largest source of greenhouse gas emissions and the majority of air pollutants such as ozone and particulate matter that contribute to an estimated 19,000 premature deaths each year in the state. Reducing driving offers a wide range of public health benefits and is vital to California's goal of reducing greenhouse emissions to 1990 levels in 2020 and achieving an 80 percent reduction by 2050." "California has adopted cleaner vehicle and fuel requirements to reduce harmful emissions . . . . However, as California's population grows, increased driving will overwhelm these state efforts to control emissions" as VMTs increase more rapidly than population growth. "Reducing vehicle trips and increasing options for walking, biking and other active transportation contributes to improved air quality and public health benefits.

In addition to reducing air pollution and its harmful effects on cardiovascular and respiratory health, research indicates that compact, mixed-use communities that reduce dependence on motor vehicles can:

- Encourage residents to incorporate physical activity into everyday activities and reduce chronic health risks such as obesity, diabetes, heart disease, cancer and depression;
- Improve local access and transportation to nutritious foods and health care services that are often out of reach in low income communities and communities of color; and
- Reduce injuries as motorists are less likely to strike a pedestrian or bicyclist as more people choose walking and biking."

As discussed in several places in our comments, the GPU/RDEIR fails to provide an adequate description of the existing health of Tulare County residents, the impacts of land use and planning decisions on health, the costs of poor health to the County, and a clear comparison of how the RDEIR Alternatives would affect health in the County. The RDEIR also fails to provide a clearly environmentally superior alternative, which would

163

mandate healthy growth for a healthier population. Unfortunately, the two new Policies to support this goal, HS-9.1 and HS-9.2, as written are too vague to ensure that visible progress will be made in the near future. 117-755 cont'd

**HS-9.1 Healthy Communities (p. 10-15):** What determines feasibility in “To the maximum extent feasible?” How will the County “strive through its land use decisions to promote community health and safety?” Which land use decisions? Promote how? If the County is truly committed to this, why is this GPU/RDEIR not designed throughout to reduce VMTs, promote active transit and public transit, require compact, resource-efficient, multi-use, higher-density, “greener” development? 117-756

What is meant by “encouraging patterns of development that are safe and influence crime prevention?” Is this a reference to CPTED? (If so, see our comments on the County’s commitment in the Land Use section: LU-7.5 “Crime Prevention Through Design” (p. 4-31): 117-757

This Policy is too vague (“encourage), and its only IM (#22, p. 4-36) says only that the County will work with others to research CPTED guidelines and develop standards as an informational tool for developers sometime in the next 5 years. CPTED guidelines and models are available online; providing information to developers does *not* require anything to happen. ) In Policy HS-9.1, what does the County mean by “a high-quality physical environment,” and how will the County “promote” it? Where will the sidewalks and walking and biking paths come from, and when?

IM#23 (p. 10-21) says the County “shall *work with* the Tulare County Redevelopment Agency, special districts, private developers, and local communities *to add health elements to community plans* that promote physical activity.” This is shown as New program with an Ongoing timeline. How and when will this cause anything to happen? Does this mean when the County can get around to getting community plans developed for the numerous communities that have never yet gotten them, since 1974? Or could it be when the several community plans that are well overdue for updates get updated? Or does it mean “communities” in general and “plans” in general? If the “health elements” added to those plans are as vague, unmeasurable, unenforceable, and indefinite as this Policy and its Implementation Measure, we can hold out little hope for Healthy Communities. Please make this Policy and its IM concrete, meaningful, measurable. 117-758

How about some goals on miles of walking and biking paths to be completed each year for the next 5 years? How about requiring tree planting and maintenance, with X many trees to be planted and maintained each year for the next 5 years? How about X thousand yards of sidewalk? How about at least one significant Safe Route to School completed each year? How about a model CPTED development to be completed by 2015? We need more than vaporware here. Please provide some real objectives here, and the means to make them happen.

The GPU/RDEIR documents should provide baseline information on how much development of what kind we have in the County now, in terms of type of units, number of units, number of acres of each type of unit, locations, 117-759

164

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

affordability, density, access to transit (within ¼ mile), access to school (within 1 mile), access to a park and recreation (within a mile), access to a community garden, access to employment opportunities, access to a good grocery store, a post office, an ATM, access to medical care, and a few more useful indicators, in order to evaluate what percentages of what types of residential development we have now, and what it costs.

**How much smart, compact, resource-efficient, alternate-transit friendly, development do we have, both numerically and as a percent? Do we have 5%? 10? What if we could move that to 50% or more during the plan horizon? And what if through developer fees and mitigation money and assessment districts and maybe some grant money, we could start remodeling some existing developments along these lines? And what if community members saw that this type of community would be safer and healthier and more fun to live in so they pitched in and came up with ideas and volunteered to do some of the work and built their sense of community and took pride in what they did?**

Look at Woodlake's fabulous community garden. Look at Exeter's murals. Look at those delightful, walkable community centers with everything just a block or two away – including some good places to eat! Let's connect some small places with walking/biking trails. Let's get tourists on the trail, cruising along under majestic valley oaks, watching hawks soar overhead, following county lanes, enjoying produce from the farm stands, and stopping at our rural towns for some authentic food, attractive scale and historic buildings, and shopping for clothes and other gear they don't find at home. We've got potential; let's build healthy and live healthy.

**Let's look at the baseline again. Let's show our statistics if the GPU project is built as proposed. Let's show our statistics with the project built as a true healthy growth project. What are the relative costs and benefits? Which way should we choose?**

**IM#25 (p. 10-22):** This says the County "is to consider" the preparation of a Healthy Communities Element in the General Plan. The timeline is 2015-2020. **What does this mean?** Writing an Element to be included in the General Plan 2030 Update? **What would this Element comprise? Could it be a model Element** that could serve as a starting point for all the communities that want to adopt such an Element for their plans? You could probably get a lot of volunteers to help work on this. The problem is that "is to consider" just doesn't cut it as an IM: not measurable, not concrete, not enforceable. **Please revise accordingly.**

Also, to be Healthy, these communities **will have to be built to be highly resource-efficient (water, land, air, materials, energy, etc.) and to use the natural features of the land for their evolved purpose wherever possible (e.g., natural drainage, floodways, groundwater recharge, habitat, etc.**

**HS-9.2 Walkable Communities (p. 10-16):** This says that the County "shall require *where feasible*, the development of parks, open space, sidewalks and walking and biking paths that promote physical activity and discourage automobile dependency in all future communities." **What's going to determine "feasibility?"** Let's get some Quimby going here after all these years. Let's require that neighborhoods have places for kids to play. **How (by what means?) will the County require this type of development? When will this Policy become**

I17-759  
cont'd

I17-760

I17-761

I17-762

165

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

effective? It says it will apply to “all future communities.” Does this mean communities that don’t yet exist (e.g., New Towns)? Or does it mean just any new development? **Please clarify this vague policy and give it some IMs with big teeth to make it happen.** We need to see some of these communities soon. **Remember not to build big walls around them; be sure they have complete streets; don’t forget the trees; connectivity is important; a community garden would be great.** Please be very sure to include lots of community stakeholders throughout the planning and development stages of both these Policies. These walkable communities must also be healthy in terms of resource efficiency, as discussed above for the Healthy Communities. Be sure to locate them near jobs and schools.

I17-762  
cont'd

**IM#24 (p.10-22):** This IM says the County “shall develop a healthy community checklist for new residential, commercial, office, and public developments that lists standards for land use, transportation, street design, parks, and open space.” This is another New Ongoing IM. A checklist is a great idea.

I17-763

**Where is it, if it’s ongoing? If it’s done yet, when will it be done? What’s on it? When and how will it be used?** Please make this IM concrete and useful. When will we see results from the checklist? Is it just a memorandum, or is it something enforceable.

## 11. WATER RESOURCES (GPR p. 11-1 ff)

I17-764

The General Plan Update documents leave the public and decision-makers with many unanswered questions regarding the adequacy and sustainability of the County’s water resources. The baseline information is disorganized, piecemeal, incomplete, inconsistent, and inadequate. The impacts on water resources of projected growth, of agriculture, of contaminants, of litigation results, and of accelerating global warming are inadequately described and discussed. Far too many of the related policies and implementation measures are vague and inconclusive, and they cannot serve as effective mitigating policies and mitigation measures for the impacts described in the RDEIR. The relationship between water supplies and land use designations is not disclosed, and it is not at all clear how or whether the County means to direct land use and growth in relation to water supplies.

**Key Terms -- Acre-foot (GPU p. 11-1) and Groundwater Export and Groundwater Overdraft (p. 11-2):** The Acre-foot definition states that an acre-foot comprises 325,851 gallons. The Groundwater Export definition says that one or more acre-feet is the measuring unit for export. **Does that mean that if someone were to export “only” 300,000 gallons of groundwater in a year, it wouldn’t count, since it would be less than an acre foot (even though it would be almost enough to supply two households for a year) ?**

I17-765

**The Acre-foot definition** states that an acre-foot comprises 325,851 gallons, and the national average daily per capita water usage is 160 gallons. **What is the average daily per capita water usage in Tulare County? What is the average daily usage per dairy cow (we have far more of those than of humans)? Does the “per capita” use**

I17-766

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

figure count only the water used directly for human domestic needs, or does it just take the total annual usage for an area and divide it by the number of people living in the area?

I17-766  
cont'd

**WATER USE INFORMATION IS DEFICIENT AND INADEQUATE IN THE GPR, BR, AND RDEIR:**

I17-767

In other words, the GPU/RDEIR should **determine and analyze (approximately) what the per capita use is in Tulare County on the basis of household use, and also the total for household use, and then figure about how much is used by agriculture (and perhaps break that out among row crops, tree crops, dairies, range animals, etc.), and then figure out what the share is for commercial and industrial uses.** Since we have a huge and continuing groundwater overdraft, our snowpack is shrinking, our imported water supply is in jeopardy, and our population (both human and cows) is growing very rapidly, and the GPU is designed to try to attract even more industry and population, and to develop large new greenfield areas (e.g., the proposed New Towns, such as the proposed Yokohl Ranch, which will apparently rely on importing water from somewhere), what will our projected water use be at buildout of the General Plan? **The Existing Conditions Overview (GPR p. 11-3) and the Background Report and the RDEIR must present a comprehensive, meaningful, and relevant picture of Tulare County's current water supply and current uses, and must then project them as accurately as possible through the buildout of the General Plan. The RDEIR must carefully evaluate how the different Alternatives proposed would affect this water budget.**

We simply can't live without water, and **global climate change** will be affecting our neighbors as much as us, which could certainly negatively affect our supply of imported water.. The tremendously threatened Bay Delta could become increasingly saline due to continued massive pumping of its water into the Central Valley while climate change continues to cause sea levels to rise. **Existing water storage systems** will become less effective as they silt up and as runoff and precipitation patterns change due to global climate change. **Continued overdrafting** could reduce the ability of our groundwater aquifers to store water; in the worst case, we could use up our underground water supply, since we don't know how much is available. Clearly, our monstrous overdrafting far exceeds Safe Yield. The Existing Conditions Overview in the GPR (p. 11-3 – 11-4) also gives the reader no idea that **many of our communities have severe water quality problems.** Nor does it adequately discuss the **nature and extent of water supply contamination** by human activities, other than to mention leaking storage tanks. Septic systems, agricultural activities, manufacturing, construction, and other sources should be listed and their impacts assessed. The potential costs and benefits of conservation, recycling, and reuse of water resources should be reviewed and evaluated. **The GPU/RDEIR must make clear what we must address, the impacts of our current and projected uses and operations (including the project's impacts on GHGs and global climate change, and climate change's likely impacts on the project), and what our options are for avoidance or mitigation of these impacts in order to fulfill its informational requirement and provide the reader with a meaningful and much more complete understanding and basis for decision-making.**

I17-768

**Existing Conditions Overview (GPR p. 11-3):** The first paragraph under this heading states that Tulare County has **four major sources of water:** groundwater, local streams and rivers, imported surface water, and imported

I17-769

167

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

surface water by exchange. **What percentage of the County's water use is supplied by each of these sources? How are the sources divided among agricultural, commercial/industrial, and domestic consumption? Is almost all of the County's drinking water supplied by groundwater? Is agriculture by far the greatest consumer of the County's water resources?**

117-769  
cont'd

**Please include:** "All but one of the communities in Tulare County rely on groundwater for their water supply. Many communities' well water contains nitrates, arsenic, and other contaminants. These pollutants occur naturally and as a result of human activity. Several communities and many agricultural operations rely on surface water, pumped via pipes and canals, to augment their groundwater supplies. Now a long-argued legal case is being settled, and much of the water that these communities relied on for expansion of crops and population may no longer be available to them. **Water and energy use are related:** in California, approximately 19% of all electricity, 30% of all natural gas, and 88 million gallons of diesel are used to convey, treat, distribute, and use water and wastewater. This results in very substantial GHG emissions, exacerbating global climate change."

117-770

The **third paragraph (GPR, p. 11-3)** states that extensive **alluvial fans** associated with the County's rivers provide the highly permeable areas in which groundwater is readily replenished. **Are these alluvial fans also the areas in the County that are the most urbanized (and therefore the most covered by impermeable surfaces, impeding groundwater recharge, and the most subject to human-caused pollution), and also the most intensively agriculturalized (and therefore the most polluted by agricultural chemicals, confined animal facilities, etc.)?**

117-771

The **fourth paragraph (GPR, p. 11-3)** states that Tulare County has the greatest overdraft projected in the state (56% of the total), estimated at 820,000 acre-feet per year. It states, egregiously, that the overdraft is due to reductions in surface supplies due to Delta export restrictions and ESA requirements. **Would it not be more accurate to state that the overdraft is due to huge increases in population, water-intensive agriculture, and the dairy industry? If so, please revise the overdraft sentence.**

117-772

The **fifth paragraph (GPR, p. 11-3)** states that there are 19 entities in Tulare County with active groundwater management programs. **Is it correct that Tulare County does not yet have a Groundwater Management Ordinance** (the California DWR list, dated 12/04 does not show Tulare County among the 28 counties that have such ordinances, including Fresno and Kern)? If not, given the County's impending water crisis, does Tulare County mean to adopt such an ordinance? If so, when? **This paragraph should briefly discuss the County's involvement in and plans for dealing with this critical issue, and how this issue affects and would be affected by the County's GPU growth projections.**

117-773

The **seventh paragraph (GPR, p. 11-3)** mentions that predominantly individual systems supply water to the County, principally from groundwater, which is mostly untreated. **This paragraph should briefly discuss the**

117-774

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

County's involvement in and plans for dealing with the water supply systems, many of which are contaminated, at or near capacity (many in "Can't Serve" status), or old and dilapidated and in need of major repair, replacement, or expansion, and should explain how this situation affects and would be affected by the County's GPU growth projections. It should also discuss how many of these systems are contaminated, and explain how this affects and would be affected by buildout of the GPU.

I17-774  
cont'd

Why is there no mention in this introductory section of the likely impacts of global climate change on the County's water resources? Please include a paragraph on this key condition. Scientific models consistently project for California (and the West in general) as a result of human-induced global warming: earlier annual runoff from diminishing mountain snowpacks; sharply diminishing runoff totals; rapidly changing seasonal averages and extremes of snow, rainfall, river flow, and floods; and longer droughts and worse heat waves. These conditions will, of course, increase demands for water, and they make it urgent that local governments and planners respond with measures to deal with increased hydrologic uncertainty, including modifications to infrastructure and innovative solutions such as capturing storm waters for irrigation, groundwater recharge, and other uses. Tulare County is already experiencing these effects, with diminishing snowpack, earlier runoff, and hotter temperatures.

I17-775

**WR-1.1 "Groundwater Withdrawal" (p. 11-6):** The second paragraph on GPR p. 11-1 states that the County does not have direct regulatory control over water allocation or management and that the policies in this element should not be construed to insert the County into those activities. It also states that the County does have regulatory control over the approval of new land use development. WR-1.1 states that the County shall cooperate with other agencies during land development processes to manage the County's groundwater resources; the words" through ordinances, project approvals, and agreements" that were in the 2008 version have been deleted in the 2010 version. Why? Please clarify the County's powers and limitations in dealing with the key issue of managing water resources. What exactly can the County do to ensure an "adequate, safe, and economically viable groundwater supply for existing and future development?" If the various community service districts, irrigation districts, public utility districts, etc. are self governing and are not subject to County control, then how can the County ensure the groundwater supply? It may be noted here that communities such as Traver, El Rancho, Delft Colony, Seville, Tonyville, Yettem, Tooleville, and Wells Tract, which are under the County's jurisdiction (CSA #1 and #2) are all in Can't Serve status, and that 15 water and/or sewer districts are either under a cease and desist order or have other limitation for water and sewer connections as of 2007 (BR p 7-33). Please revise this Policy to include groundwater not just for development, but for habitat, scenic landscapes, and other natural resource lands in the beneficiaries of an adequate, safe groundwater supply (our groundwater should not be managed only for development).

I17-776

**Implementation Measure #1 (p. 11-11) for WR-1.1 and WR-1.2** says the County shall develop an ordinance that will regulate the extraction and exportation of groundwater from the County and require a

I17-777

<p>permit for export; six conditions are listed for the permit, including that the extraction will not “substantially” increase the overdraft of our groundwater and will not exceed the “safe yield” of the groundwater. <b>Please define “substantially” and clarify how, if we are already overdrafting 820,000 acre feet per year, we are not already greatly exceeding the safe yield.</b> Also, do these conditions apply only to a permit for export? <b>Can they be made to apply to any extraction of groundwater from Tulare County? There is NO mitigation for running out of water; we cannot live without it. We must start living within our means. Mother Earth does not do bail-outs.</b></p>	I17-777 cont'd
<p><b>Implementation Measure #2 (p. 11-11) for WR-1.1 and WR-1.2 and WR-1.8 states that solid waste disposal areas shall not be located where there is possibility of ground or surface water contamination. Please expand this IM to include Confined Animal Facility Operations, which also must not be located where there is a possibility that they will contaminate ground or surface water (too many of them are already causing contamination).</b></p>	I17-778
<p><b>Implementation Measure #3 (p. 11-12) for WR 1.1, 1.7, 2.5, 3.2, 3.4, and 3.7 states that the County shall assure that all watershed planning is done on a complete regional and watershed basis, balancing urban and agricultural demands. Please expand this basis to include habitat demands, groundwater recharge demands, scenic landscapes demands, and natural flood control demands. Please clarify how the County can assure this.</b></p>	I17-779
<p>Agriculture currently uses hugely more water in the county than do the urban areas. How can the County affect this balance?</p>	I17-780
<p><b>WR-1.2 “Groundwater Monitoring” (p. 11-6): This extremely important Policy needs to be made much clearer and needs much more concrete and enforceable IMs. In what ways will the County “support” collection of monitoring data? What types of data will be collected? Where will the data be stored and compiled and analyzed, and how will the data be used? It is critically important that the County learn what is happening to its groundwater supply because it cannot sustain <i>even its current level of population and development</i> without reliable groundwater that does not fall so low that it is too expensive to extract, and that must not become contaminated. Please include requirements in this Policy and its IMs to ensure collection, analysis, and reporting of this essential information. Of the IMs listed as implementing Policy WR-1.2, #1 and #2 (p. 11-11) seem to have nothing to do with Policy WR-1.2, unless the permits mentioned in IM #1 for groundwater extraction and export will include monitoring data (not mentioned). What data will be collected, and who will compile it? How will it be monitored? This important function should be clearly spelled out in IM #1.</b></p>	I17-781
<p><b>IM #4 (p. 11-12) says the County shall participate “where feasible” in groundwater monitoring and planning programs; this is listed as a “New Program,” with a timeline that is “ongoing.” What will determine the feasibility, and how will the County participate? Please provide an update on an example of a local groundwater monitoring program: The Introduction to the Animal Confinement Facility Plan/Final Program EIR (GPA 99-05) states (p. 1) that in January 1998, the Board of Supervisors</b></p>	I17-782
<p><b>IM #4 (p. 11-12) says the County shall participate “where feasible” in groundwater monitoring and planning programs; this is listed as a “New Program,” with a timeline that is “ongoing.” What will determine the feasibility, and how will the County participate? Please provide an update on an example of a local groundwater monitoring program: The Introduction to the Animal Confinement Facility Plan/Final Program EIR (GPA 99-05) states (p. 1) that in January 1998, the Board of Supervisors</b></p>	I17-783

adopted a "Quality of Life Program" setting forth a commitment to protect and enhance the quality of life for the residents of Tulare County and including a component that provided **resources to monitor the impacts of the dairy industry on the county's groundwater supply. What have been the results of this groundwater monitoring program** implemented by the County? What data have been collected and reported, and what actions have been taken on the basis of this information? Is this information available to the public? What information is available about the impacts of other industries on the county's groundwater supply?

I17-783  
cont'd

**IM #5 (p. 11-12): Please make this "Ongoing" "New Program" concrete and measurable. How will the County "encourage" participation** by local stakeholders and develop groundwater-monitoring partnerships? Who would these stakeholders and partners be? How would the groundwater-monitoring data be collected, stored, analyzed, and shared? **This IM, or a closely related one, should implement the Data Needs Assessment and Recommendations described in the Animal Confinement Facilities Plan Draft Supplemental Program EIR** (pp. F-12 and F-13) and discussed above under Policy AG-3. What are the results so far of this ongoing implementation measure? They should be indicated in the IM to indicate more concretely what this means.

I17-784

**IM #7 (p. 11-12):** The County states in the Matrix (p. 242, re IM #7) that "Since 2005 Environmental Health has required all new wells to be regularly tested for contamination." What contaminants are these wells tested for? How regularly are they tested? How are these results compiled and reported? Are they correlated with the results from the dairy monitoring wells? Are the results correlated with GAMA (Groundwater Ambient Monitoring Assessment Program) data? The County states on Matrix p. 243 that since August 2005, all new private domestic wells in the County will be tested for bacteria and nitrates, with DBPC tested for in the valley and radiological screening the mountains. Is this the same testing that is referred to on p. 242? If so, then are only new **domestic** wells being tested? What about agricultural wells? This well monitoring information is vital to the County's water future. Please make the collection and correlation and reporting of water quantity and quality data as comprehensive and continuous and mandatory and frequently reported as possible, **and revise this IM to indicate that this is the intent of this very important measure, which is essential to safe planning and development.**

I17-785

**WR-1.3 "Water Export Outside County" (p. 11-7):** This is an important policy for sustaining the County's water supplies, but it is vague and confusing.; **please clarify the Policy.** By what means can the County regulate export of water already allocated to County users? How can the County tell whether water is being "permanently" exported? When will regulation be necessary "protect the public health, safety and welfare?" Will this be if we know we're running out? The second sentence says, "The County **shall strive for a 'no net loss' .where there mayb e water exchanges serving a public purpose.**" What if the water exchanges aren't serving a public purpose? Does the County know know how much "net loss" the County is experiencing due to water exports? How do we know? **It is also EXTREMELY important to insure that water returning to the County to provide for "no net**

I17-786

171

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

loss” is of the same or better quality than what we exported; please include this provision in this Policy.

Please revise.

117-786  
cont'd

Only IM#1 (p. 11-11) is cited for this Policy, stating that the County will develop an ordinance sometime in the next five years (2010-2015); the 2008 GPR said this Ordinance would be done by 2010; please try to make this deadline. Our water supply is decreasing drastically every day.

117-787

**WR-1.4 “Conversion of Agricultural Water Resources” (p. 11-7): Please make this vague Policy**

**(“discourage”) clear and provide it with a concrete, measurable Implementation Measure.** How will the

County “discourage” the transfer of water? What criteria will be used to establish that the water remaining is

“sufficient?” How will turning the agricultural soil into urbanized hardscape not significantly reduce infiltration to groundwater? This issue **MUST** be addressed in terms of cumulative impact, **NOT** on a piecemeal basis.

117-788

This Policy has been significantly reworded from the 2008 version. **Please justify why it now says “discourage the transfer of water . . . including but not limited to,”** very much weakening the intent from the previous

“discourage . . . unless all of the following are met.” **Additionally, please explain why the 3<sup>rd</sup> bullet in the 2008**

**version has been eliminated in the 2010 version:** “The water transferred to the domestic use is equivalent to an amount saved by the agricultural use through implementation of a conservation program (such as installing drip irrigation) or conversion to less water intensive crops.”

(Given the County’s gigantic overdraft, reductions in imported water, and shrinking snowpack, agricultural users should be implementing conservation programs such as installing drip irrigation and converting to less water intensive crops anyway, and the water “saved” should be going to groundwater recharge to reduce the overdraft, not to new urban development.)

**WR-1.5 “Expand Use of Reclaimed Water” (p. 11-7): Please clarify this vague Policy,** which implies through

its title some relationship between reclaimed wastewater and augmenting groundwater supplies and conserving

potable water. **From what sources and by what means would wastewater be reclaimed?** How would the

reclaimed wastewater augment groundwater? Through use in irrigation? How would it conserve potable water?

Would restrictions be placed on how potable water could be used? Where is this discussed in the Background

Report and the RDEIR?

117-789

**IM #6 (p. 11-12) for Policy WR-1.5 “Expand Use of Reclaimed Water” says nothing about reclaimed**

**water. How does it implement policy WR-1.5?** The IM does address established recharge sites, aiming

to avoid their destruction by “clustering development to leave such areas in open space.” As discussed

above, **none of the GPR’s policies and IMs regarding clustering are sufficiently clear, concrete,**

**measurable, or enforceable to require or produce any clustering at all. What is meant in this IM by**

**“alteration of existing agricultural practices?”**

117-790

**IM #10 (p. 11-13) for Policy WR-1.5 “Expand Use of Reclaimed Water”** states that the County shall incorporate provisions for the use of reclaimed wastewater, water conserving appliances, drought tolerant landscaping, and other water conservation techniques into the County’s building, zoning, and subdivision ordinances; the timeline is “Ongoing.” **What are the provisions for reclaimed wastewater use, and where specifically in the building, zoning, and subdivision ordinances can they be found? How much wastewater is being reclaimed by these provisions, and what is the County’s goal for wastewater reclamation and use?** The same questions apply to water conserving appliances, drought tolerant landscaping, and “other water conservation techniques.” What specifically is the County requiring, where specifically are the requirements to be found, what effect are they having, and what are the goals? **This information should be provided in the Background Report and the RDEIR. Given the County’s impending water crisis, it is essential to provide concrete, measurable implementation measures that enable monitoring and regular reporting; please modify this IM accordingly.**

I17-791

**WR-1.6 “Expand Use of Reclaimed Water” (p. 11-7):** This very important Policy is far too vague to be enforced and has no Implementation Measure. **Please correct these deficiencies.** How shall the County “encourage” use of treated wastewater and gray water? Does the County have the authority to cause such use to occur? Do tertiary treatment plants currently exist in the County? Where are they located? What is their capacity? What happens to this water now? What would be required to distribute the treated water to agricultural and other lands to reduce groundwater demands? Could this significantly reduce groundwater demand?

I17-792

**WR-1.7 “Collection of Additional Groundwater Information” (p. 11-7):** This very important Policy and its Implementation Measures (#3,#7, # 8, and # 9 on p. 11-12, and #11 on p. 11-13) are woefully vague and do not provide for measurement, monitoring, or reporting on a coordinated, accessible, regional basis. **How will the County “support” studies, per WR-1.7, to understand groundwater sources and basins?** This information is vital to the County’s land use and planning decisions, but it seems to take the form of scattered facts that cannot be turned into reliable, comprehensive information.

I17-793

Please see above comment on IM #3 (under WR-1.1).

to install and monitor additional wells in areas where data gaps exist. The County responded that “This is not within the County’s jurisdiction.” So, **IM #8 apparently cannot be relied on to have any force or effect. By what means would the County “encourage” the other agencies and organizations?** Who would compile, coordinate, and report the data from the wells?

I17-794

**IM #9 (p. 11-8):** This IM has been completely changed from its 2008 version, which said, “The County shall seek cooperation from realtors to require all sales of homes to have water testing for nitrates and bacteria in addition to valley sites testing for DBCP and mountain sites for radiological contamination.” The 2010 version says that “The County will research the development of an education program to inform homeowners in the Valley and Mountain areas regarding water quality concerns.” Researching

I17-795

173

development of a program, of course, does not implement anything, nor is it clear how this IM relates to the Policy of collecting additional groundwater information. However, it is important for homeowners to learn about these water concerns. Could this be required disclosure in all real estate transactions?	I17-795 cont'd
<b>IM #11 (p. 11-8):</b> How will the County identify and evaluate conditions causing deterioration of water quality, supply, and yield? <b>Please make this very important IM concrete and measurable;</b> how can progress on it be monitored, and how will it be reported? What baselines are available? Will the necessary revisions to the regulatory documents be publicized? Will there be ongoing monitoring for compliance and results? The information in the Background Report indicates that major conditions causing the deterioration of our water resources are overdrafting and human-caused contamination. How can the County regulate these through the Zoning Ordinance and the Subdivision Ordinance?	I17-796
<b>WR-1.8 “Groundwater Basin Management” (p. 11-7):</b> Please make this very vague Policy specific and meaningful. What does “take an active role in cooperating” mean? Going to meetings? Revising ordinances? Cooperating with whom? The Policy’s two Implementation Measures (#2, p. 11-7 and #11, p. 11-8) are discussed above; please incorporate those comments here as well.	I17-797
<b>WR-1.9 “Collection of Additional Surface Water Information: (p. 11-4):</b> Please make this very vague Policy clear and meaningful because it is important; please provide it with a concrete, measurable Implementation Measure (it has none). How will the County “support” the additional collection of water quality and flow information? Who will compile and coordinate and analyze and report this information? How will this information be related to planning and land use policy- and decision-making?	I17-798
<b>WR-1.10 “Channel Modification” (p. 11-7):</b> Please strengthen “discouraged” to “prohibited” in this important Policy (and also correct the agreement error: “Channel modification shall be . . . where it increases . . . <i>has</i> adverse effect . . . or <i>modifies</i> . . . recharge”). Please see above comment on <b>IM #6 (p. 11-12)</b> and incorporate it here also. <b>Please change IM #13 (p. 11-13):</b> “Stream crossing points <i>shall</i> involve a minimum disturbance . . . near natural drainages <i>shall be</i> avoided.”	I17-799
<b>11.2 Water Quality (GPR p. 11-8 ff)</b>	I17-800
<b>WR-2 “To provide for ... needs . . . and for the protection of the quality of . . . water . . . resources”:</b> Somewhere under this Goal, perhaps under WR-2.1, or as a separate Policy, the GPR should include a Policy stating that the County shall ensure no net quality reduction in the case of water transfers or exchanges serving a public purpose (see Matrix p. 233, #1 under WR-1.3). The County must not transfer or exchange its high-quality water for water of a lesser quality.	

The Policies and Implementation Measures in this section should be described and illustrated in the Background Report and the RDEIR and their effectiveness currently and over the life of the GPU should be discussed so that the reader could be informed of the County's authority and activity and results in this extremely important area. Water availability and quality are a chief concern of the County's residents, but **the GPU/RDEIR documents provide the reader with no clear idea of what is actually being accomplished in these areas.** Thus, the reader does not have sufficient information to evaluate whether the Goal of providing for the County's long-range water needs and the protection of its water quality can actually be reached. How much clean water will the GPU at buildout require? How much can we save? How much can we guarantee from supplies that we can measure and control within the County?

I17-801

**WR-2.1 "Protect Water Quality" (p. 11-4):** This key Policy is supported by only two Implementation Measures, #12 and #14 (p. 11-13), both of which address soil erosion only. Please provide IMs for the other conditions referenced in this Policy. **Please include a specific reference to dairies**, as they are a major potential source of direct discharge, leaching from storage, floating debris, and runoff from the site; the County has at last begun to address these dairy issues, but is making very slow progress (when will the DSPEIR for the ACFP, in the works since 2001, be completed and adopted?).

I17-802

[We are wondering whether anybody is actually reading our comments. If you are reading our comments, please call us at 559-561-0111. We'd love to hear from you.]

I17-803

**WR-2.2 "NPDES Enforcement" (p. 11-8):** This Policy has three IMs, #12 and #14 on p. 11-13, and #15 on p. 11-14. The first two deal only with soil erosion. **#15** should have the commas removed in its first sentence.

I17-804

**Does the second sentence in #15 say what is intended?** Its "should" should be changed to "*shall*." The sentence as it is written says that channeling, etc. of waterways is prohibited until other modes of treatment are provided. The implication is that once the other modes are provided, then the channeling, straightening, and lining may occur. Is the intent that the channeling, etc. should be a last resort, and may not be considered unless alternative modes have been implemented and proven to be insufficient?

**Isn't the most effective and cost-effective flood control the maintenance of natural floodways in their natural land forms with their natural vegetation?** These could serve multiple purposes at very low cost (especially compared to the cost of channeling, straightening, and lining, and maintaining) as open space, habitat, groundwater recharge areas, and recreational preserves, remaining always ready to perform their natural function of flood control. The County's levee systems are already in disastrously poor condition, as discussed above and in the 2005-06 Grand Jury report. Let the floodways work as Nature made them.

**WR-2.4 "Construction Site Sediment Control" (p. 11-8):** Please specifically include dairies in this Policy, as they are required to comply.

I17-805

175

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

**WR-2.5 “Major Drainage Management” (p. 11-8-):** This is an extremely important policy that **must be clarified and strengthened**. How will the County “promote” protection of the drainage basins? What “hydrologic and use characteristics” will be considered? The only implementation measure shown for this Policy is #3 (p. 11-12), which is also vague and incomplete, as discussed above. The County is at a critical juncture regarding its water supply: already too much of our water is contaminated, already we are consuming our supply far faster than it is being replenished; already we know that our imported water will be reduced and our snowpack is shrinking. **Please include strong, clear, direct policies and implementation measures to protect our ever-more-precious water basins.**

I17-806

**WR-2.6 “Degraded Water Resources” (p. 11-8):** This very important Policy **must be made much stronger and clearer, and please provide it with a concrete, effective IM**. How will the County “encourage” and “support” the identification of degraded resources and “promote” restoration “where appropriate?” Where would it NOT be appropriate to restore water resources? Since we’re not making any more water, and the demands on our supply are ever-increasing, while our supply is shrinking, is it not essential to discover where we are losing this resource to degradation and do all that is possible to prevent and repair such degradation (preferably at the expense of the degraders whenever possible)?

I17-807

The only IM listed as related to this Policy was, in 2008, #13 (p. 11-13), which has to do with minimizing soil disturbance in natural drainages. Now it has **IM#17**, which says that in the next 5 years (formerly by 2010) the County will amend the well ordinance to require deeper seals in areas of known contaminants. This IM is not at all directly related to WR-2.6.

I17-808

**WR-2.7 “Industrial and Agricultural Sources” (p. 11-8):** This Policy is also much too vague to be enforceable and its Implementation Measures, #6 on p. 11-12 (the County shall avoid destruction of established recharged sites by clustering development , avoiding lining channels and streams, altering existing agricultural practices, substitutions made of drainage methods) and #16 on p. 11-14 (the County “shall consider” expanding the role of the Water Commission to “examine” contaminant management), both have “ongoing” timelines, and don’t seem likely to be prove effective..

I17-809

In the case of **IM#6**, where are the established recharge sites in the County? Where are examples of clustering development? What existing agricultural practices has the County altered? These approaches should be discussed in the Background Report and the RDEIR, with examples of their use and effectiveness. In the case of **IM #16**, given the level of and frequency of water contamination in the County, this casual approach seems designed to produce no positive effects at all. Please define how the County will “work with” agricultural and industrial concerns, and please provide concrete, measurable implementation measures, such as monitoring, inspection, and enforcement of strong ordinances. How long is the County going to “consider” expanding the Water Commission’s role? It’s already been well over 2 years since this

176

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

IM was written! Once the Water Commission, if asked, has examined contaminant management, then what? **Please include a charge to the Water Commission to analyze and recommend policies and implementation measures for education and BMPs re nitrates per the Salinas Valley model discussed on Matrix p. 246.** Nitrates are not being sufficiently specifically addressed in the Water Resources Element, but they are one of our most prevalent and unhealthful contaminants.

I17-809  
cont'd

**WR-2.8 "Point Source Control" (p. 11-8):** How will the County "work with" the RWQCB? **Please clarify this Policy. What kind of inspecting, monitoring, and reporting will be done?** We are very concerned because it seems that efforts to manage water pollution in Tulare County are insufficient, in that so many wells, when tested, are contaminated. What would it take to get ahead of this problem? More funding? More staff? More monitoring wells? Better mapping? More inspection? Stronger regulations? Stricter enforcement? The only IM for this Policy is #6 (p. 11-12), which is discussed directly above.

I17-810

**WR 2.9 "Private Wells" (p. 11-9):** It is wonderful to find a new Policy with a fairly concrete Implementation Measure (#17 on p. 11-14). But shouldn't the IM require deeper seals on all wells, not just in areas of known contaminants? Wouldn't that be safer? What if a well is being drilled in an area that hasn't yet been tested for contaminants? How deep will the seals have to be? Will the required depth make allowance for the generally declining groundwater table? Unfortunately, this safety issue, previously scheduled for completion by 2010 (amending the well ordinance), is now postponed until 2010-2015. Please shorten this timeframe.

I17-811

## 11.3 Water Supply (GPR p. 11-9 ff)

I17-812

**WR-3 (p. 11-9)** has been revised. The Goal has been changed from "to assure that new development is consistent with available water resources" to "to assure that new *urban* development is consistent with available water resources." **Why has this change been made?** The County permits significant non-urban development, such as confined animal facilities, that have tremendous impacts on water resources. **Please restore the original meaning by changing the wording to "assure that *all* new development is consistent with available water resources."**

**For this section also, the Background Report and RDEIR must provide much better information. How much water will be required at buildout of the GPU?** Since our current water use is already unsustainable, how can we provide for a sustainable long-term supply unless we reduce population and/or drastically and permanently reduce current levels of consumption (domestic, agricultural, industrial)? **How much can we document in water savings from each of the listed Policies and Implementation Measures? How many of these are proven? How many of them have already achieved about as much savings as they can achieve, so that their utility is already maxed out, or close to it (e.g., Supervisor Ishida has said that agriculture is already doing all that it can to save water)?**

I17-813

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

177

**WR-3.1 “Develop Additional Water Sources” (p. 11-9):** New language has been added to this Policy to strengthen and clarify it. It now says the County will not just “encourage,” but “shall *encourage, support and, as warranted, require*” the identification and development of additional water sources. It qualifies groundwater banking by adding “for recharge and infiltration.” It adds to promotion of water conservation programs, “and *support of other projects and programs* that intend to increase the water resources available to the County and reduce the individual demands of urban and agricultural users.”

117-814

**How shall the County “encourage, support, and require”** identification and development of additional water sources? Who would do the identifying and development? Does the County own any water sources, water storage reservoirs, or groundwater banking areas? To what extent can the County “require” identification and development of additional water sources? Can the County require water conservation, reuse, and recycling? Can it require groundwater banking for recharge and infiltration? If so, is it already doing so? If not, why not?

**How will the County “promote”** water conservation programs? How much control does the County have of water development, water use, and water conservation in the County Service Areas? The Matrix (p. 237, top) states that **surface water rights are 100% allocated in our County. Are any of the surface water rights allocated to the County, or otherwise controlled by the County?** Does the County have any groundwater rights? Is the County doing any groundwater banking? **This information should be discussed in the Background Report and the RDEIR.**

117-815

The RDEIR mentions, for example, that “Considerable planning is underway relative to development proposals along the Highway 99 corridor in the Deer Creek/White River watershed. The maintenance of the groundwater reservoir through this area is dependent on the continued capability to have surface water sources available for delivery into the area. Natural recharge of the groundwater reservoirs underlying the communities of Earlimart and Pixley is insufficient to sustain the agricultural plantings in the area and the community water systems.” **How does WR-3.1 apply to this situation, and others like it in the County?**

117-816

Two IMs are now listed for this Policy. **#10 (p. 11-13)**, shown as “ongoing” says the County will incorporate provisions, including evaluating incentives, for the use of water conservation techniques into the building, zoning, and subdivision ordinances. Has this already been done? Have the incentives been evaluated? This information should be provided in the Background Report and RDEIR. **IM#17** is the good old amend the well ordinance to require deeper seals. How does this relate to developing additional water sources?

117-817

**Please make this Policy clear and enforceable and provide trackable Implementation Measures.**

**WR-3.2 “Develop an Integrated Regional Water Master Plan” (p. 11—9-5):** Strong leadership is needed in this key area, immediately and in the long run, but this Policy has been considerably watered down from the 2008 version. No longer will the County “*take the lead* with other agencies and organizations.” Now the County will only “participate.” The scope of activities to be “enhanced” has been positively expanded (with the addition of

117-818

“data collection, reporting and public outreach efforts”), but no longer are the efforts to “ensure that an integrated regional water master plan and implementation program for the entire County is developed and maintained.” Now the efforts are only “to support the development and implementation of appropriate Integrated Water Management Plans within the County.” Why has this change been made?

I17-818  
cont'd

The Implementation Measures listed are now #3 (p. 11-12), “assure that all watershed planning is done on a complete regional and watershed basis” (ongoing); #17 (p. 11-14), the astonishingly versatile well seals amendment; and #18( p. 11-9), which says only that the County “will participate” in IRWM Plans (2010-2015) –this IM in 2008 said that the County “will take steps” To prepare and maintain an IRWMP. So now we have a Policy to participate implemented by a measure to participate. The Background Report and RDEIR should explain the County’s role in the IRWMP process and explain the purpose and importance of the process to Tulare County. Given that Tulare County is facing a water supply crisis and is one of the poorest counties in California, and given that State funding for water resource research and development is likely to be channeled via IRWMPs, why isn’t the County taking the lead in this process?

I17-819

**WR-3.3 “Adequate Water Availability” (p. 11-9):** This new policy (required by legislation) is obviously necessary, given our many communities in “Can’t Serve” status; no development whatsoever should be allowed without prior evidence of adequate and sustainable water supplies. Doesn’t the law require such proof only for subdivisions over 500 units (or equivalents)? Neither WR-3.3 nor its IM #19 (p. 11-14) indicates any number of units. Please clarify whether this policy will be applied to all new development proposals, regardless of size. (Appendix C to the Background Report, p. C-25, notes that the cities of Visalia and Tulare are extending the intent of the legislation to all levels of development, along with overdraft mitigation requirements.)

I17-820

Why has IM# 19 been reworted from the 2008 version in a manner that appears to definitely weaken it? The second sentence in the 2008 version said that “the new ordinance shall *eliminate current waiver provisions* and *require well pump tests* to demonstrate water supply capabilities.” The new version says “the new ordinance shall *evaluate* current waiver provisions and *evaluate* well pump tests requirements.” The 2008 GPR scheduled this ordinance for adoption by 2010. Now this critical ordinance is scheduled for 2010-2015. Please give it a higher priority, given our impending water crisis, and please restore the requirement to eliminate waiver provisions and to require well pump tests.

I17-821

This Policy does not, but should, also address the potential impact of proposed new water use on the adequacy and sustainability of water supplies to adjoining or nearby areas. The well pump test must also be evaluated for impacts to neighboring existing wells and water supplies. If a new development goes in and reduces the output of the pre-existing well on the next parcel, or pulls the groundwater table so low that the pre-existing well no longer can reach it, mitigation or restitution should be required for such an adverse impact if it actually occurs. Please include a requirement for such mitigation as part of this Policy.

I17-822

179

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

**PFS-2.3 “Well Testing,”** p. 14-6 states that new development must “be accompanied by evidence that the site can produce needed water without impacting the ability of existing wells to meet their needs.” However, it does not describe the evidence, it doesn’t state when the evidence must be provided, it doesn’t have an Implementation Measure, it doesn’t say when the policy will be implemented, and it doesn’t mention any recourse or restitution for users of existing wells who actually do suffer adverse impacts from the water production of the new development

117-823

**WR-3.4 “Water Resource Planning”** (p. 11-9): How can “continue” be a New Policy (“continue” implies an ongoing activity, unless the implication is that the County was going to stop participating)?

117-824

**Implementation Measures for this Policy** are #17 – the ubiquitous deeper well seals; #18, the County’s participation in IRWMPs – both on p. 11-14; and #20, p. 11-15, that the County shall “consider expanding the duties of the Water Commission.” “Considering” something does NOT constitute an Implementation Measure. Please provide a clear Policy and a concrete, measurable IM for this essential goal of water resource planning.

**WR-3.5 “Use of Native and Drought Tolerant Landscaping”** (p. 11-9): If, legally, the County can do more than “encourage,” please change the language of this weak Policy, to “require.”

117-825

**IM #10** (p. 11-13) states that the County shall incorporate provisions for the use of reclaimed wastewater, water conserving appliances, and drought tolerant landscaping, and other water conservation techniques into its building, zoning, and subdivision ordinances. The timeline is “Ongoing.” Are these provisions mandatory, or do they also only “encourage?” Is the County requiring all of these measures to be implemented in its own buildings and operations?

117-826

**IM #21** (p. 11-15) states that the County’s water efficient landscape ordinance will be consistent with the DWR Model Water Efficient Landscape Ordinance. The DWR’s ordinance should be stronger and is currently being revised. **The County should adopt the revised measures of the DWR ordinance, as a minimum, immediately** (isn’t adoption mandatory in 2010?).

117-827

**IM#21** (p. 11-15) says the County shall maintain and implement its landscape ordinance consistent with the DWR Model Ordinance (timeline 2010-2015). But **the County should adopt and enforce measures stronger than those in the Model Ordinance, since almost all of our population lives in the desert Valley (Visalia averages about 10” of rain per year), and our water situation is much more dire than that of many of the State’s counties. The County should require all development to install a very high percentage (say, at least 80%) of landscaping materials that are native and drought tolerant. Strictly limit grass lawn areas to a very small percentage (say 5% -- lawn grass is the number one crop in American) of landscaping (grass lawns should be only in recreational areas where they will be actually used, NOT in street borders or along walls or in yards in general; about 60% of domestic use is for outside the home, mostly for watering landscaping) , and require regular mulching of all other landscaping.**

117-828

180

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

Require intelligent irrigation monitors with weather sensors, and allow irrigation only at night. All irrigation should be micro-drip, regularly inspected; run-off or overspray should be prohibited.	I17-828 cont'd
<b>WR-3.6</b> in the 2008 GPR was “Agricultural Irrigation Efficiency” (p. 11-5). It required the County to support educational programs targeted at reducing water consumption on agricultural lands and enhancing groundwater recharge.: <b>Why has this Policy been deleted from the current GPR?</b> Is the County no longer intending to make any effort to address responsible water use on agricultural lands and enhancing groundwater recharge? <b>Please restore this Policy to the GPR</b> and state in it how the County will “support” these educational programs? Financially? Through regulations? <b>Please clarify this Policy and provide it with a concrete, measurable IM.</b>	I17-829
NOTE that IM #23 (p. 11-15 in the current GPR) pertains to an education program for “residents” regarding water conservation; it references WR-3.8 as its Policy. Could this IM apply to the Agricultural Irrigation Efficiency Policy as well, or are “residents” being differentiated from “agricultural” users? <b>Please clarify, and ensure that there is an IM at least equal to #23 for the restored and improved WR-3.6, because <u>agricultural uses account for by far the greatest percentage of the County’s water use</u> (doesn’t agriculture use 85 -90% of the total?).</b>	I17-830
<b>WR-3.6 Water Use Efficiency</b> (p. 11-9) has replaced the previous WR-3.6 in the 2010 GPR. This revised version no longer mentions agricultural lands, but otherwise reads the same, and has IM#10 (p. 11-13, already discussed above) and IM#23 (p. 11-15), which says the County will develop an education program to inform residents of water conservation techniques and the importance of water quality and adequate water supplies. This program was to be developed by 2010 in the 2008 GPR. Now it’s scheduled for 2010-2015. <b>Information about water conservation is important. Requirements for water conservation are more important.</b>	I17-831
The Tully and Young Phase I Water Supply Evaluation prepared in June, 2009, and included in the RDEIR as Appendix G describes the County’s enormous groundwater overdraft and its huge reliance on imported water, runs through a bunch of hypotheses and calculations, and concludes that <b>the General Plan buildout won’t change things much regarding the County’s water use and water supply.</b> Except that we might experience more subsidence, which might affect our ability and capacity to store <b>water underground (the source of almost all our urban water; barely mentioned is the effect of subsidence on wells, canals, and pipelines).</b> And that since urban development uses less water than average irrigated cropland (even though it eliminates groundwater recharge areas, increases runoff and flooding, and creates loads of wastewater), we won’t really have any net increase in demand.	I17-832
Footnote #5 (Appendix G, p. 6) notes that “Importantly, farmland categories do not include confined animal agriculture, which Department of Conservation treats separately.” Confined animal agriculture plays a huge and increasing role in Tulare County’s economy. <b>The RDEIR and the Background Report must be revised to include a comprehensive description and evaluation of this sector of County agriculture in terms of its demand on water supplies and its impacts on water supplies (e.g., nitrate contamination); the reader cannot be</b>	I17-833

properly informed without this information. **Where is this information factored into the calculations in Appendix G? Where does Appendix G evaluate groundwater contamination extent?**

I17-833  
cont'd

**It should also be noted that the County appears to be determined to allow major New Town development to occur in the foothills, where significant groundwater supplies are scattered and uncertain. This development would not “use less” than water currently being used for irrigated agriculture, since almost none of foothill agriculture is irrigated, but would instead require extensive conveyance of water from other sources into the foothills, meanwhile disrupting and degrading the foothill watershed. Where does Appendix G discuss the impact of this type of development on the projected water supply? This information must also be presented in the RDEIR and the Background Report.**

I17-834

**Appendix G leaves the reader with the impression that all will be well at buildout of the GPU because we’ll only be using about the same quantity of water that we are today. It doesn’t address whether there’s any way to evaluate whether we’ll have any groundwater left by then, Could 20 more years of overdrafting (currently 41%-- among the highest in the State -- of our water budget) exhaust or destroy our groundwater supply? It says that Tulare County’s farmers have already implemented most of the cost-effective opportunities for irrigation efficiencies, and so projects only a 5% demand reduction as possible for agriculture (versus a possible 10% for urban uses). It does not discuss what efficiency measures have been implemented nor does it discuss agricultural water uses for other than irrigation (e.g. dairies).**

I17-835

**Appendix G touches on the impacts of climate change on pp. 29-30, but does not state how or if it has made any attempt to quantify and project these impacts in its forecast of the GPU buildout conditions (nor does it discuss the impacts of increased pumping and conveyance of water on GHG emissions and climate change). Tulare County’s snowpack has already been decreasing, on average, over the last 50 years, and its runoff is already coming earlier, and its recharge patterns are already changing, and its groundwater is already declining. These changes are occurring not just in Tulare County, but in the other counties on which Tulare County depends for its imported water supply, which will almost certainly jeopardize and reduce the availability of water that our County can import. The RDEIR and Background Report must analyze and evaluate these impacts and should make the best attempt possible to look at all the factors that must be considered and present what could likely be the worst case scenario, so that the GPU can take that into account in its land use and development Policies and Implementation Measures.**

I17-836

**Many other questions arise from a reading of Appendix G (e.g., why does it use the City of Fresno’s Urban Water Management Plan [p. 9] for land-use mix when Fresno is not in Tulare County and is not typical of any urban area in Tulare County, how statistically and analytically valid is its selection of single year [2003, p.2] as an “average year” and using that for its analysis and projections, etc., etc.). The GPU/RDEIR documents must be extensively revised in order to fulfill their responsibility to provide the information necessary to effective understanding and decision-making with regard to water resources and the GPU.**

I17-837

182

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

<p><b>WR-3.7 “Emergency Water Conservation Plan” (p. 11-9):</b> What are the County operated water systems mentioned in this Policy? This New Policy indicates that the County does not yet have such a plan, but the <b>Implementation Measure (#22, p. 11-15)</b> seems to imply that the plan already exists (since the timeline is “Ongoing”), and that a priority of consumptive uses is to be developed for it. <b>Please clarify:</b> Does the Plan already exist? When will the priority of uses be developed (without a date, this IM cannot be measured)?</p>	<p>I17-838</p>
<p><b>WR-3.8 “Educational Programs” (p. 11-10):</b> How will the County “encourage” the development of these important programs by water purveyors and public agencies?</p> <p><b>IM (#23, p. 11-15)</b> states that the County itself “shall develop an education program.” Does this mean that the County will develop the program by encouraging others to develop it? <b>Please clarify.</b> Also, please explain how this Policy differs from WR-3.6 (p. 11-9); they both have the same Implementation Measures (#10 and #23)..</p>	<p>I17-839</p>
<p><b>WR-3.9 “Establish Critical Water Supply Areas” (p. 11-10):</b> How will the County designate these areas? Don’t almost all of the urbanized areas in the County (and over 95% of the County’s residents) rely almost totally on groundwater for their water supplies? Are some of these groundwater basins interconnected? Are some of them dependent on the same groundwater recharge areas? Are many of the recharge areas being paved over by urbanization and infrastructure? Does the County already have this information? Once the Critical Water Supply Areas are designated, then what? <b>The Critical Water Supply Areas should be discussed in the RDEIR and the Background Report, along with the County’s measures to protect them and their effectiveness.</b> Five IMs are listed for this Policy:</p>	<p>I17-840</p>
<p><b>IM#17 (p. 11-14)</b> is the ever-ready deeper well seals ordinance amendment.<b>IM #24 (p. 11-15--10)</b> lists many good protection practices, which should be applied as universally as possible in the County, due to its water emergency. This is shown as “ongoing.” Are these regulations already in place and being enforced? If so, where are they? Are they County ordinances? State or federal law?</p>	<p>I17-841</p>
<p>Is <b>IM #25 (p. 11-15)</b> , amending County ordinances over the next five years (formerly by 2010) to protect groundwater basins and surface drainage areas, the method by which IM #24 will be implemented?</p>	<p>I17-842</p>
<p>Is <b>IM #26 (p. 11-15), establishing the development of design standards</b> over the next five years (formerly by 2010) basically the same as IM #25? <b>IM #24</b> says “regulating,” <b>IM #25</b> says “amend County ordinances to include development standards,” and <b>IM #26</b> says the County shall establish development or design standards.” <b>These appear to be redundant. Please clarify.</b></p>	<p>I17-843</p>
<p><b>IM #27 (p. 11-15)</b> has been <b>significantly changed from the 2008 version</b>, which said that the County “shall <i>identify a system of critical water supply</i>, water transfer and groundwater recharge areas on a map.” The current version states that the County “shall identify a system of <i>critically inadequate water supply</i>,</p>	<p>I17-844</p>

<p>water transfer facilities, and groundwater recharge areas on a map.” The timeline for identifying the areas on a map has been delayed from sometime between 2010 and 2015 to 2015 to 2020. The rewording indicates that the County, five to ten years from now, is <i>not</i> any longer going to “draft an ordinance relating to the care and maintenance” of all of our critical water supply and transfer and recharge areas, but <b>ONLY</b> of those parts of the system that are “critically inadequate,” which by then will probably be more extensive than they are now. Given the County’s impending water crisis, <b>please move this timeline up to 2012 at the latest. How much development is the County likely to approve in the interim, by 2020, without the benefit of IMs #24, 25, and 26, which have timelines of ongoing and 2010-2015? How can these IMs be implemented before the critical water supply areas are mapped (the map isn’t due until 2015-2020)?</b> Who are the stakeholders referred to in IM #27? Will the proposed ordinance in IM #27 use terms such as “encourage,” and “discourage” as indicated, making compliance with “care and maintenance” of the “critically inadequate” facilities and areas optional?</p>	<p>I17-844 cont'd</p>
<p><b>These issues need to be discussed in the RDEIR and Background Report.</b> Doesn’t the County already know where the critical water supply, water transfer and groundwater recharge areas are? Why is the County no longer planning to address all of these? Can’t it already map them, using GIS? How will it identify the “critically inadequate” supply, transfer, and recharge components? What are some examples of these? <b>Why can’t they be identified now on a map, and an ordinance drafted now, so that we can start dealing with them now, before they become totally inadequate?</b> With full disclosure in the GPU/RDEIR documents of this situation, the public and decision-makers will be better able to determine how high a priority this implementation measure should be.</p>	<p>I17-845</p>
<p><b>WR-3.10 “Diversion of Surface Water” (p. 11-6):</b> This sounds like a good policy, but it has been changed from “shall be prevented” (in the 2008 version) to “should be prevented” in the current version. “Should” is not a Policy; <b>please restore the “shall.” Implementation Measure #6 (p. 11-12)</b> is now indicated as the IM for this Policy, but it is written to apply only to “destruction of <i>established recharge sites</i>.” Where are those sites? Are they the ones that were going to be identified on a map via IM#27, but are no longer going to be addressed unless they are “critically inadequate?” <b>Please clarify and provide a concrete IM</b></p>	<p>I17-846</p>
<p><b>WR-3.11 Policy Impacts to Water Resources (p. 11-10):</b> Once the County has evaluated the effects of federal and State level actions on County water resources, what will it do?</p>	<p>I17-847</p>
<p><b>11.4 Acronyms – DBCP</b> is stated to be the acronym for Chemical Decachlorobiphenyl; isn’t DBCP dibromochloropropane? [The Acronyms section is now gone from the Water Resources Chapter.]</p>	<p>I17-848</p>
<p><b>WATER RESOURCES, Section 10.2, BACKGROUND REPORT (BR p. 10-1 ff):</b></p>	<p>I17-849</p>

**NOTE that the RDEIR basically repeats the information in the Background Report, so these comments apply equally to the RDEIR and should be read as such.**

I17-849  
cont'd

**BR p. 10-5** refers to AB 3030 (Water Code Section 10750 et seq.), which authorizes local agencies to adopt **groundwater management plans** and to impose assessments to finance the cost of implementing the plans, and states that about 150 local agencies have adopted such plans. The County's groundwater is being contaminated, hugely overdrafted, and more and more obstructed from recharge. Why doesn't the County adopt a groundwater management plan? Several policies and IMs relating to groundwater are presented in the GPR, but a groundwater management plan isn't mentioned. Wouldn't it be more effective to coordinate, fund, and implement these policies through a comprehensive groundwater management plan?

I17-850

**BR p. 10-6** states that over 30% of the state's runoff is not explicitly designated for urban, agricultural, or environmental uses and so is "depleted from the hydrologic system as outflow to the Pacific or other salt sinks." This implies that this water is somehow wasted, as if it is not essential, for maintenance of the hydrologic system and the ecosystems that it supports, for outflow to reach the Pacific. In the long run, we are utterly dependent on the proper functioning of earth's hydrologic systems, and the great natural resources of the Bay Delta and our coasts (not to mention those of our rivers, wetlands, streams, etc.) are already being severely taxed, and in too many cases destroyed, by our interference with the state's hydrologic system. **Please revise this paragraph accordingly.**

I17-851

**BR p. 10-13** states that Tulare County water supplies are 37% local, 31% imported and 32% groundwater (but the GPR on p. 11-3 says that there are four major sources: groundwater, local streams and rivers, imported surface water, and imported surface water by exchange). It says nothing about the likely effects on County water supplies of global climate change or of pending settlement of litigation regarding imported water. It says nothing about the long-term effects of our huge overdrafting of County groundwater. It states that we use nearly 1/3 of the water for agriculture in the entire state, but that our agricultural water use should decline as land is removed from agriculture use through urbanization and retirement of lands in areas of poor soils and drainage (it gives no estimate of what amount of reduction in agricultural demand might occur over what amount of time). Of each of the sources of supply (local, imported, and groundwater), what percentage goes to agricultural use and what percentage to domestic use? What is the likely reduction projected for agricultural use? Doesn't our domestic supply presently come almost entirely from our declining (and increasingly contaminated) groundwater supply? Will all our sources of supply likely be reduced by the impacts of global warming/climate change?

I17-852

**BR pp. 3-90 and 3-91** discuss some of the County's water contamination problems, including fertilizers and pesticides that can increase salinity and toxicity, large amounts of irrigation water increasing salinity (and

I17-853

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

185

overdrafting), and nitrate and arsenic contamination (which have caused numerous County wells to be taken out of service and jeopardized many communities' water supply and capacity for growth). **It does not address whether these contaminants can be removed from water supplies, and, if so, what the costs would be.** The only Implementation Measure even peripherally addressing this issue is #11 (GPR p. 11-13), which says only that the County "shall identify and evaluate conditions within established watersheds which are causing deterioration of the water quality, water supply, or declining water yields. The County shall institute the necessary revisions to regulatory documents . . . to mitigate these issues." **But what about the water sources that are already too contaminated to use?**

I17-853  
cont'd

**Correctories dated January 25 and February 26, 2008,** were issued to correct and supplement the Background Report dated December 2007. The first correctory includes "Appendix C- Water Resources, Revised July 2007." This now appears as **Appendix C to the Background Report** (no revision date).

I17-854

**Average Groundwater Elevations:** Page C-3 of BR Appendix C states that Figure 4-8 (which was not provided with this correctory, but was then issued in the second correctory, dated February 26) is **presented as "an indication of the type of information which is available for the cities and communities located within the County."** Figure 4-8 shows that from 1986 to 2005 the average static elevation of groundwater at the City of Visalia has declined from about 50 feet to about 100 feet, and the **average pumping elevation has declined from about 85 feet to about 135 feet (with a recent drop to below 140 feet).** The text on page C-3 explains that "Typical of all communities with groundwater as the principal source of supply, conversion of land from agricultural use to urban use" **has changed the source of supply from conjunctive use of surface and groundwater to exclusively groundwater, resulting in a decline in the volume of water available in the groundwater reservoir and an increase in the distance from which that groundwater needs to be mined."** Since virtually all of Tulare County's urbanized areas depend almost entirely on groundwater for their supplies, and since virtually all of them are located on agricultural land being converted to urban use, **then are all of them, like Visalia, experiencing substantial increases in their depth to groundwater and average pumping elevation? If this information is available for the County's communities, then the GPU/RDEIR documents, to adequately inform the public and decision-makers about what is happening to the County's groundwater supply, must provide it.**

I17-855

**What are the impacts of this increasing depth?** How much more does it cost to bring water up from 50 feet deeper? How much more energy is required, and how much more pollution does that cause, and how much does that increase GHG impacts on global warming? Do we know the maximum depth of the groundwater basin? Can we calculate what a 50 foot drop means as a percentage of the available supply? Do we have a way to calculate the reduction in groundwater? **GPU/RDEIR documents must make a good faith effort to address these critical issues and their cumulative direct and indirect impacts.**

I17-856

For what period of time have these Average Groundwater Elevation data been recorded? Is the change shown in Figure 4-8 typical of the pattern over the entire time for which records are available? Page C-10 indicates that the declining groundwater has also affected agriculture: "Depth to groundwater impacts and associated cost impacts related [to] energy consumption are further contributing to this shift in cropping patterns." How much is this higher energy consumption impacting GHG emissions? And, of course, the impacts of global climate change will almost certainly cause further pumping increases, in a long cycle.

**Please provide County-wide information in text and graphic form in the GPU/RDEIR regarding this fundamental issue.**

I17-856  
cont'd

**Radiological Test Results:** Page C-4 of BR Appendix C mentions that "Attention is paid, on a continuous basis, as with any foothill or mountain system, to radiological test results." Please explain why these test results are important. Does this imply a public health and safety issue in the foothill development corridors and the proposed New Town of 30,000 residents, Yokohl Ranch, and in the Mountain Service Centers? Is it a factor to be considered in projecting growth and development? There is some discussion of the water supplies for 5 of the communities in the foothills and mountains, but no discussion of whether they are at or near capacity, or what amount of population growth they could surely accommodate on the basis of their supplies, nor any discussion of what population growth is projected for these communities under GPU buildout.

I17-857

The GPU/RDEIR must be revised to provide a much clearer picture of where the County proposes to direct growth in the unincorporated areas and what the reliable capacity of those areas is in terms of water supply to accommodate that amount of growth through the life of these urbanizing areas. A reliable, clean water supply is a chief priority of the people of Tulare County, and the GPU/RDEIR must thoroughly and honestly provide information on this essential subject, for all areas being designated for growth, sufficient to enable confident and responsible planning with full consideration of the environmental impacts of these decisions and how the impacts can be avoided or meaningfully mitigated..

I17-858

**Kings River Watershed:** Pages C-6 and C-7 of BR Appendix C state that groundwater is declining in this watershed also, increasing the demand for surface water (with an almost 2:1 ratio of surface water requested between contract supply and anticipated firm yield in the Hills Valley I.D.) The groundwater management plans in this watershed encourage groundwater recharge policies to abate the decline in the amount of water in storage and static levels. Are these recharge activities producing a positive effect? To what degree can managed recharge activities alleviate declining groundwater supplies? Can these activities suffice to offset the effects of increasing urbanization (and increased water-intensive agriculture) on groundwater? Page C-7 indicates that there is already an almost 2:1 ratio of surface water requested by landowners within the Hills Valley I.D. between contract supply and anticipated firm yield, and that withdrawals in excess of safe yield increase with distance from the foothills, with declining groundwater.

I17-859

**Water Quality:** Page C-7 in BR Appendix C describes man-induced contamination problems from fertilizers, pesticides, and herbicides (many of which have been banned, but continue to have residual effects), often caused by improper application of these chemicals, and states that every community in the Kings River Watershed is impacted by water contamination. Page C-8 states that the Alta Irrigation District has entered into an MOU with the Cutler PUD and the Orosi PUD to evaluate the technical and economic feasibility of a surface water treatment plant that would use water from the Kings River supplies of the Alta I.D., introduced into the Friant-Kern Canal by exchange, to provide water to East Orosi, Orosi-Cutler, Sultana, and Dinuba to resolve their groundwater quality issues. What would be the likely timeframe for this surface water solution? Where would the money come from? How reliable is the surface supply? What are the impacts of this situation on future development in the Kings River watershed portion of Tulare County? The Background Report/RDEIR must substantively discuss these issues in order to properly inform the reader.

I17-860

**Kaweah River Watershed:** Page C-8 of BR Appendix C states that the City of Visalia exchanges its CVP Cross Valley contractual water supply with the Hills Valley I.D., with the City making use of Kaweah River supplies held by a grower within the Hills Valley I.D. Page C-11 says that this exchange arrangement allows the City to hold its water in trust until a determination is made as to its future disposition. Is this a description of water banking? Please explain these facts in the GPU/RDEIR in terms of their significance to an understanding of the County's water resources and the GPU. Is Visalia's arrangement a typical one? Does it affect reliability of water supply or ability to accommodate growth? Who makes the decision regarding the future disposition of the trust water, and what are the options for its use? Is this a good example for other urbanized areas to follow?

I17-861

**TABLE II: CVP Contract Quantities Kaweah River Watershed (p. C-9, BR Appendix C):** The facts in this Table are presented without comment or explication. Are the five entities listed the only recipients of CVP water in the Kaweah watershed? Can the Irrigation Districts use their water for any purpose they choose to (e.g., do they have to use it exclusively for irrigation, or can they trade or transfer or sell it to other entities – inside or outside of the County, or could it be used to support residential or other types of development)? Only about 1/3 of Exeter I.D.'s contract quantity is Class I water, only about half of Ivanhoe I.D.'s is Class I, and only about 1/3 of Tulare I.D.'s is Class I, so the great majority of this water is Class II and therefore uncertain. Does this mean that as groundwater continues to decline and as global warming increasingly affects our area, there is also likely to be less CVP water available to take the pressure off groundwater supplies and to recharge groundwater? Please inform the readers of the GPU/RDEIR: what are the implications of this for land use planning, intensive agricultural uses, and projected population growth?

I17-862

**Groundwater Trends:** Page C-10 of BR Appendix C states that the Kaweah Delta Water Conservation District (KDWCD) recently found that "the overall underground reservoir" was being overdrafted at 17,999 to 36,000

I17-863

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

188

acre-feet per year. Is there only one underground reservoir in Tulare County? Are the locations, dimensions, and relationships among the underground reservoirs in our area known? The “static groundwater trend is ever decreasing, as is the corresponding quantity of water being held in storage in the groundwater reservoir” per Visalia’s information. SWP water has “helped to abate the more serious decline in groundwater levels in eastern Kings County and to “abate the outflow of water from lands within Tulare County to lands within Kings County.” This implies that Tulare and Kings counties share at least one underground reservoir. **Please provide in the GPU/RDEIR a graphic overview of what is known about these underground reservoirs. Have some of them already been sucked dry? Do we know whether others are close to exhaustion?**

I17-863  
cont'd

The February 26, 2008, correctory provides “Figure 4-7 – Groundwater Elevation Contours from Kaweah and Tule Groundwater Basin Maps for Spring 2004. Lines of Equal Elevation of Water in Wells, Unconfined Aquifers published by California Department of Water Resources.” . Why is this snapshot view of groundwater elevation contours offered? Was the map for Spring, 2004, selected because it is significant for some reason? For how many different years of data have these maps been produced? Would comparing them increase our understanding of the groundwater situation and groundwater trends? Page C-3 of Appendix C states that “the purpose of the figure is to indicate the type of information which is available from public sources such as the State Department of Resources.”

I17-864

**Please interpret this Figure and put it in context. Like so much of what is presented in the Background Report/RDEIR related to water (and most of the other topics discussed), this information seems fragmentary, random, unexplained, and unrelated to the other information presented. This does not allow the public and decision-makers to gain a useful understanding of the County’s water situation. Please revise the GPU/RDEIR to correct this problem.**

Page C-10 of BR Appendix C states that Kaweah River Watershed is contaminated in various locations with DBCP, herbicides, pesticides, fertilizers, dry cleaning solvents, and petroleum fuels. It states that **some purveyors have installed surface water treatment facilities on selected water extraction facilities, but it does not describe the location, cost, volume, or efficacy of these treatment facilities.** It states that **the principal method for dealing with contaminant-related issues is to shift to another area where water quality problems are absent,** but it does not discuss the relative costs or the sustainability of this approach.

I17-865

It states that “**petroleum hydrocarbon contamination is an on-going process which has further impacted the availability of groundwater for consumptive purposes in numerous locations,**” but it does not state the source of this contaminant, where these locations are, or whether the hydrocarbon contamination is irremediable. **How do these contamination issues affect land use planning and future growth and development? Can the contaminated water be used for purposes other than human consumption (e.g., for irrigation or for industrial use)? These critical**

189

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

issues must be discussed in the GPU/RDEIR in a manner that makes them relevant to the land use and planning functions of the GPU.

I17-865  
cont'd

**Deer Creek/White River Watershed (p. C-14 ff, BR Appendix C):** With the lowest elevation watershed in the County, this area has the highest dependency on imported surface water (CVP Friant Division contracts designed to abate overdraft and groundwater decline) for viability of its permanent crops and increasing number of dairies and their support lands; increasing water costs have significantly reduced its cotton acreage. Ironically, in very wet years, this area (e.g., Earlimart and Hwy. 99) is subject to flooding. **The GPURDEIR documents must discuss how these factors affect land use planning and future growth and development for urbanized areas in this watershed.**

I17-866

**TABLE III: CVP Contract Quantities – Tulare [this should be corrected to Tule] River Watershed (BR p. C-13)** shows a great reliance in this watershed also on Class 2 water. The text below states that the Tule River Watershed **has the highest population impacted by lower quality groundwater** (contaminated with nitrates, chlorides, and DBCP) in the County, with the City of Lindsay, the Lindsay-Strathmore I.D. (serving the Tonyville and Strathmore areas), and the Strathmore PUD having had to construct and operate **surface water treatment plants to treat water from the Friant-Kern Canal**. Nitrate contamination in east Porterville and Plainview necessitated **extensions of pipelines** from the City of Porterville into the unincorporated area, while the Sunnyside School extended a pipeline from the Strathmore water treatment plant. Plainview's problem remains to be solved, while proposed **changes in water quality parameters for radon and arsenic could put other systems out of compliance** with state and federal drinking water criteria. The County's efforts to implement an improved **program for destruction of abandoned wells** is mentioned (page C-14), but **where is a related Policy or Implementation Measure** in the Water Resources Element of the GPR?  
**The GPU/DEIR must discuss the environmental ramifications of these issues, and how they affect land use planning and growth and development in this watershed through buildout of the project.**

I17-867

**Project Development Considerations (p. C-11, BR Appendix C):** The City of Visalia's land-based charge to develop groundwater management programs, purchase surface water for recharge, and purchase water rights for delivery into areas impacting the groundwater reservoir underneath the City is mentioned, along with the City's land-based charge on lands being converted from agricultural to urban uses to address the shift of water supply from conjunctive use to exclusive groundwater. **It is not stated when this program started or whether it has been determined to have a positive effect. If so, could other Tulare County communities adopt such a system for their own urban needs?** Again, the facts presented in the GPU/RDEIR must be made relevant to the essential planning and land use information that must be conveyed by these documents.

I17-868

Development along the Hwy. 65 corridor has **severely overdrafted the groundwater, causing adverse water availability and quality conditions**. Efforts to recharge groundwater basins are underway, but **no results are**

I17-869

190

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

indicated. Page C-17 indicates that the **Mid-Valley Canal program is inactive due to lack of available supply for long-term contracting** and that Friant Division CVP water is being used primarily to try to reduce groundwater declines.

Again, this information must be specifically related by the GPU/RDEIR documents to the GPU project plan, impacts, and alternatives.

I17-869  
cont'd

**Groundwater Quality (p. C-18, BR Appendix C):** South of Terra Bella, specially designed wells are being used to select water from only identified aquifers in order to meet drinking water standards, but available quantities are limited because “taking water from too shallow of a zone, or from too deep a zone, results in significant diminishment of the quality to be delivered.” **What are the implications of this for land use planning and the future of agricultural development and population growth in this area; please discuss appropriately in the GPU/RDEIR.**

I17-870

**Page C-19 (BR Appendix C)** states that “natural recharge of the groundwater reservoirs underlying the communities of Earlimart and Pixley is insufficient to sustain the agricultural plantings in the area and the community water systems” especially since additional plantings near the communities are predominantly permanent in nature (as compared to annual crops), and community demands are growing, while delivery of Friant Division CVP water supplies on which the communities depend may be impacted by litigation. **“The development of a response plan to address reduction of surface water deliveries . . . remains to be developed.”**

**The RDEIR states that Pixley’s water system can’t meet fire flows, has major arsenic problems, and lacks capacity to serve projected growth, with significant difficulties likely in expanding to meet projected demand.** The GPU/RDEIR must discuss how this information about these communities’ water supplies is affecting planning and land use decisions for these areas.

I17-871

**Page C-22 (BR Appendix C)** states that for the area along the Hwy. 99 axis, **“Absent the imported CVP supplies, groundwater depths would reach levels where current commodity returns would not allow for economic recovery.”** Table IV on p. C-16 indicates that about 40% of the Delano-Earlimart I.D.’s CVP water is Class 2.

I17-872

**How will the Friant-Kern litigation settlement impact the potential for growth and development in this area? Even if Class 2 water remains available to this area, how much additional growth and development can it support?** This area used to have artesian water. Earlimart (per Background Report, p. 7-17) now has 600 foot deep wells, pumping at a water level of 250 feet, and the water system is operating at approximately 88% of capacity. **How far down is it to groundwater in the other communities in this corridor? How rapidly is the groundwater level falling?**

I17-873

What are the likely impacts of accelerating global climate change on the availability of imported water, and what are the likely impacts of the energy use and emissions of continually greater pumping on global warming? 117-874

How will the County's declining groundwater, increasing water quality problems, and decreasing imported water supplies affect its agricultural economy and its ability to provide reliable, clean water supplies to its every-growing population? 117-875

Per page C-22 (BR Appendix C), water quality on the westerly side of the Deer Creek/White River Watershed is unacceptable due to arsenic, microsand, and various gases (such as hydrogen sulfide, methane, and natural gas). Alpaugh is trying to determine whether an "affordable method of arsenic reduction" can be developed, and is in "Can't Serve" status. The GPU/DEIR must discuss these issues in relationship to projected growth and development in this area. 117-876

Surface Water Supplies (BR p. C-15): This section illustrates the precariousness of many of the County's communities' water supplies, stating that lands developed along the Highway 65 corridor were dependent originally on groundwater, but as this supply proved incapable of sustaining the development without severe overdraft conditions and adverse water quality conditions developing, 20-year contracts were entered into with the Federal Government for water supply from the Delta, in conjunction with construction of the Cross Valley Canal; now this supply is based on a series of interim renewal contracts. Longer term contracts are being negotiated. The GPU/RDEIR must discuss how this inability to support even existing development without depending on imported water affects planning and land use in the GPU. 117-877

Integrated Regional Water Management Plans (p. C-19 ff, BR Appendix C): The text indicates that IRWMPs are needed to acquire state funding, but the funding is hard to get, and Tulare County doesn't seem to be one of the State's priorities. A coordinated County-wide Plan would probably have more clout, but IM #18 (GPR p. 11-14) says only that the County "will participate in" Integrated Regional Water Management Plans. Appendix C (p. C-20) states that "The absence of any infusion of state bond money related to water resources into the county will significantly curtail both planning and implementation efforts as the county strives to deal with the demands imposed by increasing population on the available water resources." The GPU/RDEIR must specifically discuss what steps the County means to take and provide a definite deadline for completion of its IRWMP. The GPU/RDEIR must also specifically and concretely discuss the meaning and implications of the statement that without state water resources bond money, the County will have to curtail planning and implementation efforts. 117-878

Water Quality (p. C-20 ff, BR Appendix C): The text points out that the RWQCB is taking action to terminate the 20-year agricultural water quality waiver for the Central Valley, replacing the long-term waiver with a short-term 117-879

waiver and requiring water quality sampling, testing, and reporting at identified points on waterways, with the legislative push apparently favoring increased testing and reporting. Legislative and regulatory requirements are also tending to dictate decreasing quantities of allowable constituents and increased testing and reporting, with compliance sometimes entailing increased costs related to construction and operation of contaminant removal facilities.

I17-879  
cont'd

This section concludes that **"The planning efforts of the County should recognize the water quality implications related to [these contaminants, e.g., arsenic, DBCP, and nitrates] in planning for the maintenance of an expansion of cities and unincorporated communities . . ."** While the GPR has several policies regarding collecting water quality information and protecting water quality, it seems to have only one regarding contaminated water resources, **WR-2.6 "Degraded Water Resources" (GPR p. 11-8)**, which states that the County will "promote restoration where appropriate," but its only IM (#17, p. 11-14) has to do only with amending the well ordinance to require deeper seals in areas of known contaminants.. The difficulty and expense of removing the contaminants from water resources makes protecting the resources wherever possible from the introduction of these contaminants critically important. However, **as discussed above in the WR Element comments, virtually all the County's policies and implementation measures in this area are inadequate, vague and weak, and cannot be relied on.** The GPU/RDEIR must fully discuss the issue of water quality, one of the people's top priorities, and how it affects land use and planning in the GPU.

I17-880

**Appendix C of the Background Report concludes (p. C-22) that the San Joaquin River restoration litigation settlement could result in the loss to Tulare County of almost half the water it receives via the CVP Friant Division (over 450,000 acre-feet), which could "completely undermine the existing population projection "** (this has been reworded from 2008, which said "completely undermine the existing basis for Tulare County population, allocations and disposal.).

I17-881

**Please explain what the existing basis is for "population, allocations and disposal," and clarify what those terms mean.** It states that **"on the individual community maps, which are a part of the General Plan update,"** indication will be given **"as to the potential for impact if an adverse court ruling prevails"** by a box being checked; these maps will require **"future refinement"** when a final court decision is entered.

I17-882

**We could not find these maps with boxes and checks in the 2008 GPU documents. In the February 28, 2008, correctory, the statements regarding the community maps were eliminated.** Since the Tables in Appendix C indicate that many, if not most, of the County's irrigation districts and communities are receiving CVP Friant Division waters, and that many of them, including Exeter I.D., Ivanhoe I.D., Tulare I.D., Lindmore I.D., Lower Tule River I.D., Porterville I.D., Saucelito I.D., and Delano-Earlimart I.D. are heavily dependent on Class 2 water, it seems the litigation decision could have enormous impacts on land use, planning, and development in our county, so **why have these marked maps been left out?** They do not appear in the 2010 version.

There is also no mention of the litigation in the 2010 GPR's Water Resources Element, but there should be, given the tremendous impact it could have on the County's resources. | I17-883

BR Appendix A (Excerpts from Tulare County CEDS) of the January 25, 2008, correctory is dated June 2004. It lists 38 projects and their status, showing 5 underway, 1 in the design phase, 20 in the study phase, and 12 on hold. We asked that a brief update on the status of these projects be provided, since many of them seem related to the capacity of their communities to support growth. | I17-884

The 2010 version of Appendix A has no date at the top, but still discusses information with dates of 2003 and 2004. The entire Appendix should be updated and clarified. A number of the project descriptions have no dates at all. It is almost impossible for the reader to gain any clear understanding of what must be accomplished in these various communities to enable them to support future growth and development, what has actually been accomplished, what remains to be accomplished, what kind of timelines are typically involved in getting projects accomplished (planning, studies, designs, approvals, funding, contracting, and actual construction), how funding is acquired (much of it appears to come from grants and State funding, which, given the condition of the State budge, will probably become less available), and what the results have been in terms of improvements in local economies, environments, and quality of life. | I17-885

The maps in Appendix B (Background Report Exhibit 1-0 – 1-28) continue to show locations discussed nowhere else in the GPU/RDEIR (e.g., Alpine Village, Ponderosa, Patterson Tract, Tract 92), and the maps are not connected to the text. Each map should include a brief text summary of the existing conditions of the water and sewer systems for the area shown, the existing capacity, the growth and development projected for the area under the GPU, and what improvements, if any, will be required within the GPU horizon to accommodate and properly serve the projected growth. | I17-886

The GPU/RDEIR documents continue to be deficient and inadequate in presenting a clear, informative picture of the County's existing conditions, the changes proposed by the GP 2030 Update (including by each Alternative), the impacts of the GPU on the areas proposed for new growth and development, the ability of these areas to adequately accommodate the projected growth, and the environmental impacts of the project. The GPU/RDEIR also substantially fails to relate the information that it presents in any concrete way to the actual proposed project and its environmental impacts, and the Policies and Implementation Measures provided are almost entirely unable to serve as effective mitigating policies and implementation measures. (The GPU/RDEIR appears to make almost no effort to actually avoid creating additional significant environmental impacts, which is, of course, the CEQA preference. The GPU/RDEIR is not designed to confine projected growth to existing urbanized areas, nor to require new development to be optimally resource efficient, nor to meaningfully address GHG emissions, unnecessary VMTs, and substantial conservation of natural resources. | I17-887

For example, RDEIR Section 3.6 – Hydrology, Water Quality and Drainage (RDEIR p.3.6-1 ff), as is the practice throughout the RDEIR, begins by basically duplicating the information presented in the Background Report [so that comments on the Background Report are simultaneously comments on the RDEIR]. This information is presented in an arid, high-level, remote manner, that rarely relates the information to on-the-ground situations in the County as they will be impacted by the proposed project. This approach enables statements such as “it is anticipated that implementation of the proposed project would result in similar impacts to all geographic planning areas of the County” (RDEIR p. 3.6-36), which is absurd given the immense differences in the County’s water resources over its vast and varied geography. **The RDEIR never shows how much growth and development will be directed to which communities in which areas of the County (e.g., Valley (east, west, north, south), foothills, mountain service centers, so the reader cannot see where and to what degree factors such as floodplains, levees, fractured rock water supply, declining groundwater, groundwater contamination, imported surface water, etc. apply.**

I17-888

Sometimes, the RDEIR begins to vaguely alert the reader to the significance of its information. For example, on RDEIR p. 3.6-46, it states, “Effective implementation of groundwater management practices [is] necessary to meet future water demands via groundwater extraction, without creating declining groundwater levels, and adversely affecting existing wells. . . . At a minimum successful groundwater management should be defined as maintaining and maximizing long term reliability of the groundwater resource, focused on preventing significant depletion of groundwater in storage over the long term and preventing significant degradation quality.” “Due to the uncertainty of future groundwater management efforts combined with the current regulatory approach, insufficient future groundwater supplies may be experienced in the County. Consequently, even with implementation of the below mentioned policies, this impact is considered potentially significant”.(p. 3.6-47).

I17-889

The Policies and Mitigation Measures listed on p. 3.6-47 give the impression that the GPU/RDEIR is making a good faith effort to substantially address the impacts. (Indeed, in many cases, these lists are up to twice as long as the one here.) They are described in more detail on p. 3.6-45 and 3.6-46, soothing the reader with assurances that the County is actively working to effectively address these concerns (unless one notices that, throughout the RDEIR, far too many of them depend on undefined actions such as “encourage,” “consider,” “study”). However, and this is almost without exception the case, when one reads the actual Policies and IMs in the GPR (and the few new ones that appear in the RDEIR as additionally required), they are found to be largely vaporware: weak, vague, ineffective, not measurable, not enforceable, not timely (or with no specific timeline, or with timelines now moved out an additional number of years from the 2008 timelines), and sometimes not even understandable. Most of these Policies and Implementation Measures are discussed individually throughout these comments. Please refer to these individual discussions. **Almost none of Policies and Implementation Measures listed throughout the RDEIR can be relied on to serve as effective mitigating policies and implementation measures for purposes of CEQA and the RDEIR.**

I17-890

195

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

Time after time, as on p. 3.6-47, the RDEIR then concludes that “no additional feasible mitigation” is currently available. That certainly is not the case, however, since the mitigations (Policies and Implementation Measures) that have been listed are not designed to actually effectively implement effective policies. **First, the GPU/RDEIR Policies and Implementation Measures must be comprehensively revised to be made clear, strong, measurable, and enforceable.** Only after those revisions should the RDEIR surmise whether additional feasible mitigation is available.

I17-891

The GPU/RDEIR’s deficiencies and inadequacies were extensively discussed and illustrated in our 2008 comments and addressed by over 1000 pages from others as well. However, the current draft GPU/RDEIR has almost entirely failed to respond to those comments. The current version has moved things around, renumbered things, and made some changes for the worse in some of its Policies and Implementation Measures, but it has changed its text little in its actual description of the project, its description of the proposed project’s location, its description of the project’s environmental setting, its description of the proposed project’s significant environmental effects and mitigation measures, its analysis of a reasonable range of alternatives, its analysis of the proposed project’s growth-inducing impacts, its analysis of the proposed project’s cumulative impacts, its explanations of why some environmental impacts were considered less than significant. **It has been revised and re-circulated, but it has failed to respond to many pertinent comments on significant environmental issues.**

I17-892

### 13. TRANSPORTATION & CIRCULATION

Given the requirements of AB32 and SB375 (and its new Climate Action Plan), the diminished health and safety of its citizens (already suffering from some of the worst air quality in the nation), and the higher fiscal costs to the County of the continuation of its current sprawling development patterns (the County can’t begin to maintain even its existing roads), the GPU/RDEIR must direct growth into the efficient, compact, healthy patterns (focused on areas with existing job opportunities, services, and infrastructure) that reduce automobile dependency and ever-increasing VMTs. The policies and implementation measures in the **Transportation and Circulation Element** do far too little to advance that priority (this is especially troubling since clean air was probably the #1 highest priority expressed by the public in the General Plan Update and Regional Blueprint workshops in Tulare County). In the **Public Transportation and Other Transportation Modes sections**, the policies are almost universally vague and weak in their wording (“support,” “work with,” “evaluate,” “encourage,” “promote,” “consider”), as are the Implementation Measures, and all but four of them have timeframes that are “Ongoing,” indicating that they are already in effect (although the corresponding programs are labeled as “New”).

I17-893

**Please clarify and strengthen these policies and provide them with concrete, measurable IMs. In their current form, they cannot serve as effective Mitigating Policies and Implementation Measures for purposes of CEQA and the RDEIR.**

I17-894

**Also, Figure 13-1 – Tulare County Road System (GPR p. 13-5) shows the different types of roads in the County, but does NOT show the roads designated for “scenic.” Please include that information in the Legend and on the map, as “scenic” routes should have special consideration in the Transportation and Circulation element, and are very important resources for recreation and tourism. This should be addressed in this element.**

I17-895

**The “Proposed State Highway 65 Alignment” is depicted on this map (and in Figure 2-3 Rural Valley Lands Plan Portion of the Land Use Diagram, RDEIR p. 2-16). Where is this proposed alignment discussed in the GPU/RDEIR? How should this proposed alignment affect land use and planning in the County? Has it in no way been taken into account in the planning and land use considerations for the next 20 years? Please discuss this in the GPU/RDEIR in order to properly inform the reader of this proposed major development in Tulare County and its potential impacts.**

I17-896

**TC-3 Goal (GPR p. 13-9):** The rail services Goal (TC-2) has been repeated here. It should be replaced by the Aviation goal (see p. 12-5 in the 2008 GPR).

I17-897

**TC-3.5 Private Ownership (p. 13-9):** Please explain the rationale behind this Policy, which says that the County will consider development and maintenance of privately-owned and operated airport facilities as long as their development and operation “does not result in adverse impacts on the operation, maintenance, and long term viability of existing airport facilities.” It does not appear that the County is applying the same rationale to considering development of New Towns and highway growth corridors on the “operation, maintenance, and long term viability of existing” communities and businesses in the County. Please discuss and clarify for the benefit of readers and decision-makers.

I17-898

**TC-4.4 “Nodal Land Use Patterns that Support Public Transit” (p. 13-6):** This Policy will only “encourage” land uses that generate higher ridership to be clustered within a convenient walking distance of one another; it has no Implementation Measure. Please clarify and strengthen the Policy and provide it with a concrete, measurable IM.

I17-899

**TC-4.5 “Transit Coordination” (p. 13-6):** Please clarify this vague Policy (how will the County “encourage” coordination to support better connectivity?). The only IM for this Policy (IM#20, p. 13-15) states that the County will work with transit operators to develop a Fast Pass system for transfers (this is labeled a New Implementation Measure, but its timeframe is “Ongoing”); please include additional IMs to improve connectivity between

I17-900

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

County and City systems, such as coordinated schedules and stops, stops that connect to bikeways, and the provision of bike racks on all buses. | I17-900  
cont'd

TC-5.1 “Bicycle/Pedestrian Trail System” (p. 13-11): Please add to the Policy statement: “. . . trail system that provides a linked network with access to recreational, cultural, *educational*, and employment facilities . . . .” | I17-901

Implementation Measure #21 (p. 13-15): Please change “will” to “*shall*” (“. . . projects *shall* be conditioned to incorporate . . .”).

Implementation Measure #22 (p. 13-15): As evaluation is **not** implementation, please change to: “The County shall *require the provision of* facilities for non-motorized users (e.g., bicyclists, pedestrians) *as appropriate* in new development projects; all new development projects shall provide trails, sidewalks, and/or bicycle lanes, as appropriate to promote safe active transportation.”

TC-5.2 “Consider Non-Motorized Modes in Planning and Development” (p. 13-11): Please strengthen this important Policy: “The County shall *require* incorporating facilities for non-motorized users . . . .” “For developments with 50 or more dwelling units or non-residential projects . . . demand, *the provision of sidewalks shall be the minimum requirement.*” | I17-902

The Transportation and Circulation portion of the **Background Report, Section 5.12 “Non-Motorized Systems,” “Existing Conditions”** (p. 5-72) describes the Tulare County Regional Bicycle Plan, and Figure 5-9 (p. 5-72) depicts it, showing several routes around the County. Neither the Figure nor the text indicates the status of the bike routes depicted. The Tulare County Regional Bicycle Plan (consulted online) **shows under “Existing Bikeways” in the unincorporated County a single bikeway, in Three Rivers, along SR 198.** This bikeway is shown in Figure 5-8 as a Class I (separate path) facility. We live in Three Rivers and know that this bikeway shares the roadway (with a stripe, making it Class II). | I17-903

**The Background Report should be revised to provide accurate information about the status of the routes of the Regional Bicycle Plan.**

Additionally, Figure 5-9 in the BR is labeled “**TCAG Regional Transportation Bicycle Plan.**” Figure 5-9 (BR p. 5-73) does NOT depict any bikeways except “Planned Bikeways.” In the GPR, we have **Figure 13-2 (GPR p. 13-12), labeled “Regional Bicycle Transportation Plan,”** which has a Legend depicting 3 types of Future Bike Projects. Neither depicts any *current* bicycle transportation routes. **Are there any in the unincorporated County? When and where are any bicycle transportation routes going to be completed in the unincorporated County?** The BR never specifically answers these questions, but talks only in very general terms about the process (p. 5-78). Was Measure R money allocated to bikeways? If so, what happened to it? | I17-904

The Background Report (p. 5-75) states that county standard **sidewalks** are provided within and around school and recreational areas “where appropriate and enhance the safety of those who choose to use these facilities.” **The** | I17-905

198

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

**Background Report should be revised to state where such sidewalks have not been provided and what factors designated those locations not “appropriate.” Shouldn’t all school children be afforded the safety of sidewalks around their schools and recreational areas?** | 117-905  
cont’d

The Background Report (pp. 5-75) describes the Safe Routes to School (SR2S) program and states that many agencies in Tulare County are eligible to apply for funding; **the Background Report should be revised to indicate whether any Tulare County agency has applied for the funding and what the results have been**, because it lists many benefits of active modes of transportation, including increased physical activity, healthier lifestyle, less traffic congestion, safer streets and neighborhoods, and improved air quality and a cleaner environment. | 117-906

**The Background Report states (p. 5-80) that public transportation is used by only 0.5% of commuters in the County, and that there are only two Park and Ride parking areas (comprising 38 spaces total) in the entire County, with the possibility of a third in the future (p. 5-81); the Background Report should be revised to discuss whether public transportation routes and schedules conveniently connect major employment centers to the areas where their workers live, and whether the Park and Ride facilities are adequate to demand.** | 117-907

The Background Report (p. 5-80) brings up Jobs to Housing Ratio, or jobs-housing balance, but **never relates it specifically to Tulare County**, examining the types and wages of jobs available in our various communities versus the skills of workers and housing costs; **this section should be revised to do so.** | 117-908

In short, the Background Report and RDEIR too often fail to relate theirs general information to Tulare County specifically and to provide a detailed description of existing conditions that will enable the reader to meaningfully relate the background information to the land-use planning and environmental information in the GPR and the RDEIR (which generally duplicates the BR information, although sometimes, as for this section, in condensed form); **it must be revised to do so.** (It may also be noted that the RDEIR should be updated; e.g., p. 3.2-18, did TCAG adopt the Tulare County Regional Bike Plan at the end of 2007? Also, p. 3.2-18 states that “Tulare County has historically developed walkways for recreational and practical purposes,” and then gives examples of 3 trails, 2 located in the City of Visalia and 1 in the City of Porterville. Were these trails developed by the County or by the Cities? This is typical of the RDEIR: broad brushstrokes about what has been done and what could be done, but far too often failing to state what the *County* actually has done and will do (which is a big part of the informational purpose of the GPU/RDEIR). | 117-909

**The RDEIR (p. 3.2-36) states that the GPU would result in increased demand for public transit services. It states that “Largely market driven, transit service will expand as needed and will be self mitigating” (p. 3.2-36). Is it actually the case that market-driven transit service will expand as needed, or will it only expand if that will be profitable? Has market-driven transit proven to be the most successful method of increasing ridership and thus** | 117-910

199

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

reducing air quality impacts and GHG emissions? **Aren't land-use policies that direct development into compact, efficient patterns centered on existing urbanized areas, with their job opportunities, commercial and service centers, and educational, recreational, and cultural opportunities much more likely to promote the use of public and active transit (and to create and enable a market for it)?** | I17-910  
cont'd

Isn't it even then usually the case that public agencies must at least partially fund a successful transit system (realizing that the cost is offset by the benefits to air quality, reduction of congestion, reduction of GHG emissions, reduction of parking space requirements, etc.)? **The related policies and implementation measures, as discussed above, are generally too vague and lacking in concrete implementation measures to be relied on to substantially increase public transit usage.**

The DEIR indicates that the County's primary approach to transportation and circulation issues will continue to focus on adding lanes to roads and adding and improving interchanges. **The DEIR should be revised to discuss the role of land-use patterns and efficiencies in affecting traffic levels and enabling greater reliance on public and active transit.** | I17-911

**The DEIR should evaluate the relative costs of providing suitable levels of service for transportation and circulation with compact, efficient development compared to sprawl development.** | I17-912

**The DEIR should evaluate the impacts on public health and safety, air quality, and GHG emissions of transportation and circulation under compact, efficient development centered on existing urbanized areas compared to current inefficient, vehicle-centric development.** | I17-913

**The RDEIR states (p. 3.2-21) that "Transportation and circulation needs are closely tied to the location and distribution of land uses"; the RDEIR should be revised to explain how the GPU/RDEIR functions to locate and distribute land uses so as to facilitate meeting transportation and circulation needs, with special attention paid to increasing the use of public and active transportation.** | I17-914

**It is very important that the GPU/RDEIR be revised to require that all transportation and circulation projects consider and mitigate for their impacts on health, safety, and equity, and that all of them include provisions to support walking, biking, active recreation, and affordable public transit, while achieving or exceeding environmental benchmarks for climate change.** | I17-915

Tulare County suffers from some of the worst air quality in the nation, costing us dearly in human misery, lost school attendance, absences from work causing lost productivity and lost wages, excessive hospitalization and emergency room visits, premature deaths, negative impacts on agricultural productivity, and hospital and insurance costs. Our children and seniors and those with respiratory and cardiovascular illness are particularly affected (this is substantially more than half our population). **The GPU should require that transportation projects must be designed to meet the transportation needs of low-income people and eliminate disparities in access to and affordability of public transit and walking and bicycling infrastructure near homes, jobs, and services.** Tulare County has a very high percentage of low-income residents, making this emphasis especially important. | I17-916

200

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

The GPU/RDEIR should require that transportation and circulation projects be designed to meet and exceed the requirements of AB32 and SB375 to reduce VMTs, GHGs, and the use of single occupant vehicles. The GPU/RDEIR should require that transportation and circulation projects meet clear, regularly measured outcomes to scale up walkability, bikability, and public transit (e.g., percentage of people walking and biking, percentage of people within ¼ to ½ mile of food retail and affordable housing as performance measures of coordinated land use and transportation.	I17-917
The GPU/RDEIR should require traffic calming measures (such as raised medians, roundabouts, etc.) should be incorporated to improve safety for both vehicle occupants and non-motorized travelers.	I17-918
The GPU should require projects to always promote Safe Routes to School, and should include an indicator for percentage of students walking or biking to school as a coordinated land use performance measure.	I17-919
The GPU/RDEIR should require projects to promote transit-oriented, mixed use development, connected to affordable housing, jobs, and essential services, putting more County residents within easier reach of public transportation and key needs.	
The GPU should also require that transportation and circulation projects be designed so as to maximize preservation of farmland, open space, and scenic landscapes. We clearly cannot afford to continue to operate under the old model of just building more and more (and bigger and bigger) roads to carry more and more vehicles to more and more locations, regardless of the cost to the economy, equity, and the environment.	I17-920

## 14. PUBLIC FACILITIES AND SERVICES

Here, as is the case throughout this GPU/RDEIR, information on a particular subject area is, and probably necessarily so, scattered throughout the component documents. It would be very helpful to readers and decision-makers if that information could be at certain critical points combined and synthesized to provide a convenient reference point as an aid to evaluating related information. It is also important to ensure that the information provided is consistent and complete, not inconsistent and confusing.	I17-921
For example, in reading the PFS Element (including the GPR, BR, and RDEIR), it would be very helpful to have summarized in one spot the background information regarding this subject for the unincorporated developed areas. The 21 communities are listed on pp. 2-4 – 2-5 of the GPR and mapped in Figure 2.2-1 (p. 2-13) collectively and then individually in following Figures (confusingly, Figure 2.2-11 maps the Patterson Tract UDB, although this has not been identified as a community, nor as a hamlet). The 11 hamlets are listed on p. 2-35 of the GPR, mapped collectively in Figure 2.3-1 and then individually in following Figures. The 8 incorporated cities are listed on p. 2-49 of the GPR, mapped collectively in Figure 2.4-1 (p. 2-56), then mapped individually in the following Figures. The Patterson Tract appears on Figure 2.4-8 (City of Visalia). But what is the Patterson Tract? GPR p. 2-2 now includes the explanation that Patterson Tract is a <i>neighborhood</i> , as is East Porterville, and that there are many smaller ones, including, but not limited to, Rancho Sierra, Tooleville, Cameron Creek, and Oak	I17-922

201

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

Ranch (of these smaller ones, only Tooleville is ever mentioned again in the GPU/RDEIR documents). The Visalia map (Figure 2.4-8) also shows East Visalia, never discussed anywhere, and Goshen, which is a community. I17-922  
cont'd

**Throughout the GPU/RDEIR documents, place names appear and disappear without explanation of why they are included in some lists and Tables and maps and not in others and discussed in some related texts and not in others. This seriously disrupts and confuses the informational function of the GPU/RDEIR.**

Which places should be discussed and why? Into which places does the GPU intend to direct growth? Those are the places that should be consistently labeled, consistently placed on maps and in other figures and tables, consistently provided with the same information for both existing conditions and for conditions at GPU buildout, consistently evaluated for impacts and mitigation (e.g., population, infrastructure, services, capacity, community/hamlet/MSJ plan status, environmental conditions, etc.). The piecemeal hodgepodge approach to delivering essential information that prevails throughout the sections on public facilities and services makes it almost impossible for the reader to discern any clear picture of where and how and why the County means to grow and develop and what the capabilities and impacts and results would be in the designated areas. The GPU/RDEIR must be extensively revised in these sections to correct these deficiencies. I17-923

It must also be noted that the RDEIR states on p. 3.9-4 that "the incorporated cities, communities and hamlets Tulare County has identified as potential urban growth areas are located on the valley floor in proximity to the productive agricultural lands." This completely ignores the fact that the County has been working for years on the J.G. Boswell proposal to develop Yokohl Ranch (RDEIR p. 5-6), a New Town which is planned to locate 30,000 residents in the foothills (NOT the valley) on land currently zoned as Extensive Agriculture. This gigantic proposed development projects buildout largely within the GPU horizon. Only a few acres in the 36,000 acre property area are irrigated. The GPU/RDEIR is profoundly inadequate due to its failure to describe and analyze the baseline and impacts of this enormously growth-inducing proposed project in its discussion of all of the various elements of the GPU/RDEIR. I17-924

RDEIR p. 5-5 states that "the following General Plan Amendments and General Plan Initiatives are taken into consideration for the cumulative impacts discussion and analysis" and lists Goshen, Yokohl Ranch, Rancho Sierra, and Earlimart. Yokohl Ranch, by far the largest of these, is never mentioned anywhere else in the GPU/RDEIR. The GPU/RDEIR must be extensively revised to correct this deficiency. It should include discussion of the GPA/GPI developments in Goshen, Rancho Sierra, and Earlimart as well, describing how they accord with the County's design for land use and development in accordance with the Goals, Policies, and Implementation Measures of the GPU/RDEIR. I17-925

**MAPS RECOMMENDATION:** The maps should be revised to indicate the current population and area (acreage) within the existing development boundary for each urbanized area shown, and to also indicate the I17-926

proposed population capacity under the GPU buildout and what the acreage difference is between the UDB and the UAB (in many cases, would the proposed urbanized area changes have to be an approximation; e.g., with hamlets, of the acreage currently developed and the acreage within the proposed HDBs?). This would **help readers and decision-makers to “see” where we are now in terms of population and area urbanized for each of the communities, hamlets, and incorporated cities, and what is proposed under the GPU/RDEIR.** Please provide baseline maps with this information and then maps that show the expected build-out under **EACH** of the RDEIR Alternatives. Please also indicate on the maps where the various TYPES of land uses would occur under the different RDEIR Alternatives.

I17-926  
cont'd

**In the Background Report (BR) Public Service and Utilities Section, Table 7-1 – Community Water Suppliers** (p. 7-11) lists the communities, but **omits Sultana and East Oroshi**. Page 7-12 of the BR lists “additional unincorporated urban areas” not formally designated as communities. These 13 areas are the 11 designated as hamlets in the GPR (p. 2-35), plus East Oroshi and Sultana, which the GPR designates as communities. The following pages provide discussion of the information for the communities (except Sultana and East Oroshi), as summarized in Table 7-1 (only Poplar is indicated on p. 7-22, but, presumably, that information is for Cotton Center as well). There is **no Table to summarize the water situation of the hamlets.**

I17-927

Next, there is discussion of Allensworth (a hamlet) on p. 7-29 ff, then a brief discussion of East Oroshi (p. 7-29. This is followed by a discussion of the **Ponderosa CSD** (p. 7-29 ff). Ponderosa would presumably be part of the Mountain Framework Plan, but we don’t find it listed in the MFP, nor do we find it in the map figures following p. 4-10 in the MFP. **Why is Ponderosa briefly discussed, but not the other developed areas (MSCs) in the Mountain Framework Plan** (Alpine Village-Sequoia Crest is mentioned on BR p. 7-39 as having a septic system, but nothing is said about its water, and it’s never mentioned again in the GPU/RDEIR except to be shown on Gi. 4-4 in Appendix C of the Background Report)?

I17-928

Page 7-31 of the Background Report mentions **Delft Colony** (a hamlet), **Traver** (a community), and **Yettem** (a hamlet) as zones of benefit, and states that Seville (a hamlet) is included in the Yettem water zone of benefit, but served by a private water company. These urbanized areas are under County Service Area governance, but **no information about water quality or capacity is provided here.** The **Wells Tract** is mentioned next, but it is neither a hamlet nor a community. Is it proposed for growth? Is it on one of the maps? **No water information is provided on the remaining hamlets (East Tulare Villa, Lindcove, Monson, Teviston, Waukena, West Goshen).** Please provide this information completely, consistently, logically, and comparatively.

I17-929

The correctory dated January 25, 2008, included 28 maps showing CSDs, PUDs, CSA # 1 and #2, the Lemon Cove Sanitary District, the Terra Bella Sewer Maintenance District, and Tulare County Water Works District No. 1. One map depicts **Tract 92 CSD**; we have encountered no other information about Tract 92 in the GPU documents, except that it appears in the NOP Mailing List. Ditto for **Tulare County Water Works District No. 1**. The maps

I17-930

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

203

now appear as a series of Exhibits in Appendix B of the Background Report. Some of their names have been changed. How about Porter Vista PUD (now Exhibit 1-20)? **Why are entities such as Porter Vista mapped but never discussed?** (Although Porter Vista PUD is listed on Table 3.9-10, RDEIR p. 3.9-19.)

I17-930  
cont'd

Page 7-33 of the BR lists the **“Can’t Serve” Special Districts**: Alpaugh (community), Cutler (community), Delft Colony (hamlet), Earlimart (community), **El Rancho Zone of Benefit** (neither hamlet nor community), Orosi (community), Pixley (community), **Pratt Mutual Water Company** (unexplained; a Google search reveals that it appears to serve the City of Tulare), Richgrove (community), Seville (hamlet), Tooleville (not a hamlet or a community; is it proposed for growth? Is it on a map? GPR p. 2-2 now lists it as a “small neighborhood” community), and Wells Tract (neither hamlet nor community).

I17-931

**Table 3.9-5 – Change in Water Demand (RDEIR p. 3.9-10)** lists under “CACUDB” the communities including Delano and Kingsburg (ordinarily not included on any of the other Tables), additionally lists the neighborhoods of East Porterville and Patterson Tract, but fails to list Sultana (which the GPU/RDEIR documents can’t seem to get used to considering as a community; it is also omitted, for example, on Table 3.9-7 and Table 3.9-9, ). **None of the hamlets are included on the latter two Tables either (except for Teviston in Table 3.9-7), and the neighborhoods have dropped off, too. And so it goes. We hope you can see how confusing this is.**

I17-932

**How many different places are we dealing with in the water section, and what determines which places are on and off which lists? Why can’t the information be obtained for so many of the hamlets? Why are a few places that are neither hamlets nor communities being included, but not others? What happened to the Mountain Service Centers?**

I17-933

**Why can’t all the places that are going to be discussed be put into one table, so that we can get the overview information all in one place? Why can’t that table cover both water and sewer/septic information together in brief form? It would be helpful if the table also showed the population of the places listed, and if the table showed critical information such as “Can’t Serve” status. (We find population information in many different formats, based on different sources, and for different years and for different places in the various documents; this information should be compiled into a single comprehensive list and combined with the capacity information.)** There should be a comprehensive Table with all of this information for the baseline condition and then a comparative Table showing the GPU buildout figures; the buildout Table should be repeated to reflect the figures as they would be modified by each of the different Alternatives in the RDEIR.

I17-934

Turning to **Sanitary Sewer Infrastructure (BR p. 7-34 ff)**, we become more confused by inclusions and omissions and no comprehensive table. **BR p. 7-39 lists areas that lack sanitary sewer infrastructure and are served by individual or community septic systems.** These are Allensworth (hamlet), Alpaugh (community), **Alpine Village-Sequoia Crest** (not a community, not a hamlet, not listed or mapped in the Mountain Framework Plan ), Ducor

I17-935

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

204

(community), East Tulare Villa (hamlet), Lindcove (hamlet), Monson (hamlet), Plainview (community), Ponderosa (not a hamlet, not a community, not shown in MFP), Three Rivers (community), Teviston (hamlet), Waukena (hamlet), West Goshen (hamlet), and “other unincorporated areas not listed in Table 7-2.”	I17-935 cont'd
So we go to Table 7-2 – Summary of Sanitary Sewer Service System Providers (BR p. 7-41, and also RDEIR p. 3.9-19) and find 26 service providers listed, most of which can be easily related to hamlets and communities. But what is Porter Vista PUD serving? El Rancho, Tooleville, and Wells Tract again are listed, and are briefly discussed on p. 7-52, 7-53, and 7-54. How do these places figure in the County’s land use and development plan in the GPU/DEIR? Earlimart PUD is shown at 100% capacity in Table 7-2, but on p. 7-43, it is said to be operating at 65% capacity “assuming the plant has been certified to reliably treat 1.24 MGD.” Why not phone Earlimart PUD and find out whether the assumption is correct?	I17-936
Storm Drainage Infrastructure is discussed on BR p. 7-55 ff. In the introductory paragraph, does the statement about the “small communities” refer to the hamlets and the MSCs as well (and the other places mentioned in the water and sewer sections)? The only storm drainage systems discussed are for Cutler-Orosi (BR p. 7-62) and Goshen (p. 7-65). Plans are mentioned on p. 7-65 for Earlimart and Poplar-Cotton Center , and the implication is that something is going to be built in Richgrove .	I17-937
In general, this section is extremely vague about the Existing Conditions. It mentions (BR p. 7-62) that “development that occurred prior to 1972 generally does not have storm drainage infrastructure installed [in] most of the unincorporated areas of the County. This has led to a need to improve such areas that lack drainage through redevelopment funding or other sources of available funding.” So, which of the communities, hamlets, MSCs, and “others” have substantial development that occurred prior to 1972? How many of these places are in need of funding for improvement? How many have received funding and made the needed improvements?	I17-938
It’s time for another good Table. How can the reader be properly informed of these places’ capacity for growth and development when this critical information is not provided? How can impacts be assessed with no baseline? Please revise the GPU/RDEIR documents to provide this important information clearly, comprehensively, comparatively, currently, and logically. Lack of adequate storm drainage systems in areas proposed for further growth and development in the GPU will create significant adverse environmental impacts.	I17-939
Is it correct to assume that for all the other unincorporated communities and hamlets (and other places mentioned in the earlier sections) the information on BR p. 7-58 is applicable, that they have “. . . only surface drainage which is more subject to flooding, and/or not properly functioning due to little or nonexistent facility maintenance . . . . a potential threat to wildlife, farm animals, and groundwater supplies . . . because there is limited ability to treat the water before it flows into a basin, or other surface waters, such as a creek, irrigation ditch, or river . . . [it can] pick	I17-940
Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR	205

up contaminants from paved surfaces including but not limited to oil, antifreeze, and rubber.” Or is it just that they’re not being covered “. . . due to the time intensive efforts of evaluating the storm drain infrastructure of each community?”

I17-940  
cont'd

**Please provide in the single comprehensive master list overview table an indication of the storm drainage situation for all the places under consideration for development.** If we don’t have time to evaluate their storm drain infrastructure, then we’d better remove them from the list of places designated by the GPU/RDEIR for growth and development, because we certainly don’t have time (or money) to deal with the results of flooding in those areas, especially not groundwater contamination.

I17-941

**INADEQUACIES OF TABLES:** Consolidating this information and making it quickly accessible is very important because the public and decision-makers need to be able to readily locate and compare the basic facts about the infrastructure of the unincorporated areas being proposed for development. The DEIR Alternatives and the Policy Alternatives document offer choices, but there is no comprehensive, consistent, consolidated table to provide a factual summary with which to consider the relative desirability and feasibility of the Alternatives.

We have just briefly reviewed the confusing inconsistencies and lacunae in the Background Report’s information (which is echoed, although more briefly, in the RDEIR). The **Policy Alternatives document**, cited on RDEIR p. 2-24 and available on the County’s website) does offer **population information** in a Table called **Capacity within Tulare County** (p. 9), but it shows only 20 of the communities (omitting Sultana), and none of the hamlets or MSCs, or any of the other (seemingly random) places mentioned above in the Background Report and RDEIR that are neither communities nor hamlets.

I17-942

**It should be noted and remembered that the Policy Alternatives document remarks on p. 8 that the County’s consultant team conducted an analysis of the remaining residential holding capacity of the 8 incorporated cities and the unincorporated communities** (these communities ONLY, excluding the hamlets and MSCs, etc.) **and found that an additional 950,000 people could be accommodated within the cities and these communities ALONE without designating any more land for residential use.** This is, of course several times the population growth projected for the GPU (and it’s at 25% 1 du/acre, 35% 4 du/acre, 25% at 7 du/acre, 10% at 12 du/acre, and 5% at 20 du/acre. Presumably, given the projected population at GPU buildout, all of the needed growth and development could accommodated within the existing UDBs of the incorporated cities and unincorporated communities. We clearly have no need whatsoever for any New Town or Growth Corridorss

As discussed previously, the **GPU/RDEIR should create a master list Table of the places being designated for growth and development under the GPU and show this information as statistically correct and current as**

I17-943

possible. It should continue the master list Table with information on infrastructure and service capacity of the places being designated for growth, with some of the data points as follows: | I17-943  
cont'd

A Table on p. 12 of the Policy Alternatives (Selecting Focus Communities for Community Centered Alternatives) lists water and sewer information for the communities only (omitting Sultana), but it frequently does not match the information provided in the Background Report (e.g., it says water information is not available for Alpaugh, whereas the BR states that Alpaugh is in “Can’t Serve” status (p. 7-33), has 295 water connections, arsenic, flat rate, etc (p. 7-13, etc.);  
it lists “East Porterville,” which is not listed in the GPR or in the BR as a community or a hamlet or a place, etc.; says no information is available for Lemon Cove, when the BR provides information, etc., etc.)  
The GPU/RDEIR, of course, needs to complete this type of information for all of the places for which growth is designated in the GPU/RDEIR on the master list Table; including RDA information for each place would also be helpful. | I17-944

Page 2-24 of the RDEIR states that, “with County Board of Supervisors direction,” it was determined that “the unincorporated portions of the County *could* accommodate approximately 25% of future new growth.” Given the people’s priorities, the existing conditions in the County, the impacts of global climate change, the requirements of AB32, SB375, and the County’s Climate Action Plan, the chief concern of the GPU/RDEIR should be not just where future new growth *could* be accommodated, but where it *should* be accommodated, and why. | I17-945

Capacity, cost-effectiveness, quality of life, preservation of agricultural and open space lands and scenic landscapes and habitat, efficient public transportation and active transportation that reduces VMTs and GHGs, jobs/housing ratios, air quality, water resources, economic vitality and diversity, health and safety of the public and the environment, provision and maintenance of infrastructure and services, effective mitigation of impacts – all these factors must be carefully and comprehensively compiled and presented by the GPU/RDEIR to inform the public and decision-makers and enable a strong, clear, meaningful, and effective General PLAN Update/RDEIR to be adopted. | I17-946

Page 2-24 of the RDEIR goes on to state that 75% of the expected population growth is expected, under the GPU, to occur as a result of annexations within the CACUDBs and SOI of the incorporated cities, while “25% (78,490) is expected to occur *mainly* within unincorporated communities and hamlets and foothill development corridors, urban and regional growth corridors, and mountain service centers.” But WHERE in these thousands of acres will new growth and development be directed, and on what basis and to what degree?  
And what about the growth-inducing New Towns, such as the proposed Yokohl Ranch? It’s projecting a buildout population of about 30,000 people, presumably mostly within the GPU horizon. How has this been factored in to the GPU’s growth and development allocation? RDEIR page 2-24 states that “these future growth assumptions | I17-947

are consistent with *several* of the General Plan 2030 Update *objectives specific to growth issues* and the *policy guidance provided in the Planning Framework Element*.”

I17-947  
cont'd

Please state here what these objectives are and what the policy guidance is, and how that produced the 25% figure. The GPU/RDEIR is seriously deficient because it does not present this necessary information; it must be extensively revised to do so clearly, logically, and relevantly.

Page 2-25 of the RDEIR states that “*major infrastructure investments* by the public and private sectors are a necessary precursor to enable growth in the County.” The GPU/RDEIR must much more clearly, fully, and specifically inform the public and decision-makers of this requirement. In which of the places listed on p. 2-24 will major infrastructure investments be required? How much and why? How long is it likely to take to provide this infrastructure, given that the County and the State appear to be broke?

I17-948

Page 2-26 of the RDEIR (Section 2.2 Communities, PF-2.6 Land Use Consistency) says that all community plans will be required to use the same land use designations as in the GPU, and to use a similar form and content. It says that the content *may change due to the new requirements* such as Global Climate Change and Livable Community Concepts.

I17-949

Given that about a third of the unincorporated communities have never yet gotten a plan, and that evidently none of the hamlets, MSCs, or development corridors have plans, and that most of the 12 existing community plans are in great need already of revision, how and by when will this important planning get done? Why would the County direct growth and development into places that don’t have plans? How will this promote Livable Communities that are minimizing environmental and climate change impacts? It seems that in many cases, the County is intending to put the cart before the horse and to continue to grow and develop without appropriate prior planning.

**CONTINUING INADEQUACY OF INFORMATION AND ANALYSIS:** In 2008, DEIR page 4-106 (below Table 4-4 – General Plan Population Estimates by Unincorporated Community) stated that “*water system descriptions and analysis for hamlets, and other unincorporated areas are not analyzed in detail as a part of this EIR analysis since projected growth for these areas has not been specifically modeled, and much of the information regarding these small water systems is still being obtained . . .*” What is the logic of this, when some of the hamlets and “other” areas have larger populations than some of the communities (e.g., Delft Colony – about 500, Seville – about 1000, E. Porterville – about 6700, etc.)? (Also, what happened to this Table and the corresponding text? We can’t find it in the RDEIR. Please tell us where it is.)

I17-950

Shouldn’t the County already have the information for the eight urbanizing areas that are in CSA #1 and CSA #2; sanitary sewer information is provided for them, so why not detailed water information? Given that the GPU has been in preparation for several years, surely this information could have been obtained for all the urbanizing areas discussed in the various GPU/RDEIR documents. How can growth be planned and allocated without information on the absolutely fundamental criterion of water availability and quality?

I17-951

208

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

In 2008, DEIR p. 4-106 went on to say that “Policy PF-3.3 of the General Plan would require the County to ensure that Hamlet Plans are updated and maintained” and “a discussion of the hamlet’s *[sic]* short- and long-term ability to provide necessary urban services is also to be provided within Hamlet Plans.” **Do any of the hamlets currently have plans?** If not, how can they be updated and maintained?

I17-952

The first Implementation Measure (#18 on GPR p. 2-75 for Policy PF-3.3 has a timeline for “The County, led by the Planning Commission” commencing in 2015-2020 (formerly, 2010-2015), to “conduct a citizen outreach effort in Tulare County hamlets to prepare guidelines for the preparation of hamlet plans.” IM#19 (GPR p. 2-76) extends the hamlet plan process: “Upon adoption of guidelines for preparation of hamlet plans, the Planning Commission shall prepare an implementation schedule and budget that prioritizes the order in which hamlet plans and any associated environmental documents shall be programmed during the budget process. On an annual basis, or as may be needed, the Planning Commission shall review and recommend priorities for hamlet plan preparation to the Board of Supervisors.” Same Timeline information as for IM#18.

Unfortunately, given the number of years it takes to get a community plan written or updated, it seems very likely that many of the hamlets may not get their plans completed within the GPU time horizon, not to mention the MSCs or the unincorporated communities that have never yet gotten a plan.

**INADEQUACY OF RDEIR ALTERNATIVES:** The Policy Alternatives (August, 2005) document says on p. 12 that the Transportation Corridors Alternative selected communities adjacent to State Routes 65 or 99 for a greater share of growth projected for the communities, while the Rural Communities Alternative selected those with Redevelopment Project Areas established or pending, but did NOT consider the communities’ water and sewer systems capacity. **How can a factor so critical to the ability to grow not be considered in selecting the candidate areas for growth and the Alternatives?**

I17-953

In the RDEIR, Chapter 4, Alternatives to the Proposed Project, 4.2 - Factors Considered in Selection of Alternatives (p. 4-1), we learn that the alternatives in the RDEIR” were selected in consideration of one or more of the following factors,” with the third bullet being “the potential feasibility of the alternative, taking into account site suitability, economic viability, availability of infrastructure, and consistency with various applicable plans and regulatory limitations.” Surely, availability and capacity of infrastructure should be a key consideration in the selection process, but this is never specifically addressed in the discussion of any of the alternatives in the RDEIR.

I17-954

Nowhere in the GPU/RDEIR documents is there any discussion of the approximate cost and time that would be required to bring, for example, the 13 unincorporated areas listed in the Background Report as “Can’t Serve” into a condition where they could accommodate any additional development (much less properly service their

I17-955

209

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

existing development); **this critical factor must be discussed.** Furthermore, **what are the conditions that caused so many of the unincorporated urbanizing areas to become so critically straitened** in terms of their water and sewer situations?

I17-955  
cont'd

For example, on RDEIR p. 3.9-51, Table 3.9-22 – Year 2030 Wastewater Treatment Capacity Needs, **urbanizing areas are listed with their existing wastewater connections and their projected 2030 needs, based upon “preferred General Plan Alternative, with necessary adjustments for analysis purposes.”** (The “based upon” makes no clear picture in our minds; which places, per that Alternative, should be included on this Table, and what adjustments were made?)

I17-956

**Of the 25 areas listed**, at least 12 are “Can’t Serve” areas (BR p. 7-33), 7 more are listed as at or near or over capacity for water or sewer, one more has bad nitrate problems with its well water, and another has serious infrastructure problems, leaving **only two, Ivanhoe and Woodville, that seem to be in good shape in terms of both water and sewer.** Yet Table 3.9-22 (RDEIR p. 3.9-51) indicates by its 2030 projected sewer needs that seven of these areas are **projected to grow over 100%** (some much more) and another seven to grow 70% or more. **On what basis are these projections being made?** On the basis of desire for growth? Need for growth? Feasibility of growth?

I17-957

**How will these urbanizing areas provide the tremendous increases in capacity** for not only wastewater treatment, but also for the provision of clean, safe, adequate water supplies? (For example, page C-5 of Appendix C of the Background Report states that Springville’s PUD Board has had a “self-imposed sewer utility moratorium . . . in response to the lack of an adequate method of disposing of the treated wastewater stream” since 1982; that’s 25 years, longer than the planning horizon of the GPU.)

I17-958

We could continue in this vein, but surely the above comments will suffice to show that the presentation of the information on this critical subject is not clear, consistent, coherent, comprehensive, current, or coordinated, leaving readers and decision-makers to wonder how they can rely on it to enable understanding of the background situation, existing conditions, future needs, environmental impacts, and the alternatives for growth. **Please extensively expand, revise, reorganize, logically and consistently present and analyze, and coherently summarize the information in the GPU/RDEIR documents, relating it clearly to land use and growth and development policies, so that the public and decision-makers may confidently rely on it.**

I17-959

As for the Policies and Implementation Measures in the Public Facilities and Services Element of the GPR, the same basic comments apply here as in all the other Elements: **Please make the vague, unenforceable Policies (“encourage,” “support,” “promote,” “consider”) specific and clear; please provide all Policies with concrete, measurable Implementation Measures with Timeframes consistent with the urgency of the need for the**

I17-960

implementation. As currently written, they cannot serve as adequate Mitigating Policies and Implementation Measures for the RDEIR. | 117-960  
cont'd

**PFS-2.1 Water Supply (GPR p. 14-6:** Thank you for adding to this Policy: “by, at a minimum requiring a demonstration by the agency providing water service of sufficient and reliable water supplies and water management measures for proposed urban development.” **Please state** at what point this demonstration will be required and what will happen if the water supplies and water management measures are inadequate to serve the proposed development. **Please provide a concrete, enforceable IM for this Policy. When and how will this be effective?** | 117-961

**PFS-7.1 Fire Protection (GPR. p. 14-10):** The obvious Policy would be to locate new growth where fire protection service already exists and to **strictly limit growth in the higher fire risk areas (especially those with steep slopes, wildland interface, etc.). If we can’t afford to properly serve our existing development, we shouldn’t be putting development in areas that will stretch fire protection services even thinner.** | 117-962

**PFS-7.6 Provision of Station Facilities and Equipment (GPR p. 14-11):** This Policy has been weakened. It formerly said “the County *shall provide* fire station facilities . . . .” **This has been downgraded to “the County shall *strive to provide,*” but it has also added “sheriff” facilities. Again, the GPU/RDEIR should be revised to focus growth in areas where the needed infrastructure and services already exist.** | 117-963

**PFS-8.3 Location of School Sites (GPR p. 14-12):** Thank you for revising this Policy to include bike routes. | 117-964

**PFS-9.4 Power Transmission Lines (GPR p. 14-23):** This Policy should be revised to state also that the County shall work with the PUC and utilities to promote greater energy efficiency in existing built inventory and in all new development, so as to reduce the need for new and ever more impactful transmission lines. The huge public outcry over the last two years against the giant towers proposed along our scenic highways demonstrates the importance of working to reduce energy demand. This would also reduce GHG emissions and provide lots of jobs retrofitting existing residential and commercial structures. | 117-965

## PART II AREA PLAN POLICIES | 117-966

### CHAPTER 1. RURAL VALLEY LANDS PLAN (GPR Part II, p. 1-1 ff, etc.)

**RVLP (GPR Part II, p. 1-1),** first paragraph includes new language that substantially revises the areas covered in the 2008 GPR. The second sentence states that the “RVLP applies to the Central Valley . . .outside the County’s UDBs, HDBs, UABs for cities [and all of the language following is NEW, greatly expanding the areas to which the RVLP will NO LONGER APPLY – and, of course, it is only in the GPU that the HDBs were created,

211

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

eliminating many thousands of acres from RVLP application:] and other adopted land use plans which may include urban corridors, planned communities, and the Kings River Plan. Scenic and regional corridor plans may retain the RVLP subject to the policies developed in those plans.”

I17-966  
cont'd

The GPU/RDEIR must inform the reader of how many additional RVLP acres would be comprised under this vast expansion of areas in which the RVLP would no longer apply, how many acres of what quality (e.g., “Prime,” “Statewide Importance,”) could be involved, and the potential economic and environmental impacts of this change (including the acreage now comprised within the new HDBs). This change indicates that on a very large scale, the RVLP, which has been a landmark agricultural plan for 35 years, is being over-ridden and gutted by the County’s pursuit of development anywhere anytime. **Please explain very specifically how it is in our best long-term interest to turn irreplaceable world class farmland into needless sprawl development, when all the population increase projected through the GPU horizon can easily be accommodated within our existing growth boundaries. Please eliminate this new language from the GPR.**

I17-967

In the 2008 DEIR, page 1-1 (paragraph 4) states that “prime agricultural land is an irreplaceable natural resource,” and that (paragraph 5), “from a property tax standpoint, *agriculture is the only land use that pays for itself when industrial and commercial property is given a cost based on total urban expenditures by government*” (paragraph 5). Paragraph 6 states that “much of the blame for wasteful checkerboard sprawl lies with the lack of an effective system to direct new development into better patterns.”

Does the County believe that these statements are true? If so, it should ensure that this GPU contains clear, enforceable policies and concrete implementation measures that will ensure that new development is resource-efficient and is focused in our existing urbanized areas and that will offset unavoidable impacts to agricultural lands with mandatory mitigation measures such as permanent easements at a minimum 1:1 ratio on agricultural lands of equal or greater quality within Tulare County..

Please explain why the 2010 GPR (Part II, p. 1-1) has changed the 2008 title “Policy Development Background” to “Tulare County Annual Crop and Livestock Report” and then **deleted three key paragraphs on this subject that appeared in the 2008 version (DEIR Part II, p. 1-1). Please restore this important information** regarding the background to the development of the RVLP. **It is very important to the reader’s understanding of the RVLP.** The information regarding farmland lost to date should be updated. Also the rate of farmland conversion should be reported and analyzed. The property tax information, “Agriculture is the only land use that pays for itself,” should be reviewed and presented on the basis of current information.

I17-968

Here’s the information deleted in the 2010 version:

*“Urban and suburban development in Tulare County is intruding into prime rural agricultural lands at an increasing rate. Each year hundreds of acres of prime agricultural lands [is this now thousands of acres?] are being taken out of production in order to make way for suburban ‘ranchettes’ or parceled into small*

212

*lots for investment purposes. Once this is done, it is virtually impossible to reassemble the land into viable agricultural units.*

117-968  
cont'd

According to the Agricultural Census, Tulare County lost 66,000 acres of farmland between 1964 year and 1969 year. *Prime agricultural land is an irreplaceable natural resource*, and its wise use is of as much importance as other natural resources such as coal and oil [we note here that sustainably farmed agricultural land is in some ways much more important than coal and oil, when one gets down to the real basics such as food, water, and air. Also, sustainable farming does not exhaust the resource, whereas coal and oil, once used, are gone].

The effects of piecemeal urbanization on agricultural fringes and the cost of public services to such development should also be understood. In a report prepared by the Ventura County Planning Department in 1970, their findings show that *from a property tax standpoint, agriculture is the only land use that pays for itself, when industrial and commercial property is given a cost based on total urban expenditures by government.*

In spite of the efforts of local government to protect agricultural land through protective taxation or zoning, *much of the blame for wasteful checkerboard sprawl lies with the lack of an effective system to direct new development into better patterns.*"

## CHAPTER 2. CORRIDORS (p. 2-1 ff)

117-969

**C-1.3 "Scenic Corridor Protection Plans" (p. 2-1):** Please cross-reference this Policy to Policy SL-2.1 (p. 7-3) and please explain how these two policies are related to each other. Policy C-1.1 (p. 2-1) mentions Scenic Highway Corridors only along eligible State Highways; what about Scenic County Road Corridors? Please clarify.

**C-1.4 "Regional Growth Corridor Plans" (p. 2-1):** Please explain why the County is proposing these Corridors outside of HDBs, UDBs, or UABs. C-1 states that the Corridors are to provide "an economically viable and balanced land use pattern along major transportation corridors in Tulare County." What prevents locating "economically viable" land uses within existing urbanized areas that already have infrastructure (roads, water, sewer, lights, police, firefighters, etc.), services for employees of the new development (e.g., food, fuel, retail), and a labor pool living right there?

117-970

The County already has many urbanized areas along State Highways 99 and 65. Why would it not be better for air quality to locate the businesses where the people are? Wouldn't it better maintain our viewsheds and our rural character to focus new development on existing urbanized areas? How does it benefit our existing communities to locate businesses outside of their boundaries? Wouldn't the Regional Growth Corridors have much less adverse impact on agricultural and natural resource lands if they were located in already-urbanizing areas? Wouldn't the Regional Growth Corridors not only induce additional sprawl, but be sprawl themselves? Please explain what makes these strip developments "balanced" land use patterns.

117-971

**The GPU/RDEIR should provide a well-reasoned discussion, covering all these points, to clarify why the County is proposing these corridors instead of development based on smart growth principles. The County's citizens told the County they wanted growth centered on existing communities, and they wanted agricultural lands and open space preserved. Why is the County promoting the opposite with these Regional Growth Corridor Plans? How do these Growth Corridors benefit the majority of the people of Tulare County?**

I17-972

**The GPU/RDEIR fails to fulfill any of the CEQA requirements with regard to the Corridor Framework Plan. It does not describe the existing condition of the environment which could be turned into these corridors, nor show how these lands are currently zoned and used; it does not establish a valid baseline and then describe the significant impacts of the proposed corridors, it does not discuss the direct and reasonably foreseeable indirect impacts of the corridors, it never describes the significant irreversible changes and growth-inducing and cumulative impacts (and they are legion) of the corridors, nor does it discuss any meaningful mitigation. And this is the short list of inadequacies and deficiencies regarding the Corridors Framework Plan.**

I17-973

**The County should prohibit the type of development proposed in the Regional and Urban Corridors because it is contrary to resource-efficient, compact, VMT-reducing development focused in existing urbanized areas and will not help the County to comply with AB32, SB375, or its Climate Action Plan.**

I17-974

**C-1.5 "Agricultural Enterprises" (p. 2-1): Same comments as for C-1.4.**

I17-975

**C-1.6 "Regional Growth Corridor Opportunity Areas – Interim Policy" (pp. 2-1 and 2-2): The County should not proceed on the basis of this interim policy. This interim policy allows approval of conversion of greenfield agricultural land and open space for far too many reasons (although it has now deleted the egregious "Notwithstanding" paragraph that was in the 2008 version, which concluded with "any other relevant factor considered on a case-by-case basis," p. 2-2). This is completely unacceptable because it completely contradicts the principles of smart growth, the County's stated commitments to preserving agricultural and open space and to reinvest in existing communities and hamlets, and the people's priorities; it provides for no input from nearby communities and for no mitigation. Please delete Policy C-1.6. No such development should take place. If the County is determined to promote such development no matter what, then no such development should take place until regional growth corridor plans have been specifically prepared, reviewed by the public process, and adopted.**

I17-976

**Implementation Measure #3 (p. 2-4): We ask that you delete this IM, along with Policy C-1.6. If you do not delete this IM, then please revise it by changing its three "should"s to "shall"s.**

I17-977

**NOTE: The 2008 GPR included Implementation Measure #4 (p. 2-4), which stated that the "County shall establish a committee of community resident, businesses, and County staff . to develop corridor plans for State Highways 65 and 99, including phasing and financing measures that builds on valley-wide efforts**

I17-978

214

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

by Caltrans and the Great Valley Center.” The timeframe was 2007-2010. **A specific deadline should have been set for the completion and adoption of these corridor plans, and the County should not approve any corridor development prior to adoption of these plans: NO Regional Growth Corridor development on an “interim policy” basis.** The development so allowed will be permanent, not interim, without the benefit of the plans developed by the committee, and with significant irreversible impacts under CEQA. **WHY HAS THIS IMPLEMENTATION MEASURE BEEN DELETED from the 2010 GPR?** This signals very clearly that the **County no longer has any intention of involving public participation in the process of developing and implementing the corridor plans** for Highways 65 and 99.

117-978  
cont'd

## **PART II CHAPTER 3. FOOTHILL GROWTH MANAGEMENT PLAN (GPR Part II, p. 3-1 ff)**

117-979

**INADEQUACY OF GPR INTRODUCTION TO FGMP:** The County has repeatedly assured the public during the GPU process that the Foothill Growth Management Plan (FGMP) has been restored WITHOUT CHANGES to the GPU. If so, why isn't the original FGMP simply reprinted in its entirety in the Area Plan Chapter 3? The reader is now compelled to go back and forth between the text of the draft GPR and the text of the original FGMP to find out what whether the FGMP has been changed.

**The Matrix (p. 284, under F-1.2) states that “The FGMP has been added back into the Goals and Policies Report, reflective of staff’s desire all along” and (p. 294) “It was staff intent all along to carry the FGMP forward unchanged, except for deletion of the obsolete sections.” Please explain** why the original FGMP has not been simply reprinted in the GRP; why has it instead been disassembled, re-organized, split up, and changed in its emphasis and meaning, contrary to what the public was told? **What is the underlying rationale for these changes? What are the likely impacts** on the foothills of the GPR’s many changes to the FGMP, individually and cumulatively?

117-980

**Please restore the original FGMP** (modifying the parts, of course, that have already been accomplished, such as the Springville Community Plan). The only changes that should be made to the original FGMP, other than to correct outdated information (e.g., re community plans) would be changes that would further strengthen its goals, policies, and implementation measures in order to better protect our fragile foothills from the ever-increasing threat of inappropriate development. As irreplaceable watersheds, viewsheds, habitat, agricultural (mostly extensive agriculture) and open space lands, recreational areas, world-class Native American sites, scenic landscapes, historic and beautiful scenic routes, timberlands, sustainable tourist attractions, oak woodlands, and sources of physical and spiritual renewal (among other values), our foothills are a vital resource to the health, economy, and beauty of Tulare County. And so should they be for generations to come.

117-981

**The introduction to this Chapter (p. 3-1) must explain** how and why the FGMP has been changed in the draft GPR update, the impacts and potential impacts of these changes, and whether additional implementation or

117-982

mitigation measures are needed as a result of the impacts. **Is it the intent of this GPR to incorporate the original FGMP by reference? If so, this must be specifically stated in the GPR.** | 117-982  
cont'd

We are very troubled that we have totally run out of time in this too-brief public comment period (the County took two years to put forth the 2200 pages of the GPU/RDEIR and gave the public only two months to comment) to be able to read and comment on the FGMP sections. Our 2008 GPU/DEIR comments are incorporated below. Please respond to them. Unfortunately, we can see at a glance that many of the Policies have been re-ordered and re-numbered; therefore, please refer to the Policy titles or relevant content wherever the Policy numbers have been changed in the GPU/RDEIR. | 117-983

Same idea for the Implementation Measures. And, of course, due to formatting changes, etc., in many cases the referenced page numbers will also have changed, so please match up the comments to the 2010 documents on the basis of content and not necessarily on the basis of the page numbers cited in our 2008 comments. Thank you.

**Also, please refer to the May, 2010, GPU/RDEIR comment letter from Karen Bodner and Michael Olecki. They are focusing a considerable portion of their comments on the FGMP, and we concur with their analysis and recommendations.** | 117-984

**INADEQUACY OF BACKGROUND REPORT RELATED TO FGMP AREA: The Background Report should include** a detailed, current land use map for the Foothill Area and its development corridors, showing land use designations and features as discussed below, so that readers can "see" the existing conditions; it should also include a detailed map showing the Foothill Area as proposed under buildout of the GPU. **The Background Report should include a detailed discussion of the conditions that exist within this Plan Area;** its current two paragraphs (pp. 3-19 – 3-20) are inadequate to describe this large, varied plan area and its development corridors. | 117-985

The **Table on BR p. 3-20** indicates number of acres for various land uses, but does not show its information in a map, and does not depict how the 86,138 acres designated as development corridors are apportioned among the various corridors, how they are zoned, how many of these acres are already developed and how many are available, how the population is apportioned among them, where and in what types of land uses the area is growing, etc. **Please provide** this information in text and in a clear map format. | 117-986

Page 5-2 of the Background Report states that the FGMP was adopted in 1981, but does not say that it has been amended. However, notes below some of the FGMP Policies in the GPR (e.g., FGMP-2.2 and FGMP-2.3) appear to indicate that it has been amended. | 117-987

**Please clarify whether and when the FGMP has been amended.** | 117-988

216

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

Page 23 of the original FGMP states that its Foothill Development Standards were to be adopted by Ordinance; was this ever done? If so, what's the Ordinance? It should be referenced.

I17-989

**INADEQUACY OF DEIR RELATED TO FGMP:** As is the case in all instances with this DEIR, it does not, with regard to the FGMP area, provide a clear, quantified description of the direct or indirect impacts of the project, despite the fact that the project area is being slated for at least one huge development project (Yokohl Ranch: 10,000 houses, 30,000 people, golf courses, resort, large commercial area, many new roads, wastewater treatment plant, dam, reservoir, etc.) which is not even in a foothill development corridor, but which the DEIR states (p. 8-5) is being taken into consideration for the cumulative impacts discussion and analysis.

I17-990

The DEIR must provide non-generic, FGMP area-specific qualitative and quantitative analysis of impacts, including cumulative impacts, of the proposed project. The foothill area of the project differs substantially in many respects from the valley area of the project (slopes, drainages, wildlife, wildfire, wildland interface, running rivers, water supply, recreational opportunities, road types, etc.) and so requires analysis based on its own characteristics and how they affect and would be affected by the proposed project.

For example, in what areas and to what degree will the proposed project impact the existing visual identity and character of the FGMP area, which is one of the most scenic in the County? How many acres of agricultural lands will be urbanized under the proposed project in this area? How many additional VMTs will likely be generated, and what will be the impacts on air quality, including scenic vistas? What wildlife species, habitat areas, and migration areas will be impacted? How many acres and where? In what areas will the project impact how many known or likely cultural resource acres? How many acres of critical riparian areas and woodland will be impacted, and in what areas? Existing foothill communities and individual properties are experiencing significant problems with water supply and quality and with wastewater disposal; how will the proposed project impact these issues, including loss of groundwater recharge areas?

I17-991

The DEIR must also thoroughly discuss the direct, indirect, and cumulative impacts of permitting development outside of the FGMP's designated development corridors. Traffic and transportation impacts must be discussed and analyzed with the same thoroughness, especially quantifying the fiscal impact to the County of improving and maintaining foothill roads under the quantified proposed increases in traffic. It must also specifically assess the FGMP area project's impacts on global warming, and the impacts of global warming on the project, and discuss how the proposed project in the FGMP area will further Tulare County's compliance with the requirements of AB32. Discussion of excessive VMTs, loss of large-canopy trees and forest areas, quantification of additional acres of impermeable hardscape, etc. must be addressed in this evaluation.

I17-992

The DEIR must also qualitatively and quantitatively assess the adequacy and efficacy of the project's policies and mitigation and implementation measures as remedies to the adverse impacts described. It begs the question to simply describe all the impacts as "significant and unavoidable" without making an honest effort to relate to them the effects of the project's proposed remedies and to determine whether they should be strengthened or added to.

I17-993

The DEIR (p. 3-14) states that the FGMP applies to all lands designated Foothill Agriculture (FA, which has a 16—acre minimum parcel size, with maximum density of 1 DU/80 acres with one additional unit allowed for every 40 additional acres over 160). Please depict on the FGMP detailed map the areas that are zoned FA. How many acres are zoned FA? DEIR p. 6-3 refers repeatedly to "the Land Use Diagram." What Land Use Diagram? Where is it?

I17-994

## GOALS AND POLICIES REPORT:

I17-995

"Foothill Growth Management Plan" (GPR, Part II, p. 3-1): The penultimate sentence states that the FGMP "utilizes four development types that are geographically limited to two areas" outside Three Rivers and Springville. Please explain: What and where are these two areas, and how are they geographically limited?

"Development Corridors" (p. 3-1): The second sentence states that the development corridors are "designated on the Land Use Diagram." Where is the land use diagram? Please provide it and make it clear and comprehensive. It is referred to in each of the paragraphs on development types.

I17-996

This paragraph states that development corridors are designated as Foothill Mixed-Use. This FMU designation (GPR, p. 5-11) states that Maximum Density is 15.0 DU/Acre and Maximum Intensity is 0.25 FAR. But the Development Standards in the FGMP (1981; p. 38) state that "the residential density of a new development shall be initially limited by the amount of water available for domestic and fire fighting purposes based on water demand specifications provided by the Tulare County Health Department and the County Fire Warden. A more specific residential density shall be determined in the site plan review process. The final allowable density shall correspond to how well the proposed project meets the goals and policies of the FGMP. As a guideline, the maximum density for land with slopes between 15 percent and 29 percent shall be one residential unit per two and one half acres . . ." etc.

I17-997

So, which is it going to be, the standards in the original FGMP or new standards imposed by the GPU? The original FGMP was, in most respects, a resource-based document, which balanced locating development in the foothills with a recognition of the environmental constraints and values of this important region. The GPU, unfortunately, seems less concerned with recognizing these constraints and values.

218

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

**For adequate baseline and project impact analysis, please describe and map** the current conditions in the Foothill Area, including specifics on Development Corridors, such as their current and proposed (if different) acreage, their current and proposed populations, their current and proposed land usages, their current infrastructure (e.g., water and sewer systems, police and fire protection, etc.), the development corridors' major riparian areas designated as open space, the corridors' identified wildlife habitats, the corridors' sensitive wildlife areas designated as open space, the current and projected availability and quality (e.g., radon, nitrates) of water, etc.

I17-998

**Please correct** the text in Chapter 3, which oddly changes some of the original FGMP's words. **For example**, p. 3-2, top left column says the first level involves the "*demarcation*" of lands; the word was "*designation*" in the original (p. 3). On p. 3-3, third paragraph, the new text says the road system is designed to "*maintain*" the environmental hazards; the original (p. 5) says to "*minimize*" environmental hazards. New text p. 3-4, top right paragraph says "unless the property has been "*truly*" developed, while the original (p. 8) says "*duly*" developed.

I17-999

**Please explain:** On p. 3-4, top right paragraph, the new text says that when a preserve within a corridor is disestablished, "it must be zoned consistent with the requirements of the Williamson Act"; the original (p. 8) says "it should be immediately rezoned to the Planned Development-Foothill (PD-F) Zone."

I17-1,000

## 3.1 Foothill Growth Management Plan Policies

I17-1,001

**FGMP-1 (p. 3-6): Please explain** which goal this is in the original FGMP, referencing the page number. Page 3-6 of the new text suddenly departs from the format and organization of the original FGMP. **Please correlate each of the ensuing goals and policies to their location by page number in the original FGMP and make sure that they match.**

**For example, please correct FGMP-1.2 "Rural Agricultural Land Densities" (p. 3-6)**, which cites FGMP original p. 13, goal 3, policy 3-4. The referenced FGMP original policies deal with designing new development to preserve visual quality and not exceeding physical holding capacity, **not** with Rural Densities per se.

I17-1,002

**Furthermore, where in the original FGMP are 40 acre minimum parcel sizes required** if average slopes are 30 percent or greater, and minimums in excess of 40 acres on parcels with average slopes exceeding 35 percent? **Are these new policies in the UNCHANGED FGMP?** The FGMP does state on p. 15 #1 that "*environmentally sensitive areas within the development corridors . . . should be maintained as open space such as areas characterized by floodplains, steep slopes (30 percent or greater), "etc."*

I17-1,003

**FGMP-1.3 "Identity of Foothill Places" (p. 3-6)** has as its **Implementation Measure #1 (p. 3-13)**, which states that "The County shall concentrate rural and urban development in the development corridors." The

I17-1,004

219

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

original IM (p. 35 of the original FGMP) stated “. . . in the development corridors <i>only</i> .” Why was the final word “ <i>only</i> ” omitted, weakening this measure?	I17-1,004 cont'd
<b>FGMP-1.4 “Grading” (p. 3-6) has as its Implementation Measure #2 (p. 3-13),</b> which says that the County “shall amend <u>the</u> Tulare County’s Improvement Standards to reflect changes in foothill, street and grading standards.” Please omit the first “the” and remove the comma after “foothill.” This IM appears on p. 23 of the 1981 FGMP. The GPU timeframe for working on this IM is shown as 2010-2015. <b>Does this indicate that well over <u>30 years</u> can go by between the time that an Implementation is first approved as part of a plan and the time that it will actually be addressed? What standards apply in the meantime?</b>	I17-1,005
<b>FGMP-1.6 “Establish Citizens Advisory Committee (p. 3-6), Implementation Measure #5, p. 3-13:</b> Please correct “or” to “ <i>of</i> ” in this IM.	I17-1,006
<b>FGMP-1.7 “Preserving Visual Resources” (p. 3-6): Please explain why the language and meaning of the original FGMP has been changed in this policy.</b> The original (p. 13) says “New development <i>shall be designed</i> in a manner which preserves the visual quality of the foothill setting . . . .” The new, unimproved policy is no longer mandatory; now “The County shall <i>encourage</i> new development to be designed . . . .” The County has not kept its promise to not change the original FGMP. <b>Why has this important policy been weakened in the GPU?</b>	I17-1,007
<b>FGMP-1.8 “Commercial Neighborhood Centers” (pp. 3-6, 3-7): Please explain why this policy has been modified from the original (FGMP p. 13).</b> The original states that “neighborhood commercial centers shall be allowed in designated areas of the development corridor and <i>shall only include uses of a type and size to service a neighborhood . . . .</i> ” Why does the new policy eliminate key rural-character factors “ <i>type and size,</i> ” and substitute “ <i>shall only include land uses that provide neighborhood-related services?</i> ” <b>Please restore these factors.</b> The third bullet (FGMP-1.8, p. 3-7) provides another change. The original FGMP (p. 13 c) states that the “maximum size of the commercial center shall be <i>5 acres.</i> ” With no explanation, the GPU doubles the size, to “10 acres.” <b>Why was this change made? Why is it not indicated as a change from the original? What is the average acreage of neighborhood commercial centers in the foothills? Please restore the original.</b> The fourth bullet (FGMP-1.8, p. 3-7) is another change. The original FGMP (p. 13 d) states that “the commercial center may be <i>considered</i> as a part of a planned residential development, but the GPU says “the commercial center may be <i>included</i> as a part of a planned residential development.” Same comment as directly above. The fifth bullet (FGMP-1.8, p. 3-7) states in the original (p. 13 e) that “the center shall meet the policies and development standards of <i>the</i> FGMP,” while the new version states that “the center shall meet the policies . . . of <i>this</i> FGMP.” Thus, the FGMP in the GPU is differentiated from the original FGMP. It is NOT the original FGMP as advertised. <b>Where are the “development standards” in <u>this</u> FGMP?</b>	I17-1,008
<b>The original FGMP includes many pages of development standards. Please restore them in the GPU. (Page 23 of the original FGMP includes as an Implementation “Adopt by Ordinance the Foothill Development Standards</b>	I17-1,009
Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR	220

which are now included as a subsection of the Foothill Growth Management Plan.” Was this ever done? If so, what is the Ordinance, and why isn’t it discussed in this Chapter of the GPR?) | I17-1,009  
cont'd

Implementation Measure #7 (p. 3-13) is the only one shown for FGMP 1.8. Again, the new IM differs from the original (which is on p. 25 of the FGMP, not p. 26 as indicated in the new IM). The original states that “The Site Plan Review Committee *shall determine the consistency of the project with the location, type and design criteria of the policy*. Should the project not meet the intent of *the above policy*, findings . . . body.” The new IM says that the Committee “shall *review* the consistency of the project with the location, type *of* design criteria of the *County’s policies*. Should the project not meet *the County’s policies*, findings . . . body.” Why have these changes been made, apparently weakening the authority of the Review Committee and making vast and vague the focus of their review (the “County’s policies” vs. “the intent of the above policy”). Please correct this IM to conform to the original wording on p. 26 of the FGMP. | I17-1,010

FGMP-1.9 “Commercial Recreation” (p. 3-7): The original FGMP states (p. 14) that commercial recreation uses “*shall be located* in close proximity to unique natural features,” but the GPU says “The County *shall encourage* commercial recreation uses near unique natural features.” Why, again, has the FGMP been changed without explanation, and the mandatory rendered weak and unenforceable? Under this Policy also, “*the* FGMP” has been changed to “*this* FGMP.” | I17-1,011

Implementation Measure #7 (p. 3-13) is shown for FGMP-1.9. Please see and incorporate here the comments on IM #7 directly above for FGMP-1.9 (the reference to p. 26 in the original is correct for FGMP-1.9). | I17-1,012

FGMP-1.10 “Mobile Homes” (p. 3-7): The original (p. 14, #9) states that “Mobile home projects *shall be* located and designed,” but the GPU version says “The County *shall encourage* mobile home projects to locate and be designed . . .” Same comment as directly above. Why has the County’s position become so much weaker? No Implementation is shown in the GPU for this Policy. Why has the Implementation in the original (p. 27) been omitted (“The Site Plan Review Committee shall review mobile home parks and subdivisions to encourage designs that ‘fit’ into existing development patterns.”)? | I17-1,013

FGMP-1.11 “Light Industrial Uses” (p. 3-7): The original (p. 14, #10) states that “Light industrial uses (*as described in the Tulare County Zoning Ordinance*) *may be allowed* in a development corridor subject to a *conditional* use permit.” The GPU version says “The County *shall allow* light industrial uses in a development corridor subject to a *special* use permit.” Please explain why this policy has been changed; again, it reduces the County’s authority. No IM is shown in the GPU for this Policy. Why has the Implementation in the original (p. 27) been omitted from the GPU (“The *environmental impact report process* is the mechanism which will provide | I17-1,014

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

specific data both to the Site Plan Review Committee and the Planning Commission for purposes of determining a decision on the conditional use permit.”)?	I17-1,014 cont'd
<b>FGMP-1.12 “Development in Success Valley” (p. 3-7):</b> No Implementation Measure is shown for this Policy in the GPU. In the original FGMP (p. 29), the Implementation is “The two areas within Success Valley which are designated ‘Planned Development-Foothill’ on the Land Use/Circulation Plan for the Tule River Corridor shall be zoned to a classification which prohibits any residential densities greater than one unit per five acres.” <b>Please indicate whether this Implementation has been acted upon; what is this zoning classification? Please show these areas on a current baseline map for the foothill development corridors, included in the GPU documents.</b>	I17-1,015
<b>FGMP-1.13 “Hillside Development” (p. 3-7):</b> The original (p. 19, #1 AESTHETICS) states: “ <i>Hilltop</i> development shall be designed so as to preserve the skyline . . . .” The GPU version says: “The County shall require that <i>hillside</i> development be designed . . . .” <b>Please explain why this change was made and how the GPU FGMP will regulate hilltop development. No IM is shown for this Policy. Why has the original FGMP (p. 35) Implementation been omitted (“The design of subdivisions will be reviewed by the Site Plan Review Committee to assure the visual impact to the foothills is minimal.”)?</b>	I17-1,016
<b>FGMP-1.14 “Legally Conforming Commercial Uses” (p. 3-7):</b> The original (p. 12, #4) states that “Existing, legally conforming commercial uses . . . <i>may be recognized</i> with an appropriate use designation . . . consistent with other policies in <i>the</i> FGMP.” The GPU version says “The County <i>shall designate</i> existing, legally conforming . . . consistent with other policies in <i>this</i> FGMP.” Why has the onus been changed to the County? This Policy’s <b>Implementation Measure, #8 on p. 3-13</b> differs from the original (FGMP, p. 22), which says “Substantial improvement or expansion to <i>existing</i> zoned commercial uses . . . .” <b>Has “existing” been intentionally omitted in the GPU version?</b>	I17-1,017
<b>FGMP-2, under “Foothill Area Communities” (p. 3-8)</b> has added the <b>Badger Development Corridor</b> to the communities of Springville, Three Rivers, and Lemon Cove (original goal #1, p. 11). <b>Please explain why this change was made.</b>	I17-1,018
<b>FGMP-2.1 “Community Commercial Development” (P. 3-8):</b> The <b>Implementation Measure</b> for FGMP-2.1 (#9, p. 3-14) states, “The County shall ensure that the land use and circulation plan for a development corridor will <i>limit</i> retail commercial development designations outside Three Rivers, Springville, and Lemon Cove,” but the original FGMP (p. 22) states that the land use and circulation plan will “ <i>preclude</i> ” such development. <b>Please explain why this change was made.</b>	I17-1,019

**FGMP-2.2 “Badger Development Corridor” (p. 3-8):** No IM is shown for this Policy. **Are IMs #10 and #11 (p. 3-14) related to this Policy? How is this Policy related to FGMP-2.3? What are the “established land use patterns” in the Badger Development Corridor? Please see also and incorporate here by reference the comments under FGMP-3.1 below.** | 117-1,020

**FGMP-2.3 “Badger Density” (p. 3-8):** Why does the GPU depart from the original FGMP, which based new development on environmental factors such as water availability, soil, slope, vegetation, landmarks, watercourses, and other natural features? How was the 1 DU/5 acre maximum residential density determined for the Badger Development Corridor? No IM is shown for this Policy. **Are IMs #10 and #11 (p. 3-14) related to this Policy? Please see also and incorporate here by reference the comments under FGMP-3.1 below.** | 117-1,021

**FGMP-3.1 “Innovative Residential Design” (p. 3-8)** encourages innovative design such as planned unit or cluster development to conserve and preserve surrounding open space from unnecessary disturbances, but its **Implementation Measures (#10 and #11, p. 3-14)** apply only to the Badger Development Corridor and state that the County shall establish 5-acre minimum parcel size and “*shall initiate changes in this FGMP specifically for the Badger Development Corridor to accommodate uses of property and densities not presently reflected in this FGMP, so long as specific plans for development and densities have been prepared and are available for review at the time the Commission initiates consideration of the plan change.*” **Please explain and justify this radical departure** from the policies of the FGMP: What kind of “*uses of property*” and “*densities*?” Will there be noticed opportunities for public review of and input to these documents? What policies will govern these uses and densities? What is the demonstrated need for such abrogation of the FGMP? Will EIRs be required for these specific plans? **What would be the direct and reasonably foreseeable indirect effects of these changes? Why are there no timeframes for these IMs?** | 117-1,022

As for **IM #10 (p. 3-14)** and the 5-acre parcel size that this IM “would” establish, **how does this IM relate to FGMP-2.3 (p. 3-8)**, which states that the County shall limit the maximum residential density of areas [does this mean all areas?] within the Badger Development Corridor to one dwelling unit per five acres?” The reference under FGMP-2.3 indicates “Amendment 83-03; Implementation Measure I.” Does this indicate that the FGMP has already been amended, in 1983, to implement this 1 DU/5 acre policy? Or was the Amendment proposed but rejected? **Please explain. Please provide a clear, detailed baseline map of the foothill plan area and corridors and include correct, current land use designations and zoning.** | 117-1,023

**FGMP-3.2 “Excavation Operations” (p. 3-8):** Please explain why this policy has been changed from the FGMP (p. 14) original? The original requires a *conditional use permit*, but the GPU version requires a *mining permit*. The original describes procedures which mitigate “*environmental, social and economic impacts,*” but the GPU omits the social and economic impacts. **Please explain specifically how the IMs (#10, #11, and #12 on p. 3-14) designated for FGMP-3.2 relate to it. Why has the original Implementation (p. 27 of the FGMP) been omitted** | 117-1,024

223

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

<p>("The environmental impact report process is he mechanism which will provide specific data both to the Site Plan Review Committee and the Planning Commission for purposes of determining a decision on the conditional use permit.")?</p>	<p>I17-1,024 cont'd</p>
---	-----------------------------

<p><b>FGMP-4.1 "Identification of Environmentally Sensitive Areas" (p. 3-8):</b> Please explain why the original (p. 15) "<i>special wildlife habitats</i>" has been changed to "<i>habitat of special status species</i>" in the draft GPU. The IMs listed for this Policy (#13 and #14 on p. 3-14) relate only to visual impact and scenic corridors. <b>Please cite for this Policy IMs that relate directly to identifying and protecting environmentally sensitive areas</b> such as floodplains, steep slopes, unique sites, riparian woodland, wildlife habitat and corridors, etc. The original FGMP (p. 34) states that "Level III designates the <i>major riparian areas</i> of each development corridor as <i>open space</i>. Review of landscaping plans through the site plan review process will insure that areas to be landscaped are compatible with surrounding native vegetation. Level II of the FGMP identifies <i>wildlife habitats</i> in each development corridor. Level III of the FGMP <i>designates sensitive wildlife areas as open space</i> in each development corridor." <b>Where in the GPU documents does this information appear? Please include and it on a clear baseline map of the FGMP Area and its development corridors.</b></p>	<p>I17-1,025</p>
--	------------------

<p><b>FGMP-5.1 "Protect Agricultural Lands" (p. 3-9):</b> This Policy has no listed Implementation Measures and does not state how the County "shall maintain and preserve" foothill agricultural uses. The original FGMP (p. 15) lists three policies in support of this goal (including the use of large lot exclusive agricultural zoning, provision of adequate minimum parcel sizes through agricultural zones in the Zoning Ordinance, and limiting residential development densities in the PD-F areas of Success Valley). <b>Why have they been separated from the policy in the GPU version?</b></p>	<p>I17-1,026</p>
---	------------------

<p>The large-lot exclusive agricultural zoning policy of the original FGMP has been rewritten in the GPU as Implementation Measure #18 (p. 3-15), which references GPU Policy FGMP-6.1 ("Preservation of Scenic Highways"). <b>Why has this IM been rewritten so that it appears to weaken the original FGMP, which stated "<i>Protect . . . agricultural areas . . . from encroachment . . . through the use of . . . zoning</i>": the new IM says "rezone . . . agricultural areas . . . to <i>reduce</i> encroachment."</b></p> <p><b>Shouldn't IM #18 reference Policy FGMP-<u>5.1</u>?</b></p>	<p>I17-1,027</p>
---	------------------

<p>Page 29 of the original FGMP lists three Implementations for protecting the foothill agricultural areas through large lot, exclusive agricultural zoning. One of these now appears as <b>IM #19 (p. 3-15)</b>, also referencing Policy FGMP-6.1, which <b>should, presumably, be corrected to <u>5.1</u></b>.</p>	<p>I17-1,028</p>
--	------------------

<p>Likewise, <b>IM #16 (p. 3-14) should, presumably, be corrected to reference FGMP-<u>5.1</u></b>. Please explain why this IM has been rewritten and taken out of context from the original Implementation (p. 27), which stated that, <i>to support compliance with a common development or Specific Plan designed for an area within a definable geographic area of a development corridor</i>, "The County shall explore the legality of voluntary</p>	<p>I17-1,029</p>
--	------------------

224

contract cancellation on lands that are within a Development Corridor and under a Planned Development-Foothill Zone.”

I17-1,029  
cont'd

**Has this Implementation, adopted in 1981, never been acted on by the County?** Surely, after 25 years, the County has explored the legality of such cancellations, so what is the context for IM #16? Its Timeframe is 2007-2010, almost *30 years* from the date of the adoption of the original Implementation. **Please explain how the reader can rely on the efficacy of these Implementation Measures** when their originals have evidently not been carried out after three decades.

Likewise, **IM #17 (p. 3-14) should, presumably, be corrected to reference FGMP-5.1.** This IM shows a **Timeframe of 2007-2010.** Does this mean that the Implementation approved in 1981 to amend the Zoning Ordinance to add a zone to protect and maintain extensive agriculture **has never been carried out**, and may not occur until *30 years* after it was approved? Same comment as above on #16.

I17-1,030

**FGMP-6.2 “Identification of Scenic Highways” (p. 3-9):** No IM is listed for this important Policy; **please provide a concrete, measurable, enforceable one.** Page 30 of the original FGMP states that Level III of the FGMP provides for circulation patterns for each of the development corridors. Those *roads with unique visual qualities are shown as scenic highways.* Scenic highways and scenic roads are depicted on one of the maps enclosed in the FGMP. They include Hwy. 245, Hwy. 198 from north of Exeter through Three Rivers, M-296/J37 – Yokohl Drive/Balch Park Drive (from Hwy. 198 to Hwy. 190), J28 from near Springville to Strathmore, portions of Hwy. 190, Globe Drive near Springville, and J42/Success Drive. Almost *30 years* later, the GPU, in **GPR Figure 7.2-1**, which has been omitted from the January, 2008, version of the GPR, is depicting most of these routes (and some others) as “*Candidate* Scenic State Highways and *Candidate* County Scenic Routes.” **Please explain what the status is of this 1981 original Implementation and how it relates to GPR Policy SL-2.1 (p. 7-3) almost 30 years later.**

I17-1,031

**FGMP-6.3 “Development Along Scenic Highways” (p. 3-9):** Please provide an Implementation Measure for this Policy; **please correct “this FGMP” to the original “the FGMP.”** To which “development standards” is this Policy referring? Are there any development standards in the GPR FGMP specific to scenic highways and routes? The original FGMP (p. 44) includes six development standards specifically related to scenic highway corridor development (including standards for signs, utility improvement, grading, and vegetation and landforms). **Please include these as a minimum. Additionally, please include the original FGMP’s Implementation (p. 30)** that “The Site Plan Review Committee shall insure that the new development adjacent to scenic highways and roads meets the requirements set forth in the development standards.”

I17-1,032

**IM #6:** This Implementation, somewhat reworded, appears as **IM #6 (p. 3-13)**, but it lists only FGMP-1.6 ; **shouldn’t it reference FGMP-6.3?**

I17-1,033

IM #14 (p. 3-14) should also list FGMP-6.3; this IM is stated as a Policy in the original FGMP (p. 30), with an Implementation of "Design analysis of the project by the Site Plan Review Committee." Please restore the Site Plan Review Committee to the IMs for FGMP-6.3.	I17-1,034
FGMP-6.5 "Cluster Development " (p. 3-9): Please clarify this Policy and provide it with a concrete Implementation Measure. How will the County "encourage" cluster development?	I17-1,035
IM #20 (p. 3-15) promotes cluster development, greater setbacks, etc. to protect scenic corridors. Please correct its reference. It does NOT implement FGMP-7.1 (Historical Sites), but is related to FGMP-6.4 and FGMP 6.5.	I17-1,036
FGMP-7.1 "Inventory of Historical Sites" (p. 3-9): Please explain how almost <u>30 years</u> after the FGMP was adopted with a Policy (p. 30) to "Request the Tulare County Historical Society to inventory historical sites and buildings worthy of historical preservation," the GPU is including a Policy requesting the Historical Society to inventory these sites and buildings. Has the County ever made the request? Was this inventory ever prepared? Is this some sort of on-going activity? Please provide a concrete IM for this Policy, or some better mechanism for getting this inventory done.	I17-1,037
FGMP-7.2 "Preparation of an Archaeological Sensitivity Map" (p. 3-9): This Policy states that the County "shall prepare" this map. IM #23 (p. 3-15) states that <i>an archaeological sensitivity map has been prepared for Tulare County by the Anthropology Department, California State University, Fresno</i> . The original FGMP (p. 31) states as an Implementation exactly what IM #23 states. This map was created almost 30 years ago. Shouldn't it be updated, based on what's been learned in archaeology over the last 30 years?	I17-1,038
Please revise Policy FGMP-7.2, which is absurd in light of the fact that it was carried out almost thirty years ago. Please correct the references in IM #23; it should reference FGMP-7.1, 7.2, and 7.3, NOT 8.1, 8.2, and 8.3. Also please update the information in this IM to include at least references to current requirements of CEQA and SB18.	I17-1,039
FGMP-7.3 "Protection of Historical or Archaeological Sites" (p. 3-9): The original FGMP (p. 31) states as Implementation that "The site plan review process will insure that significant historical and archaeological sites will remain protected through provision <i>for open space easements</i> on such sites." Please explain why the wording is different in Policy FGMP-7.3.	I17-1,040
IM#15 (p. 3-14) must be corrected; it applies to FGMP-7.3, NOT to FGMP 5.3.	I17-1,041
We could continue in this vein through the rest of the FGMP Chapter, but surely the above suffices to show what must be done to correct and conform the GPR version to match the original, which it should do in intent, content, organization, goals, policies, and implementation measures.	I17-1,042

## APPENDIX A

## THE AHWAHNEE PRINCIPLES

I17-1,043

**Preamble:**

Existing patterns of urban and suburban development seriously impair our quality of life. The symptoms are: more congestion and air pollution resulting from our increased dependence on automobiles, the loss of precious open space, the need for costly improvements to roads and public services, the inequitable distribution of economic resources, and the loss of a sense of community. By drawing upon the best from the past and the present, we can, first, infill existing communities and, second, plan new communities that will more successfully serve the needs of those who live and work within them. Such planning should adhere to these fundamental principles:

**Community Principles:**

1. All planning should be in the form of complete and integrated communities containing housing, shops, work places, schools, parks and civic facilities essential to the daily life of the residents.
2. Community size should be designed so that housing, jobs, daily needs and other activities are within easy walking distance of each other.
3. As many activities as possible should be located within easy walking distance of transit stops.
4. A community should contain a diversity of housing types to enable citizens from a wide range of economic levels and age groups to live within its boundaries.
5. Businesses within the community should provide a range of job types for the community's residents.
6. The location and character of the community should be consistent with a larger transit network.
7. The community should have a center focus that combines commercial, civic, cultural and recreational uses.
8. The community should contain an ample supply of specialized open space in the form of squares, greens and parks whose frequent use is encouraged through placement and design.
9. Public spaces should be designed to encourage the attention and presence of people at all hours of the day and night.
10. Each community or cluster of communities should have a well-defined edge, such as agricultural greenbelts or wildlife corridors, permanently protected from development.
11. Streets, pedestrian paths and bike paths should contribute to a system of fully-connected and interesting routes to all destinations. Their design should encourage pedestrian and bicycle use by being small and spatially defined by buildings, trees and lighting; and by discouraging high speed traffic.
12. Wherever possible, the natural terrain, drainage, and vegetation of the community should be preserved with superior examples contained within parks or greenbelts.
13. The community design should help conserve resources and minimize waste.
14. Communities should provide for the efficient use of water through the use of natural drainage, drought tolerant landscaping and recycling.

15. The street orientation, the placement of buildings and the use of shading should contribute to the energy efficiency of the community.

I17-1,043  
cont'd

## **Regional Principles:**

1. The regional land use planning structure should be integrated within a larger transportation network built around transit rather than freeways.
2. Regions should be bounded by and provide a continuous system of greenbelt/wildlife corridors to be determined by natural conditions [the greenbelts can be agricultural].
3. Regional institutions and services (government, stadiums, museums, etc.) should be located in the urban core.
4. Materials and methods of construction should be specific to the region, exhibiting continuity of history and culture and compatibility with the climate to encourage the development of local character and community identity.

## **Implementation Strategy:**

1. The general plan should be updated to incorporate the above principles.
2. Rather than allowing developer-initiated, piecemeal development, local governments should take charge of the planning process. General plans should designate where new growth, infill or redevelopment will be allowed to occur.
3. Prior to any development, a specific plan should be prepared based on these planning principles. With the adoption of specific plans, complying projects could proceed with minimal delay.
4. Plans should be developed through an open process and participants in the process should be provided visual models of all planning proposals.

## **Our Recommendation:**

The Local Government Commission has now developed Ahwahnee Principles for Economic Development, for Water, and for Climate Change. These are on the website: [www.lgc.org](http://www.lgc.org). **Please incorporate them here by reference and make them a foundation of the GPU/RDEIR.**

I17-1,044

<p style="text-align: center;"><b>APPENDIX B</b></p> <p style="text-align: center;"><b>ADDITIONAL COMMENTS ON THE RDEIR ALTERNATIVES, RDEIR CHAPTER 4.0, p. 4-1 ff</b></p>	<p>I17-1,045</p>
<p><b>RDEIR p. 4-2, second paragraph</b>, “significant environmental impacts . . . to eliminate or reduce”:</p> <p>Fourth bullet: <b>Please add</b> to this “Loss of agricultural land <i>and open space</i>.”</p> <p>Seventh bullet: Thank you for adding the extremely important groundwater and water supply impacts.</p> <p><b>PLEASE ADD</b> as an eighth bullet: <b>Greenhouse gas emissions and global climate change impacts.</b></p>	<p>I17-1,046</p>
<p><b>Alternatives Selection Process (RDEIR p. 4-2): Please explain why this section has substantially changed the information regarding this process from the description in the 2008 DEIR and the August 2005 Tulare County General Plan Policy Alternatives newsletter</b> (as referenced on RDEIR p. 2-24 and p. 4-2). <b>The RDEIR’s description of the City-Centered Development Scenario leaves out important information</b> (e.g., “This approach would not ignore the needs of unincorporated communities, and would look at policy solutions to address housing, services, and infrastructure needs to meet future growth” “Key advantages of this scenario include . . .” etc.)</p> <p>The RDEIR states (p. 4-2) that “the population calculations reveal differences from the original 2005 assumptions.”</p> <p><b>What population calculations? What caused the differences, and where and how is this reflected?</b></p>	<p>I17-1,047</p>
<p>RDEIR p. 4-3 says that under the Rural Community Development Scenario, “<b>County land use decisions would promote development of new communities and the expansion of existing communities within the foothill areas. It is anticipated that this approach would require the implementation of a major infrastructure expansion program.</b>” This RDEIR language was taken from the <i>December 2004 Alternatives</i> document. But in the <i>August 2005 Policy Alternatives</i> document, <i>which is the one referenced in the RDEIR</i> (p. 18), the <b>Rural Communities Alternative</b> stated that it “<b>emphasizes growth in the eleven unincorporated communities that have or are expected to soon have an adopted Redevelopment project Area (RPA) and Community Plan. Key advantages for this scenario include the utilization of existing infrastructure, services, and community cooperation while also protecting agricultural lands and maintaining the rural character of the county.</b> . . . The distribution of future growth under this alternative is 25% of new population is directed to the 20 unincorporated communities. Of this amount 80 percent is targeted to the eleven unincorporated communities that have an adopted, or are expected to soon have adopted, a RPA and Community plan. Distribution of new population is based on each community’s share of total UAB/UDB population of the eleven communities in 2000. . . . The other 20 percent is allocated to the other nine communities based on each community’s percentage share of total UAB/UDB population of those nine communities in 2000. . . . <b>5 percent of new population is directed to other unincorporated areas (rural areas).</b>” This is a totally different description. <b>Please explain.</b> Likewise for the Proportional Growth and Transportation Corridors.</p>	<p>I17-1,048</p>

The GPU/RDEIR is very deficient because it never shows with any specificity where it intends to direct the GPU population increase within the unincorporated area. It does not show anything like the detail illustrated above from the 2005 document. The RDEIR shows only a gross difference between unincorporated and incorporated, but it never explains how the various Alternatives accomplish these differences, nor does it ever show specifically *into which places* in the unincorporated area the population will be directed under the various Alternatives. Nor does it ever present and analyze what has caused the variations in growth in the unincorporated places in, say, the last 10-20 years and indicate how those factors will continue or not to affect growth and development under the various Alternatives. To what extent were these outcomes caused by policies and implementation measures in the existing General Plan? **The RDEIR should be extensively revised to remedy these deficiencies.**

I17-1,049

For example, the recently adopted Tulare County Housing Element includes on p. 25 Table 3-B – Population Trend, which shows for a number of the unincorporated communities their 1990 and 2000 population, the numeric change, and the percentage change. It shows that Earlimart grew by 12%, Goshen by 1%, Ivanhoe by 36%, London by 13%, Pixley by 5%, Richgrove by 44%, Strathmore by 10%, Terra Bella by 26%, Tipton by 29%. (For a number of the communities not listed in these comments, no population figures were available for 1990 because they were not Census Designated Places at that time.)

I17-1,050

Many of these communities are on Highway 99 or 65, most have RDAs. The only community shown as losing population in this period was Poplar-Cotton Center, with a loss of 27% (it is an RDA). **Are all of these communities scheduled for growth and development under the RDEIR Alternatives? Do their wildly varying historical growth figures affect how growth and development will be apportioned to them under the various Alternatives? Do the Alternatives consider to varying degrees what effect location (e.g., on main highway or not, near tourist attraction or not, etc.) and current development aid status (e.g., RDA or not) should have on where population growth should be directed? Do the Alternatives consider to varying degrees existing infrastructure (e.g., water and sewer, sidewalks, paved roads, street lighting, stormwater management, etc.) and services (e.g., fire station, police station, schools, library, clinic, etc.) and employment opportunities in deciding where to direct growth in the unincorporated area?**

**The RDEIR should be revised to accurately present the various scenarios as they were described in the Policy Alternatives document (and/or to explain why it has changed their descriptions). It should also be revised to explain and illustrate how the various Alternatives actually work to direct growth and in what specific ways their outcomes would actually vary. It should show specifically what factors are considered in selecting places into which to direct growth under the various Alternatives. It should provide a recent history of growth in these places to show how they've been growing without the General Plan Update for comparison with how they would grow under the various Alternatives.**

I17-1,051

230

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

RDEIR p. 4-3 states that the alternative selection process “was conducted to incorporate stakeholder input (in the form of workshops).” In those workshops, the public’s priorities were very clear: clean air, clean and reliable water, preservation of agricultural and open space lands, a more diverse economy. This information has now been deleted from the GPU GPR and does not appear in the RDEIR. It does not seem to be the foundation of any of the Alternatives. **The RDEIR should be revised to include at least one Alternative that is designed to focus on achieving these priorities. That Alternative would also be the environmentally superior Alternative.**

117-1,052

Table 4-1 in the RDEIR (pp. 4-4 – 4-5) shows population percentages between Incorporated and Unincorporated for the different Alternatives. **Please explain why these percentages do not match those in the Policy Alternatives document and the same Table on p. 7-3 in the 2008 DEIR (in the RDEIR, the table keeps bumping up the percentage going to the Unincorporated area).**

117-1,053

In Table 4-1, Alternative 5 (Confined Growth) and Alternative 1 (No Project) implausibly end up with the *same* 26%/74% population split in 2030 (whereas the GPU and the other Alternatives end up with *higher* percents in the Unincorporated). In the Policy Alternatives document, *the City Centered Alternative produced the 26%/74% split.* **Please explain how and why the Confined Growth Alternative would produce the same results as the No Project Alternative.**

117-1,054

Table 4-2 – Summary of the Alternatives Ability to Meet the Proposed Project Objectives (RDEIR p. 4-5): **Please explain and illustrate how the “Yes” and “No” ratings were arrived at, since they appear to make no sense.** For example, as discussed above, presently (under “No Project” conditions), many of the unincorporated communities have been RDAs for over 20 years, and many of the unincorporated communities have been growing very rapidly. Presumably the RDA projects have helped to improve their quality of life and economic viability. But Table 4-2 says these objectives would not be met under the No Project Alternative (or the City-Centered Alternative, or, in the first case, the Confined Growth Alternative). **But what is the logic of this? Will the RDAs be discontinued? Will the populations decline? What are the specific factors that will change the ratings between Yes and No? What determines that the first Objective is the only one for which Alternative 5 rates a “No?”**

117-1,055

Also, Table 4-2 has as its 3<sup>rd</sup> Objective “Protect from urban encroachment . . . through the implementation of the Goals and Policies of the General Plan.” Understandably, this is marked “No” for the No Project Alternative. **Please explain why it is marked “No” for Alternative 4-Transportation Corridors.** Will the GPU Goals and Policies not apply to Alternative 4?

117-1,056

It is duly noted that Table 4-2 states that *Alternatives 3 and 4 will not avoid rural residential sprawl.*

117-1,057

**Table 4-3 – Summary of Impacts (RDEIR pp. 4-7 – 4-12):** This Table lists 61(unless we counted wrong) impacts. Except for a few plusses and minuses, the **Alternatives are all rated just the same in terms of their impacts** except for 3.11-5 (where Alternative 4 gets a worse rating).

I17-1,058

**This indicates that there must no substantial differences among the Alternatives, and certainly no Alternative that is clearly the environmentally superior Alternative. The Alternatives must be revised in order to present a clearly environmentally superior Alternative.** That Alternative would best serve the people’s priorities and would provide for the healthiest and most sustainable growth, which would also be best for the economy. It would also best meet the requirements of AB32, SB375, and the County’s Climate Action Plan.

**We strongly recommend that the Healthy Growth Alternative proposed in the April, 2008, comment letter from Tulare County Citizens for Responsible Growth be included as an Alternative.** It would clearly be the environmentally superior Alternative and would best meet the people’s priorities and the GPU objectives, as well as AB32 objectives, SB375 objectives, and the County’s Climate Action Plan objectives. (Of course, the 2010 GPR would have to be extensively revised in order for any of these objectives to be achieved.) The RDEIR’s Alternative 5 – Confined Growth Alternative is labeled in the RDEIR as the environmentally superior Alternative, and yet it, of course, in no way confines growth at all since it allows virtually unlimited exceptions for “extenuating circumstances,” including growth corridors and New Towns, rendering it meaningless unless it is almost completely revised. If it were changed to incorporate without exceptions the recommendations of the TCCRG-proposed Healthy Growth Alternative, then it could live up to its (currently extremely misleading) title.

I17-1,059

It’s good to see the new section on Energy and Global Climate Change in the list of impacts, since those impacts are so significant (although they’re mostly being listed as LTS). However, **the GPU/RDEIR substantially fails to address Global Climate Change in any meaningful way.** The RDEIR (p. 3.4-1 ff) provides regulatory background on global climate change, but very little directly applicable and relevant scientific information. It does not present the facts that galvanized State and Federal legislation. It does not assess and explain the GPU project’s impacts on GHG emissions (nor does it assess the effect of climate change on the project and its impacts), nor does it in any way meaningfully compare and explain the various Alternatives’ impacts.

I17-1,060

It does state (p. RDEIR 3.4-6) that “*local governments are ‘essential partners’ in the effort to reduce greenhouse gas emissions, and that they have ‘broad influence and, in some cases, exclusive jurisdiction’ over activities that contribute to green house emissions. Local governments may contribute to significant direct and indirect greenhouse gas emissions through their planning and permitting processes, local ordinances, outreach and education efforts, and municipal operations.* Many of the proposed measures to reduce greenhouse gas emissions *rely on local government actions.* The plan [CARB’s Scoping Plan, 2008] *encourages local governments to reduce greenhouse gas emissions by approximately 15 percent from current levels by 2020.*”

232

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

Nowhere does the GPU/RDEIR indicate whether or how it plans to address this reduction target. It lists recommended actions (Table 3.4-1, RDEIR p. 3.4-7), but does not show how the GPU or the other Alternatives respond to these actions. **RDEIR p. 3.4-10 quotes from OPR (2008):** “Mitigation measures . . . may include . . . alternative *project designs or locations that conserve energy and water, measures that reduce vehicle miles traveled by fossil-fueled vehicles, measures that contribute to established regional or programmatic mitigation strategies, and measures that sequester carbon* to offset the emissions from the project.” **The RDEIR never directly addresses or quantifies how the various Alternatives would implement and effect such mitigation measures.** **RDEIR p. 3.4-13** concludes that “*Tulare County’s regulatory and planning activities directly influence how, and to what extent, energy is used in the County.* Local regulations governing the design, construction and use of buildings affect operational energy needs. Transportation policy decisions directly affect petroleum-based fuel requirements.” Unfortunately, **the GPU/RDEIR never demonstrates any firm commitment, leadership, innovation, or concrete, specific, timely, required actions to reduce GHG emissions in the County, nor does it show any significant difference among the Alternatives’ effects in this regard.**

I17-1,060  
cont'd

Clearly, the GPU/RDEIR must be made to include an Alternative that is significantly superior in this highly important (perhaps most important) area. Again, we recommend that the County include and adopt a true **Healthy Growth Alternative**, such as the one recommended by Tulare County Citizens for Responsible Growth in their April, 2008, comment letter, and that TCCRG is recommending again in this GPU/RDEIR comment period. All of the Alternatives currently included in the RDEIR allow and promote unlimited sprawl development in New Towns (“planned communities”) and Regional and Urban Corridors. This is totally contrary to the measures recommended for reducing GHG emissions.

I17-1,061

On p. 3.4-14 ff, the RDEIR discusses the Environmental Setting, Greenhouse Gases, and Potential Effects of Global Climate Change and concludes (p. 3.4-25) that “implementation of the proposed project would result in *similar impacts to all geographic planning areas of the County.*” RDEIR p. 3.4-28 states that “Future development subsequent to the General Plan 2030 Update *would primarily occur in or adjacent to existing developed urban areas,*” within the CACUDBs, CACUABs, HDBs, PCAs, MSCs, and Development Corridors in the FGMP. **This soothing statement completely skips over the fact that growth-inducing New Towns (PCAs) such as the proposed Yokohl Ranch development of 10,000 houses and 29,000 residents, could be located apparently anywhere.** Indeed, the Yokohl Ranch development is not within or adjacent to any existing developed urban area, nor any of the other listed areas (except for a tiny piece in a Development Corridor). **Such development in no way allows** “for the logical extension and utilization of existing utilities, public services, and other amenities such as proximity to employment centers, commercial uses, and public transit” (RDEIR p. 3.4-27). Unless the GPU/RDEIR includes, and the County adopts, an Alternative that requires all new growth to occur

I17-1,062

within existing boundaries (which have plenty of room to accommodate “planned” communities of a size and scale necessary to accommodate growth in the County), the RDEIR’s assertion of “logical extension” is specious and false. | I17-1,062  
cont'd

**RDEIR p. 3.4-11** states that lead agencies are urged “to quantify, where possible, the GHG emissions of proposed projects.” Other qualitative factors may be used in significance determination, including “the extent to which the project may increase or reduce GHG emissions as compared to the existing environmental setting . . . , whether the emissions exceed a threshold of significance . . . and the extent to which the project complies with regulations or requirements adopted to implement a . . . plan for the reduction or mitigation of GHG emissions.” | I17-1,063

RDEIR Appendix E – Greenhouse Gas Emission Inventory provides an inventory of estimated GHG emissions for the unincorporated County for 2007 and projects the information to 2030. assuming adoption of the GPU. **It does not show what the projected emissions information would be under the various proposed Alternatives, and so fails to inform the reader of whether they are likely to produce significant differences in this important area.**

**RDEIR p. 3.4-32** asserts that “numerous policies” in the GPU/RDEIR “support Scoping Plan measures related to energy conservation and green building standards, regional transportation targets, water conservation, solid waste, and agriculture.” The RDEIR states on p. 3.4-32 that the County’s dairies/feedlots contribute about 60% of the GHG in the unincorporated County and concludes that this “is substantial and could conflict with the State’s ability to meet the AB32 goals.” As discussed in several places in these comments, the GPU/RDEIR’s failure to address the confined animal facilities operations in Tulare County renders it deficient and inadequate in almost every aspect, and it must be revised to remedy this enormous omission. Needless to say, **none of the Alternatives address the dairy/feedlot issues in any discernible or differentiating way.** | I17-1,064

The RDEIR concludes (p. 3.4-32), “In summary, the proposed project addresses the issue of climate change in a variety of ways that include adopting a land use plan that is consistent and supports Tulare County Regional Blueprint principles [see discussion above in these comments re this Blueprint] along with implementation of a variety of policies designed to reduce both mobile (i.e., supporting transportation alternatives to the motor vehicle) and stationary sources (i.e., supporting energy efficiency and conservation measures that exceed State Title 24 standards) of GHG emissions. Furthermore, the General Plan 2030 Update contains a number of policies that would implement or support the measures recommended by the Attorney General for addressing global warming in general plans (see Table 3.4-5 below)” (RDEIR p. 3.4-33). | I17-1,065

The impressive-looking Table 3.4-5 lists dozens of GPU/RDEIR policies and implementation measures. It is followed (RDEIR pp. 3.4-38 and 3.4-39) by **Required Additional Mitigating Policies and Implementation Measures**. Unfortunately, as pointed out in detailed discussion above of these policies and implementation measures, **virtually none of them will serve to avoid, mitigate, or implement reduction of GHG emissions or actually require any resource efficiencies beyond those required by law (although the County seems to be behind in getting those into ordinances).** This pattern typifies the GPU/RDEIR.

234

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

Furthermore, many of the Impact Statements have been significantly re-worded, to the point that the RDEIR should explain why the changes have been made.	I17-1,066
For example, under Agricultural Resources (RDEIR p. 4-7), impact 3.10-2 says, "The proposed project could conflict with the provisions of the Williamson Act contracts through early termination of active . . . contracts." This impact was labeled AG-2 in the 2008 DEIR (p. 7-5): "The GPU could <i>conflict with existing zoning for agricultural use</i> , or conflict with existing Williamson Act contracts" Please explain why "conflict with existing zoning for agricultural use" has been omitted from this impact, which definitely alters the meaning.	I17-1,067
For another example, the next impact in the RDEIR is "The proposed project would involve other land use conflicts between agricultural and urban uses." In the 2008 DEIR this was, "The GPU could involve other changes in the existing environment that, due to their location or nature, could result in conversion of Important Farmland to non-agricultural uses." Please explain why this impact has been substantially re-defined, providing a very different meaning for the impact.	I17-1,068
For another example: Impact 3.8-3 (RDEIR p. 4-9) states "Development under the proposed project could be located on a hazardous materials site." Why has the RDEIR deleted the following words from the 2008 DEIR: " <i>and as a result could create a significant hazard to the public or the environment?</i> "	I17-1,069
For another example: Impact 3.8-6 (RDEIR p. 4-9) says, "the proposed project could expose people or structures to a significant risk of loss, injury, or death involving wildland fires." Why has the RDEIR deleted the following words from the 2008 DEIR: " <i>where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?</i> "	I17-1,070
For another example: Impact 3.6-2 (RDEIR p. 4-10) says, "The proposed project would result in impacts to groundwater supply, recharge, and secondary impacts to groundwater resources." Why has the RDEIR deleted the following words from the 2008 DEIR: " <i>The GPU would have the potential in the long-term to deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table?</i> " There seems to be a pattern here of diminishing the description and effects of these impacts. Please restore the altered or eliminated information or explain satisfactorily why it is no longer applicable.	I17-1,071
Also, in the Public Facilities and Services Impacts section (RDEIR p. 4-11), you have omitted the impact labeled PFS-19 in the 2008 DEIR (p. 7-13): " <i>The GPU may require the construction or expansion of additional energy infrastructure facilities, the construction of which could cause significant environmental effects.</i> " Please include this impact in the RDEIR or explain satisfactorily why it is no longer applicable.	I17-1,072

235

Comments from Laurie and Greg Schwaller 05/27/10 on Tulare County Draft (issued 03/25/10) GPU/RDEIR

1. The DEIR **does not offer a reasonable range of Alternatives** – the actual range presented is too narrow, and all the Alternatives have many of the same problems and seem to all have the same impacts. | I17-1,073
2. None of the descriptions of the Alternatives **explain what will cause their different growth pattern outcomes**; all but the No-Project Alternative are **based on the same GPU/GPR**, so they are all guided by the same goals, policies, and implementation measures. **Why, then, will their outcomes differ** in terms of amount of population growth and location of population growth? **The RDEIR must explain clearly, with specific examples, how the different Alternatives will cause significantly different outcomes with substantial variances in meeting the project objectives.** | I17-1,074
3. The descriptions of the various alternatives are **too vague to enable a clear understanding of the difference in their mechanisms so as to evaluate whether they would actually create the outcomes described and to enable a clear understanding of the differences they would produce** (e.g., comparison of number of acres converted to urban uses, comparison of quantified VMT impact, comparison of cost to County for public services [police, fire, water supply, sewer, parks, etc.], so as to provide a sound basis for decision-making. The RDEIR should provide *specific examples of the difference in outcomes that would be created* by the various Alternatives. | I17-1,075
4. None of the descriptions of the Alternatives lay out the **effect of the Alternatives on global climate change impacts and their likelihood of furthering Tulare County’s compliance with AB32, SB375, the County’s Climate Action Plan, and other State and federal clean air requirements, nor the effect on air quality and public health**; much more specific projections are needed to enable valid comparisons and decision-making. Additionally, **the effects of global climate change on the projected growth patterns of the various Alternatives are not described; the RDEIR Alternatives should be revised to discuss this important information.** | I17-1,076
5. None of the Alternatives clearly present **any mitigation strategies** that would offset their impacts. *Before* any more agricultural or open space land is converted, the County should establish *and implement* an effective General Plan mitigation program, including, but not limited to, strategies such as transfer of development rights, mitigation banking, and incentives for continuing to maintain land use as agricultural or open space. The RDEIR should make clear how much land is likely to be converted under each Alternative and ensure that an appropriate mitigation plan with a ratio of at least 1:1 is in place to accommodate the maximum acreage involved. | I17-1,077
6. None of the Alternatives address the **desire or capacity** of the unincorporated communities and hamlets and MSCs (or other unincorporated areas that would be converted to “corridors”) **to accommodate substantial development**. What is the relative *carrying capacity* available under each of the Alternatives, and how is that factored into the various projections? | I17-1,078
7. None of the Alternatives address their effect on **diversification of the County’s economy**. The RDEIR should be revised to explain, with examples, specifically how the different Alternatives would produce different results in achieving this Goal. | I17-1,079
8. None of the Alternatives address in any detail their **impacts on water supplies and water quality**, despite the County’s impending water crisis. The descriptions only mention, in the most general way, potential impacts on groundwater recharge potential. None discuss the potential impacts of global climate change and reduction of | I17-1,080

available imported water supplies and groundwater on the County's ability to grow. Much more specific information is needed in order to meaningfully compare the Alternatives.	I17-1,081
9. <b>None of the Alternatives are sufficiently environmentally superior to offer a valid choice</b> for accomplishing that goal.	I17-1,082
10. None of the Alternatives provide a <b>cost/benefit analysis</b> of their proposal; such analysis should be provided for each, and then a comparison should be made; the County has major fiscal problems, so this information is important	I17-1,083
11. The Alternatives section should include <b>maps</b> reflecting the current development footprint, and then the location, and individual acreage increases and total acreage increases of the described development patterns, so that the Alternatives' impacts may be visually and numerically compared. The maps also must <b>indicate significant natural resource lands (high quality agricultural, riparian, wetlands, other significant and endangered habitats and waterways, groundwater recharge areas, etc., and the amount of loss in each of these areas) so that relative impacts on these irreplaceable resources c/b quantified and compared.</b>	I17-1,084
12. The various Alternatives raise different issues and contain different types of information so that they are <b>inconsistent and do not provide for meaningful across-the-board evaluation and comparison.</b> , why wouldn't this description be the same for all of them?	I17-1,085
13. All of the Alternatives should address the needs of all the existing unincorporated urbanizing areas.	I17-1,086
14. <b>All of the Alternatives except #1-No Project assume that all of the proposed policies and implementation measures contained in the GPU GPR w/b included as part of each Alternative. Unfortunately, the policies and implementation measures in the GPR are too often vague, weak, unclear, unmeasurable, or absent and so will not provide the strong and timely direction needed to protect and revitalize the County's economy, communities, and natural resources. For any hope of a sustainable future, at least one Alternative must be presented that would strengthen the GPR's policies and implementation measures to the point that they will actually produce positive change in the pattern, type, and quality of new development. Such an Alternative would also be the environmentally superior Alternative.</b>	I17-1,087
15. In the County's GP workshops, the public was strongly in favor of city-centered growth and did not want new towns or unnecessary loss of agricultural or open space lands, but none of the Alternatives focuses clearly and strongly enough on this goal, and they would be gutted anyway by the policies and implementation measures in the GPU GPR); the GPU GPR encourages development of new towns and new growth corridors, which are antithetical to compact, resource-efficient, city-centered growth. <b>At least one Alternative must be provided that would truly direct growth to within the boundaries of areas already urbanized that want and can support new development; such an Alternative must not be rendered meaningless by loopholes in itself and by policies and implementation measures too vague and weak to make it happen.</b>	I17-1,088
In summary, the Alternatives, as presented, are far too vague, are premised on assumptions that are not explained, are inconsistent in the points they address, are incomplete, do not offer a reasonable range of clearly differentiated alternatives, and therefore do not enable readers to logically compare the Alternatives, nor to select any of the Alternatives as likely to fulfill the people's priorities (and certainly not if the GPR is adopted without considerable	I17-1,089

revision.) For additional detailed comments on the various Alternatives, please see our comment letter submitted in April, 2008, which is attached and incorporated by reference herein.	I17-1,089 cont'd
This May, 2010, letter overrides any inconsistencies in that attachment (we have not, however, changed the GPU document page numbers, etc. in the 2008 comments to correspond to the re-numbering and re-arranging in the current version of the GPU/RDEIR).	I17-1,090
We urge that the GPU/RDEIR be revised throughout in order to provide a strong, effective Plan that will promote the health and sustainability of our economy, our communities, and our natural resources. We urge that the GPU/RDEIR be revised to include a truly reasonable range of Alternatives and at least one very clearly environmentally superior Alternative that will effectively serve to achieve the people's priorities, as discussed above.	I17-1,091
We urge that this Alternative be the <b>Healthy Growth Alternative</b> proposed in the April, 2008, comment letter from Tulare County Citizens for Responsible Growth, and being proposed again in that organization's May, 2010 comment letter. We urge the County to adopt that Alternative (or better).	I17-1,092
Thank you for considering and responding to our comments.	I17-1,093

Attention: David Bryant, Project Planner

Re: General Plan 2030 Update and Environmental Impact Report

Dear Mr. Bryant,

Having thoroughly digested the Re-Circulated Draft Environmental Impact Report for the General Plan 2030 Update, I am not sure whether to laugh or cry. But rather than throwing up my hands in despair at what this “Plan” would do to the Tulare County that I love, I’m taking time to share my concerns and suggestions as one of the growing number of voices calling for healthy, not cancerous, growth. | I18-1

To begin, the Final EIR must contain an alternative for consideration that will avoid or lessen all negative impacts that are identified under the current flawed plan as “significant unavoidable adverse impacts.” While it is true that an “anything goes” plan that contains no strict development boundaries will have extremely negative impacts to our air quality, water supply, traffic, farmland, wildlife, noise, scenery, etc. it is patently not true that these impacts are “unavoidable.” | I18-2

The point and possibility of a General Plan is actually to plan in a way that does indeed avoid – or at least greatly lessen – significant adverse impacts. Different communities make different choices. Portland is not Las Vegas. The former was one of the few places in the country where real estate values held steady during the recent economic crisis because of healthy, smart growth policies. The latter chose an “anything goes”, let-the-market-decide approach, which has caused a rather severe set of “significant adverse impacts” to homeowners and the local economy. The point is that planning choices had consequences in these cases, and will have consequences in Tulare County. The next DEIR or Final EIR must clarify that Tulare County is not forced to be victimized by unstoppable forces of sprawl and degradation – it is a choice, and as such those choices can be made in such a way that significant adverse impacts are indeed “avoided or substantially lessened.” | I18-3

The failure to include a true confined, healthy growth alternative with a strong land use framework that would actually make improvements from status quo conditions (some of the worst air quality in the country, overdrawn groundwater supplies, unacceptably high rates of asthma, worsening traffic, etc) is a failure of imagination, and a failure to consider the wishes of Tulare County residents and taxpayers. More to the point for this document, the failure to include a reasonable range of alternatives fails the most basic of CEQA requirements, and is itself grounds for invalidating the DEIR in its current form. | I18-4

The DEIR should be re-circulated again until it provides a truly reasonable range of alternatives. I heartily support a revised version of Alternative 5, as proposed by the Tulare County Citizens for Responsible Growth (the “Healthy Growth Alternative”) | I18-5

As it currently stands, each alternative could easily be interpreted in a way that produces the exact same, “market-driven” results. The fact that each alternative produces 36 “significant unavoidable adverse impacts” is evidence enough that the DEIR is doing little more than putting different shades of lipstick on a pig. The next Draft or Final EIR must provide justification for why an alternative with far fewer “significant unavoidable adverse impacts” was not put forth for consideration.

I18-5  
cont'd

Section 5.4 states that CEQA Guideline 15093 (a) “allows the decision-making agency to determine if the benefits of a project outweigh the unavoidable adverse impacts of implementing the project. The County can approve a project with unavoidable adverse impacts if it prepares and adopts a “statement of overriding conditions” setting forth the specific reasons for making such a judgement.”

I18-6

In anticipation of the Tulare County Board of Supervisors preparing just such a “statement of overriding conditions” to justify adoption of a plan for sprawl, the next DEIR or final FEIR should identify for decision-makers and Tulare County residents examples of the type of alleged benefits that would outweigh the collective impact of 36 significant (avoidable) adverse impacts such as:

- 3.1.5 – Create a new source of substantial light or glare
- 3.2.1 – Result in a substantial increase in traffic
- 3.3.2 – Result in a considerable increase in air pollutants
- 3.3-4 – Expose sensitive receptors to substantial pollutant concentrations that could affect public health
- 3.6.2 – Result in impacts to groundwater supply
- 3.10.1 – Result in substantial conversion of important farmland to non-agricultural uses
- 3.11.1 – Have a substantial adverse impact on wildlife movement opportunities, migratory corridors, or naïve wildlife nursery sites

It will take more than money and a handful of very happy sprawl developers to compensate for such extreme, altogether avoidable, wreckage.

Thank you for consideration of my comments, and thank you in advance for deciding to take a proactive stand for the well-being of the residents and life-supporting resources of Tulare County.

Sincerely yours,

James Seligman

RE: General Plan 2030 Update and Draft Environmental Impact Report (SCH No. 2006041162)

Dear Mr. Bryant:

Enclosed are comments on the Recirculated Draft EIR ("the RDEIR") and the Recirculated General Plan 2030 Update ("the GPU"). Because of the extraordinary size of the documents comprising the RDEIR and the revised/recirculated GPU, our comments focus primarily on the Foothill Growth Management Plan as it influences and is affected by the proposed drafts.

I19-1

We recognize the tremendous effort the County put into the process of creating the documents and appreciate the opportunity to comment on them. We also appreciate the County's decision to respond to the comments it received in response to the 2008 draft by revising and recirculating the revisions.

I19-2

Unfortunately, while some previously missing sections have been added, and some provisions have been improved, it is extremely disheartening to have discovered that despite hundreds of pages of comments submitted in response to the 2008 EIR and Draft General Plan Update – including from the Office of the Attorney General -- very little of substance has changed in the recirculated documents. There is still no real *plan* – development is still open-ended as to location, size (other than minimums), and standards. Much of what has been changed has been changed in the wrong direction – weakening existing measures that are intended to protect the environment and which contribute to Tulare County's attractiveness as a tourist destination.

The failure of the County to respond to the input of the public indicating our strong desire that the General Plan provide clear guidelines that will unambiguously protect the rural and agricultural lifestyle we cherish, the current GPU still leaves too much up to chance and "market forces." The vagueness of the GPU, no doubt designed to give the County maximum flexibility in future planning decisions, also denies the County knowable, reliable guidelines. The RDEIR, in attempting to evaluate the potential impacts that could result from implementation of the GPU, has been stymied – it is impossible to evaluate the impact of an invisible moving target.

Karen Bodner  
Michael Olecki  
Comments on Recirculated DEIR & GPU  
May 27, 2010

The RDEIR has also again provided an inadequate baseline from which it could reasonably forecast potential impacts of adopting and implementing the GPU, and against which progress could be measured. As a result, again the RDEIR doesn't adequately disclose or evaluate potential significant adverse environmental impacts and measures to avoid or mitigate them. And, once again, the RDEIR doesn't present a reasonable range of alternatives to the GPU, including one that is designed to achieve what the people want: focused growth in existing communities and their already-designated urban development zones. The Alternatives presented are virtually identical to the Alternatives presented in 2008. By continuing to incorporate all the proposed GPU's goals and policies into each "alternative" the RDEIR not only skewed the analyses but failed to comply with the requirements of the California Environmental Quality Act, which requires consideration of alternatives with their own set of policies, objectives and implementation measures.

I19-3

I19-4

An EIR is an informational document. Its purpose is to "consider a reasonable range of potentially feasible alternatives that will foster informed decision making and public participation." CEQA §15126.6(a). "The EIR shall include sufficient information about each alternative to allow *meaningful* evaluation, analysis and comparison with the proposed project." CEQA §15126.6(d) (emphasis added). This point is so important, the statute repeats it: "The range of feasible alternatives shall be selected *and discussed in a manner to foster meaningful public participation and informed decision making*." CEQA §15126.6(f). The discussion/analysis of the various "Alternatives" in the RDEIR is superficial, conclusory and speculative. It is also stunning in its repeated conclusions that the overall impacts of both the City Centered and "Confined" Growth alternatives would be "similar" to those of the proposed plan, even after acknowledging that the individual impacts would be less than the proposed plan's.<sup>1</sup>

1 It appears that instead of creating a real range of alternatives from which the County could choose an appropriate plan to guide development over the next twenty years, the County may instead have chosen a plan and then created slight variations on that plan solely to meet the statutory requirement of having considered a range of alternatives. On May 5, 2010, I requested access to and copies (to be identified after review) of the documents the County used in preparing the "City-Centered Growth" and "Confined Growth" Alternatives to the project; in evaluating and assessing the environmental impacts of the "City-Centered Growth" and "Confined Growth" Alternatives; to discuss and/or compare the environmental impacts of these Alternatives relative to each other or to those of the proposed project; and to recommend the adoption or non-adoption of any Alternative. While the Public Records Act require access to public documents to be prompt, on May 14, I received a letter from the County telling me that I would be contacted on May 21 regarding the County's "progress in gathering the information." On May 21, I received another letter, directing me only to the documents that had been posted on the County website (i.e., to copies of the very documents which had led to the request for background documents and publicity releases) and telling me that I would be contacted again on June 3, 2010 – a week after the close of the public comment period and almost a month after the County received the request -- for an update on the County's progress in gathering "any additional information." The County's delaying tactics suggest that there are no documents containing substantive evaluation or discussion of the various alternatives.

RE: General Plan 2030 Update and Draft Environmental Impact Report (SCH No. 2006041162)

Dear Mr. Bryant:

The following comments expand on and supplement those in the accompanying cover letter, regarding the Recirculated Tulare County General Plan 2030 Update and Recirculated Draft Environmental Impact Report<sup>1</sup>. Because the documents comprising the General Plan Update and the Revised Draft EIR are inseparable, these comments address all the related documents. Please consider the comments in the cover letter and this document together, and in response to both the RDEIR and the Recirculated GPU.

I19-6

## INTRODUCTION

### General Comments

An environmental impact report ("EIR") is an informational document, whose purpose is to provide public agencies and the public in general with detailed information on the effect which a proposed project is likely to have on the environment; to identify, and list, ways in which significant effects on the environment of such a project might be avoided or minimized; and to indicate alternatives to such a project. CEQA §§ 21061 and 21002.1<sup>2</sup> Its analysis should help local legislators select the most appropriate general plan alternative to adopt. To facilitate use of the EIR by the public and the reviewing agency, it should be organized and written in a manner that will be meaningful and useful to both decision makers and to the public. CEQA §21003. Each EIR is also required to include a summary of the proposed action and its consequences. CEQA§15123.

I19-7

---

<sup>1</sup> The documents are referred to hereafter as "GPU" or "General Plan" and "RDEIR", respectively. In addition, references to the GPU refer to the Goals and Policy Report.

<sup>2</sup> All citations to CEQA are to California Environmental Quality Act, Public Resources Code §§21000 - 21177; references or citations to the CEQA Guidelines are to California Code of Regulations, Title 14, Division 6, Chapter 3, Sections 15000-15387.

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

Most importantly, the EIR review process establishes an element of trust: as a result of a fair and accurate evaluation of the possible environmental impacts identified by the EIR, especially in the context of adoption of a foundational document such as a General Plan, the public may have confidence that they may rely on the goals and policies adopted actually being carried out. See e.g., *County of Inyo v. Yorty*, 32 Cal. App. 3d 795 (The EIR serves not only to protect the environment but also to demonstrate to the public that it is being protected.) Sadly, after an auspicious start, the manner in which the County subsequently carried out the Update process has severely undermined that trust.

I19-8

The Recirculated General Plan and associated RDEIR have adopted language consistent with “smart growth and neo-urban” approaches to planning, but it has not actually adopted those approaches substantively. Far too many of the policies and implementation measures are discretionary, with the result that future decisions may well not comport with the presumed intent of the goals and policies. Importantly, the GPU still does not reflect the frequently expressed desires of Tulare County residents regarding how they want development to proceed over the next 20 years - i.e., growth centered in or restricted to existing communities (whether incorporated cities or communities). In particular, Tulare residents consistently rejected the need for any new towns, whether planned or not. (To the extent the County wants to promote the standards associated with the proposed Planned Community Area, an appropriate means of accomplishing this would be to incorporate them into the overall building standards for new development. The GPU recognizes the LEED and LEED-ND standards at Part I, page 4-2, but has not required compliance with the standards. LU-7.15 and LU-7.16 are “implemented” by an implementation measure that merely requires the County to review and implement an implementation measure. Page 4-36.)

I19-9

The RDEIR – and the proposed draft General Plan Update – also contain a number of inconsistencies, omissions, inadequacies and misrepresentations. For instance, the Introduction “Updated Topics” section states that the County has developed “a land use/circulation diagram showing the location of all future growth areas proposed as part of the General Plan Update. Refer to Figure 2-2 in Chapter 2, Project Description.... This figure also identifies the Urban Development Boundaries within which future urban growth is expected to occur.” However, while Figure 2-2 (actually labeled “Land Use Diagram”) does generally depict areas designated as “development corridors,” it does not provide enough detail to determine the precise boundaries of those corridors. As a result, the environmental impact of development within those corridors – and especially the impact of developing the corridors to complete build-out – cannot be evaluated.

I19-10

Throughout the RDEIR and GPU, the terms “regional corridor,” “urban corridor,” “development corridor” and “Corridor” are used, in some cases apparently interchangeably. Please establish a clear and consistent usage so that the public will know exactly where the proposed corridor may be located.

I19-11

The RDEIR and GPU also use the terms “important agriculture” or “important agricultural” in connection with various land use contexts. It is unclear whether the term

I19-12

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

is being used in a general, English-language way, or whether the specific “Important Farmlands” is intended. Cattle ranching is an important component of the County’s agricultural economy; to the extent that grazing lands may not be considered “important” as the result of the County’s use of the undefined terms, this must be corrected to clarify that grazing lands are within the scope of “important agriculture” or “important agricultural” lands and uses.

I19-12  
cont'd

Population data included in the Existing Conditions section of the 2008 Background Report used data from a number of sources. Because “[p]rojected populations by both the DOF and the U.S. Census do not provide long term forecasts to 2025 ... [the DEIR remedied this] by using a straight line projection and continuing the compound growth rates from the previous five years (i.e., 2010 through 2015)”. 2008 Background Report at page 2-29. The Background Report circulated with the Recirculated RDEIR and GPU (which is not entitled as a revised report) says only that “Compound average growth rates for historic and projected growth rates were based on population data provided by DOF.” At page 2-29.

I19-13

Are these population projections based on the same data?

## Executive Summary

I19-14

CEQA requires each EIR to include a summary. “The summary shall identify (1) Each significant effect with proposed mitigation measures and alternatives that would reduce or avoid that effect; (2) areas of controversy known to the Lead Agency including issues raised by agencies and the public; and (3) issues to be resolved including the choice among alternatives and whether or how to mitigate the significant effects.” CEQA§15123.

The RDEIR’s Executive Summary fails to include a discussion of any of the alternatives that would reduce or avoid the environmental effects of the proposed project, either in the section identifying the effects or in the issues to be resolved. Nor does it identify areas of controversy, although the scope of comments submitted in response to the prior iteration of the RDEIR and Draft General Plan Update clearly indicate that there are several controversial aspects of the proposed project. Because the ultimate decision maker, in this case the Board of Supervisors, is likely to rely on the Executive Summary, the RDEIR’s failure to include even a mention of the various alternatives or areas of controversy is more than disturbing: **it suggests that the outcome of the Update process has been predetermined, that the County is simply going through the motions, and that public input will not be considered.**

Table ES-4 sets out impacts and mitigation measures, beginning with Impact 3.1-1. Table 4-3 in Alternatives comparing Impacts begins with Impact 3.1-3. Why were Impacts 3/1-1 and 3.1-2 omitted from the Alternatives table?

I19-15

Tables ES-4 and 3.4-4 identify Impact 3.4-2 as “The proposed project would not result in the wasteful, inefficient or unnecessary consumption of energy in the construction

I19-16

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

and operation of new buildings.” The text at page 3.4-29 in the RDEIR, which identifies the Impact itself, says “The proposed project could result in....” etc. Please correct this inconsistency. | I19-16  
cont'd

## Project Description

On page 2-5, the RDEIR identifies one of the objectives of the General Plan Update as “Allow existing and outdated agricultural facilities in rural areas to be retrofitted and used for new agricultural related businesses (including value added processing facilities) subject to specified criteria.” **Please identify where these criteria are set out.** | I19-17

The General Plan identifies this same Guiding Principle as “Allow existing and outdated agricultural facilities in rural areas to be retrofitted and used for new agricultural related businesses (*including non-agricultural uses*) if they provide employment. (emphasis added) As contained in the GPU, this principle is both internally inconsistent – non-agricultural uses are not new agriculture-related businesses – and inconsistent with the objective set out on page 2-5 of the RDEIR. Troublingly, the language used in the GPU would permit the transformation of existing – but not necessarily outdated – ag facilities to be converted into commercial uses that are incompatible with agriculture – such as party barns. **Please make the GPU language consistent with the language used in the RDEIR.** | I19-18

The RDEIR identifies as a Key Policy Change (or possibly just as Project Information) the following:

Provide clear criteria for when and how unincorporated communities and hamlets can grow. Communities would have to fulfill specific conditions for expansion as defined by the General Plan. The County would require that infrastructure exists before or be provided concurrent with the new development.

RDEIR at 2-14.

But of the policies in the Planning Framework that would carry out this key change, PF 1.3 merely requires the County to “encourage” land uses that benefit from urban services to locate within UDBs and HDBs – it does not require or limit the location of urban land uses. This policy is cross-referenced to PF 2.8. **Neither PF 1.3 nor PF 2.8 have an implementation measure. Neither one is therefore enforceable and thus they have no effect.** PF 1.3 also suggests that if the “encouragement” does not work, development outside the UDB/HDB will be permitted if infrastructure can be provided. The policy, as a result, is inconsistent with Policy PF 2.1 (County “shall limit” urban development to area within UDB) and does not ensure that growth only takes place in designated development areas. **To protect agricultural and open space lands, and to prevent urban sprawl, growth should be strictly limited to infill and development within strong development boundaries. Please provide clear, enforceable criteria to implement the policy.** | I19-19

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

PF-1.4 again only “encourages” location within UDBs and HDBs – and it also **has no implementation measure**. PF 1.6, which instructs the County to designate land uses consistent with the Land Use element and the various local plans has **no implementation measure**. | I19-20

PF-2.2 permits the County to modify a community UDB on request of a special district, the community, or apparently anyone else as part of a requested General Plan Amendment. This policy is inconsistent with and undermines PF-2.1. A UDB may also be expanded when 80% of the non-Williamson Act land within the UDB is developed. Stated another way, a community UDB may be expanded when 20% of the non-Williamson land is still available for development. The percentage should be increased to 90% or more. **See also comment above -- To protect agricultural and open space lands, to promote infill and to prevent sprawling urbanization, growth should be strictly limited to infill and development within strong development boundaries.** | I19-21

PF-2.7 requires development within UDBs without exception to meet an urban standard for development, including curbs, gutters, sidewalks, and community water and sewer systems. With respect, we suggest that imposing mandatory urban standards is inappropriate for some communities, and should be a decision left up to the community plan. Especially as concerns development in the foothills, imposition of urban-style development styles in all cases would be in many cases inconsistent with the character of the community (which would violate FGMP policy) and unwanted. | I19-22

PF-2.5 confuses the intent the GPU further by providing that if “one or more applicants” is willing to fund a community plan update, the County will work with the applicant to create a new plan. **Does this give a developer with deep pockets control over a community’s plan? What about collaborative partnerships with community members willing to participate/take on tasks without the funding component?** This policy also says “Requirements for new town development shall be utilized to guide such private/public joint planning efforts.” **What does this mean?** | I19-23

PF-3.2 corresponds to PF-2.2, as applied to hamlets. However, it also permits expansion of the HDB as part of a subdivision or specific plan proposal. **This extra flexibility is likely to make the HDB so flexible as to have no real effect, and should be removed.** The comments to PF-2.2 also apply here. | I19-24

Another Key Change identified at page 2-14 of the RDEIR is: Expand upon the existing new town policy. New criteria for evaluating proposals “would” include a fiscally neutral or positive impact on the County, an infrastructure Master Plan must be prepared, demonstrated access to water (**but not impact on supply?**) and the project “must strive” to have balanced mix of land uses. **What does this mean? Does this encompass requiring sufficient employment opportunities to prevent creation of bedroom communities?** | I19-25

CEQA requires that the project definition include the whole of an action that has the | I19-26

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

potential to harm the environment. The proposed location of an action is a key aspect of this definition, because it is frequently the site of the project which dictates the harm it may cause. See CEQA Guidelines §15378. The “Urban Development Boundaries” section of the Project Description “assumes that a majority of future growth will occur within the CACUDBs for the County’s cities and communities.” The assumption is unsupported by – and is in fact contradicted by – the policies of the GPU, which establish large new UDBs for 11 hamlets, which will be exempt from the provisions of the Rural Valley Lands Plan and the Foothill Growth Management Plan and their related building standards; propose an entirely new “regional growth corridor” concept to direct development along highways 65 and 99; and which greatly expand upon the existing “new town” policy by adding an entirely new “Planned Community Area” component.

I19-26  
cont'd

The locations of the regional growth corridors have not been established, but are simply expected to be adopted through “future amendments to the General Plan Land Use Designation Map.” RDEIR at 2-13. As a result, the impact of this entire planning framework is unknown and unknowable. Significantly, “lands within these corridors will also be exempt from the Rural Valley Lands Plan” to allow the County to “maximize the economic development potential of areas located along major transportation routes for uses such as industrial, regional retail, office parks, and highway commercial.” Id. **How does this significant new provision further the objective of protecting important agricultural resources and scenic natural lands? Limit rural urban sprawl? What will be permitted, and what impact will this “maximization” have on the County’s air quality, water needs and supply, etc?** The GPU also indicates that “interim policies would be established until regional growth corridor plans are adopted.” Why haven’t those interim policies been established in connection with the proposal to establish the corridors? Again, it is impossible to analyze even the preliminary impacts of the proposed corridors on the level of detail provided in this RDEIR.

Under the GPU, the County “may adopt corridor plans as: Urban Corridor Plans, located within urban boundaries such as Mooney Boulevard; Regional Growth Corridor Plans, located along major transportation routes outside urban boundaries; and Scenic Highway Corridor Plans, located along routes established or eligible as State Scenic Highways.” GPU Part I, page 2-1. **Developed Urban Corridor Plans are likely to conflict or with or interfere with orderly growth of the adjacent city or community. How will these Plans be coordinated with City or community plans? Why would the County even contemplate adopting a growth corridor to maximize the development potential for industrial, regional retail, office parks, and highway commercial uses along a scenic highway??** This is untenable. If the intent of the County is not to permit such uses along scenic highways and routes, it should include an appropriate restriction in the GPU. Without specific standards, *any* development may ultimately be permitted as compatible with the General Plan.

I19-27

The County has also “not yet” adopted any proposed boundaries for the large Planned Community Areas; there are no Planned Community Areas indicated at all either on the Land Use Map or in the text of the GPU and RDEIR. Where the new town policies, including the new planned community area policies, do not identify specific sites where

I19-28

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

<p>new towns can be built, or the projected size and scope of these new towns, but rather create guidelines that permit them to be built virtually anywhere in the county, those policies are insufficient to identify and analyze the impacts of adopting the draft General Plan.</p>	<p>I19-28 cont'd</p>
--	--------------------------

<p>The RDIER asserts that</p> <p style="padding-left: 40px;">Future development subsequent to the general Plan 2030 Update would primarily occur in or adjacent to existing developed urban areas, within the County Adopted City Urban Development Boundaries, County Adopted City Urban Area Boundaries, Hamlet Development Boundaries (HDBs), Planned Community Areas (PCAs), Mountain Service Centers (MSCs), and Development Corridors in the Foothill Growth Management Plan (FGMP). These land use patterns allow for the logical extension and utilization of exiting utilities, public services, and other amenities such as proximity to employment centers, commercial uses, and public transit. Such land use patterns reduce dependence on motor vehicles and allows [sic] for stronger public transportation systems and development of pedestrian and bicycle paths.”</p>	<p>I19-29</p>
--	---------------

RDEIR at 3.4-26 and 3.4-27.

We agree that development in or adjacent to existing developed urban areas is the way to go, for all the cited reasons. **But the proposed regional development corridors and PCAs that will facilitate the creation of entire new towns anywhere in the County are entirely contrary to the concept; they should be completely eliminated as possibilities.** Tulare County’s own consultants have calculated that there is absolutely no need for new towns, and the people of the County don’t want them. Please listen.

<p>Figure 2-2, Land Use Diagram, does not adequately disclose the County circulation system, as the only roadways shown are the state highways, none of which service the designated Development Corridors.</p>	<p>I19-30</p>
---	---------------

<p>Figure 2-3, the RVLP portion of the LU Diagram, which is intended to show the Regional Planning Framework Land Use Designations &amp; Boundaries, shows only gross outlines of UDBs, UABs &amp; HDBs - not enough detail to discern where the boundaries actually lie. While parcel-level detail is not required, the map must present a well-defined geographic area to assist in planning. This map also shows no Regional Corridors, and no Planned Community Zones are shown, which makes analysis of the impact those developments are likely to cause impossible. <b>The GPU should specify the areas in which regional corridors, new towns and Planned Community Areas may be considered to facilitate analysis of their impacts.</b> Or, preferably, new towns and PCAs should simply be removed from the GPU as inconsistent with the wishes and values of Tulare County’s citizens and other policies of the GPU.</p>	<p>I19-31</p>
---	---------------

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

## Environmental Analysis General comments

The text at page 3.1-5 indicates that designated candidate scenic highways and County scenic roads are shown on Figure 3.1-2, entitled Scenic Resources. Figure 3.1-2, however, does not identify any of the county-designated scenic roads or routes. (As scenic resources, the map shows only State Highways 190 and 198, and the Kern River (two branches). The majority of designated points on the map are historic markers – which is a good thing to have mapped, but they are not scenic resources.) **Please provide a map that fully documents the scenic resources of the County.**

I19-32

The text at page 3.1-5 also apparently intended to list designated candidate scenic highways and County scenic roads. **This information is missing.**

The preservation of views of the night sky has been identified as valuable to the community. RDEIR at 3.1-16. Yet the provisions adopted by the GPU do very little to recognize or implement protection of the night skies throughout the County. ERM 5.18, entitled “Night Sky Protection” only requires the County to “determine the best means by which to protect the visibility of the night sky” upon “demonstrated interest by a community, mountain service center, or hamlet.” And the sole Implementation Measure (ERM IM 40) for this policy says only “The County shall encourage and assist community service districts (CSD), or similar local entities to assume parkland acquisition, development, operations, and maintenance functions in established areas.” Which does not really implement the policy of protecting the night sky. **Please see the International Dark-Sky website, [www.darksky.org](http://www.darksky.org), for invaluable information on the effects of light pollution, ordinances adopted by other communities (of all sizes), lighting standards, and more. Tulare County should adopt and implement similar provisions to protect our night vistas.** (As more and more areas elsewhere become light-polluted, the clear, starry skies of Tulare County could become a tourist draw in their own right. Astronomers have conferences and conventions too....)

I19-33

The impact analysis in Chapter 3 is confusing. On page 3.1-26 the RDEIR assumes that some new development will result in changes to views in all portions of the County, but that a majority of anticipated development-related changes will take place in the unincorporated communities in the Valley. This is **inconsistent** with the County’s expectation that most new growth will take place within the incorporated cities. The Chapter goes on to observe that new development would alter the existing open space views from the unincorporated communities, and that even with the proposed GPU policies, the impact is considered potentially significant. On page 3.1-28, this same development is identified as significant. And then it concludes that after implantation of mitigation measures, the impact is now significant and unavoidable. **Please explain.**<sup>3</sup>

I19-34

---

3 Note: the RDEIR does not set out the threshold standards adopted by the County by which to measure the impact of the development discussed. As a result, it appears that the analysis has considered *any* development to have “significant and unavoidable” environmental

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

On page 3.1-31 the RDEIR notes that buildout of the project would create substantial new sources of light or glare and references policies LU-7.18 and LU-7.19 as designed to mitigate the impact. The GPU does not, however, take the proactive step of requiring specific shielding of light sources or any other specific steps to prevent light pollution. **Please see, again, the resources available at [www. Darksky.org](http://www.Darksky.org).** (See also comment re: LU-7.18 above.)

I19-35

## Analysis Comments

The RDEIR applies only token analyses to identify the possible environmental effects that could result from adoption of the proposed GPU, looking only to those policies consistent with the County's proposed plan (unless forced to do so by State or Federal law), and doing very little to identify (or rejecting without real analysis) new or innovative ways to avoid or mitigate the identified possible effects.

I19-36

For instance, the RDEIR concludes that the possibility that "proposed project could conflict with other applicable adopted land use plans" (Impact 3.1-2) is "less than significant," and maintains that no mitigation measures "beyond currently proposed general plan policies and implementation measures" are required. This is tantamount to saying that the County does not need to hold elections because it plans to adopt a plan that eliminates elections. The RDEIR can only conclude that the proposed plan does not conflict with long-standing policies of the Foothill Growth Management Plan and the Rural Valley Lands Plan because the proposed plan makes major changes to land uses, and how land use decisions may be made, under those plans. (Notably, the proposed plan seeks to exempt from each of those existing plans any developments within urban area boundaries).

The FGMP is cited in support of mitigation of environmental impacts throughout the RDEIR. In most cases, the cited provisions do not support the analysis.

I19-37

For example:

- **Impact 3.1-3 The proposed project would substantially degrade the existing visual character or quality of scenic resources or vistas.**

consequences. While some might agree with that assessment, it does not allow for realistic comparative evaluations of the various Alternatives required under CEQA: any development at all, in any location results in a finding of "significant and unavoidable." And as a further result, the RDEIR was able to justify not recommending or adopting either of the admittedly environmentally superior alternatives to the proposed project -- the City Centered and "Confined" Growth alternatives -- because the impacts in a few areas were considered "similar" to those of the proposed GPU. This even though the same analysis acknowledged that the impacts in virtually all other areas were less than those of the GPU.

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

<p>The RDEIR concludes that adopting the proposed General Plan Update will result in Impact 3.1-3 having a <b>Substantial and Unavoidable</b> effect under CEQA. The RDEIR then cites <b>FGMP Policies 1.7, 6.1 – 6.4 and Implementation Measure 13</b> as measures that will reduce or mitigate the anticipated Significant and Unavoidable impacts. However, FGMP Policy 1.7 <i>encourages</i> commercial recreation uses (and thus additional development, traffic, air pollution, etc. ) near natural features; Policy 6.1 purports to protect the visual qualities of State Highways 190 and 198 but doesn't apply to any other roads within the FGMP area, and Policy 6.2 requires the county to identify scenic roads but nothing more. Moreover Policy 6.2 <b>has no Implementation Measure</b> so the policy is not only unenforceable but will do nothing to mitigate the anticipated significant impact.</p>	<p>I19-37 cont'd</p>
<p>Policy 6.3 does require the county to require compliance with FGMP development standards BUT if, as the County states elsewhere, development will be directed to PCAs within the foothills, that development will be exempt from the critical resource- based Level III and Level IV review, which assesses the suitability of the proposed development for that particular site. <b>This undermines the foundation of the FGMP.</b></p>	<p>I19-38</p>
<p>Policy 6.4 applies only to development corridors, while the goal to which it is linked applies throughout the foothills. Under this Policy and its defective IM-14, only vistas within development corridors would be protected; the rest of the FGMP area is left uncovered.</p>	<p>I19-39</p>
<p>IM 13 deals only with development of new subdivisions (and then only requires that impairments be minimal), thus leaving open expansions or improvements to existing structures, and development other than subdivisions, which will also impact the scenic visual character of the foothills. IM 13 also simply requires subdivision plans to be “reviewed” by Site Plan Review – there are no guidelines, and no provision that directs the County to create and adopt measurable guidelines or any other means of evaluating visual impact of development (and experience is that the environment of development other than slope is not even asked about - most planners appear unfamiliar with the foothills). To make the IM even less reliable, the entire section in the current FGMP that establishes the FGMP Site Plan Review process has been eliminated from the revised FGMP.</p>	<p>I19-40</p>
<p>The EIR discussion of Impact 3.1-3 also cites <b>FGMP Policy 8.18</b> as a mitigation measure that will “ensure that hilltop development is designed to preserve the existing skyline and scenic panorama of the foothills,” and Policy 8.19 as encouraging preservation of unique scenic resources in the foothills. However, Policy 8.18 is itself inherently inconsistent -- any “hilltop” development will by definition change the skyline; it therefore cannot be considered a measure that will “preserve” it. To be effective, the policy should prohibit hilltop development.</p>	<p>I19-41</p>
<p><b>Cited Policy 8.19</b> is also weak as a mitigation measure – it “encourages”</p>	<p>I19-42</p>

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

maintenance and protection of unique open spaces, riparian woodlands, oak groves, rock formations and vistas but then relies on an even weaker IM that simply requires the general level of site plan review (again with no language that establishes or revises site plan review guidelines, methods or standards which could ensure identification and protection of the open spaces etc.). Moreover, the site plan review committee is not the final decision-maker – its recommendation simply gets "reported" to the unidentified "appropriate" decision maker.

I19-42  
cont'd

Although not cited or discussed in the text of Impact 3.1-3, the chart of Mitigation Policies and Implementation Measures on page 3.1-27 also cites **FGMP Policy 1.5**. This Policy "encourages" the use of curvilinear streets, vegetation reestablishment on cuts and fills, cluster development, and housing site locations that blend into the landscape rather than becoming a focal point, but again relies only on the unchanged site plan review process. More disturbingly, as newly revised in connection with the General Plan Update, the language of the existing FGMP policy (which is or was Goal 3 Policy 3), the mandatory language ("new development SHALL be designed ") has been replaced with the ineffective admonition to "encourage" new development to employ the cited design criteria. This does nothing to mitigate the impact of the proposed project and in fact makes the impact on scenic resources more likely than it would have been without the revision. The RDEIR fatalistically then concludes that "No additional technologically or economically feasible mitigation measures are currently available to reduce this impact to less than a significant level."

I19-43

- These same (above) policies and implementation measure are cited in the RDEIR in mitigation of **Impact 3.1-4 (The proposed project would substantially degrade the quality of scenic corridors or views from scenic roadways.) SU** and
- **Impact 3.1-5 (The proposed project would create a new source of substantial light or glare which would adversely affect day or nighttime views in the County.) SU**

I19-44

As pointed out above, the policies and IM are ineffective or counterproductive. Impacts 3.1-4 and 3.1-5 also cite **FGMP IM 14** as a mitigating measure. IM 14 requires the County to promote the use of cluster development, greater setback distances, landscaping, and innovative lot design to protect scenic corridors within the County, and to incorporate provisions for the use of these tools into the County's land development ordinances. The language of IM 14 would make a good policy, but it does not provide a measurable means of implementing the policies. In particular, insofar as Impact 3.1-5 is concerned none of the cited policies or Implementation Measures address light pollution or glare, nor do they address means of reducing light pollution or glare. The International Dark-Sky Association's website ([www.darksky.org](http://www.darksky.org)) contains a wealth of resources,

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

including ordinances adopted by other jurisdictions, that would aid the County in preparing, and implementing real measures to avoid these impacts. But since none of the policies cited in mitigation actually mitigate the identified impacts, the RDEIR could not conclude other than that the impact was significant and unavoidable.

I19-44  
cont'd

**On the basis of limited and conclusory analysis, the RDEIR concludes that as to Impacts 3.1-3 and 3.1-4, “No additional technologically feasible mitigation measures are currently available to reduce this impact to a less than significant level.”**

I19-45

**This conclusion is patently false. What if the County adopted an alternative General Plan, under which development was directed only to existing communities (cities, communities, hamlets) without exceptions and loopholes, and further directed only to within existing development boundaries? *The RDEIR identifies both the City-Centered Growth Alternative and the “Confined” Growth Alternative as superior to the proposed Plan, reducing the environmental impacts identified in Impacts 3.1-3, 4 and 5 – even with application of the same flawed policies and implementation measures used in the GPU.* Had either or both of these Alternatives been properly evaluated with alternative sets of principles, policies, standards and plans, and implementation measures as directed under the State Guidelines, an accurate assessment of the environmental impacts would have been attained – and would more than likely have shown the impacts reduced even further. If the County had considered a truly smart growth alternative, such as the one suggested by the Tulare County Citizens for Responsible Growth in its 2008 Comments, these Impacts would likely have been reduced even further -- perhaps even to Less Than Significant, which should be the goal of the Update process. Why did the County fail to consider a properly constituted range of alternatives?**

- **Impact 3.1-5 The proposed project would create a new source of substantial light or glare which would adversely affect day or nighttime views in the County. SU**

I19-46

The RDEIR rightly concludes that adopting the proposed plan will create a significant new source of substantial light pollution – there’s no way that plopping entire new towns – with their accompanying houses, stores, traffic, street lights, electric signage, billboards ,etc. -- in currently undeveloped, agricultural lands can fail to introduce light and glare to what are now dark sky areas. The “mitigation” measures identified by the RDEIR, however, are inadequate to realistically do any real mitigation. As cited in the RDEIR, LU-7.18 requires the County to “improve and maintain lighting only *in park and recreation facilities* to prevent light spillage on adjoining residential areas. **THERE IS NO POLICY LU-**

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

## 7.18 IN THE GOALS & POLICY REPORT.

I19-46  
cont'd

Assuming that the County can correct this deficiency, **what percentage of new light pollution is anticipated to come from park and recreation facilities, and how will this have any real, measurable effect on the overall increase in light levels created by new development?**

I19-47

The RDEIR also cites LU-7.19 as requiring the County to “ensure” that lighting in residential areas and along County roadways “shall be designed to prevent artificial lighting from reflecting into adjacent natural or open space areas unless required for public safety.” While this policy is much better, once again **THERE IS NO POLICY LU-7.19 IN THE GOALS & POLICY REPORT.**

I19-48

How can either of these nonexistent policies contribute to mitigation of a substantial environmental impact from lighting?

**Impact 3.2-1 (The proposed project would result in a substantial increase in vehicular traffic.)** is identified as also **Significant and Unavoidable**. The RDEIR once again concludes that **“No additional technologically feasible mitigation measures are currently available to reduce this impact to a less than significant level.”** And once again – what if the County adopted one of the reasonable and more effective Alternatives? **Both the City Centered and “Confined Growth” Alternatives are identified by the RDEIR as being environmentally superior, having lesser impacts. A truly smart/healthy growth policy – one without the loopholes and inconsistent elements built in to the Confined Growth alternative – is one stunningly evident mitigation measure the County could have adopted.**

I19-49

- **Impact 3.2-4 The proposed project could result in a substantial increase in public transit usage.**

I19-50

The RDEIR concedes that adoption of the proposed plan renders this effect **Less Than Significant. However, substantially increasing public transit usage is, in the context of this GPU, a good thing** – increased public transit usage will reduce VMT, decrease GHGs by reducing dependence on individual private vehicles, and improve our air quality. The fact that the proposed GPU will NOT have a significant impact on public transit usage is a result of the County’s refusal to adopt a healthy-growth alternative to the proposed GPU (even though two such proposals were submitted in response to the 2008 draft, and even though the County maintains that it did consider both a city-centered growth and what it labeled a “confined” growth alternative. As discussed elsewhere, because the County inappropriately assumed that the policies and implementation measures from its preferred plan would also be incorporated into any Alternative, its analyses of the Alternatives was skewed – and predictably, every plan gave the same result.

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

Had the County followed the State Guidelines, which direct the development of alternative sets of principles, policies, standards and plans, and even alternative implementation measures for each Alternative (see Guidelines at 43), more accurate measures of environmental impact would have been obtained. How could a plan that directed growth to existing cities and communities, where infrastructure including public transit already exists, and which promoted infill development and reduced distances between homes and destinations instead of encouraging the development of entirely new towns in currently undeveloped areas and “transportation corridors” – i.e., along highways -- *not* significantly increase public transit use??

I19-51

Impact 3.2-4 cites **FGMP Policy 8.16** (which “encourages” the concentration of development along major travel routes to allow for future public transportation services and minimize travel distances to frequently used facilities) as a mitigating policy that contributes to the County’s conclusion that the impact of the proposed GPU will be Less Than Significant. Because **Policy 8.16 has no Implementation Measure** it cannot be enforced. Its mitigation ability is therefore nil. Please also see comments on Policy 8.16, above.

I19-52

**Impact 3.3-1 (The proposed project could expose a variety of sensitive land uses to construction-related air quality emissions).**

I19-53

The RDEIR concludes that buildout of the GPU will have a **Less Than Significant** effect resulting from air quality emissions connected to construction. The RDEIR’s analysis, however, is significantly flawed. Equally flawed is the RDEIR’s conclusion that no mitigation measures “beyond currently proposed General Plan policies and Implementation Measures” are required.

Because buildout would occur in both incorporated cities and in unincorporated parts of the county, the RDEIR took the perplexing view that the incorporated cities are not part of the County; it considered *only* unincorporated County lands as the organizational boundary for the assessment. The RDEIR’s assessment therefore *did not include* emissions “associated with incorporated cities within Tulare County, even though emissions generated by that part of growth that is ultimately directed to the cities will inevitably impact the rest of the county (and the region as well.) RDEIR at 3.3-16. The RDEIR analysis completely fails to take any emissions from that development into account. **How can an analysis that excludes 80% of anticipated development cannot have realistically considered cumulative or indirect impacts?** Moreover, because under the proposed GPU, development may be permitted to create additional new towns, Planned Community Areas, Development Corridors in entirely unspecified areas, **how did the RDEIR assess the impact of those developments? How did it determine whether the new development would be located near sensitive land uses or not?** The only limitation on this growth in the unincorporated areas of the County are the minimum 200-acre size for PCAs!

I19-54

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

On an even more basic level, no real analysis of the anticipated impact of construction is possible because the GPU establishes no limits on construction, and does not delineate the locations where construction may occur. How do you know if sensitive land uses will be impacted when you don't know where the impacts will emanate from? | I19-55

The RDEIR claims that it has taken development projects/ General Plan Amendments and Initiatives approved for unincorporated areas of the County into consideration in evaluating the cumulative environmental impacts. But the analysis then concludes that "Construction activity that would occur over the next several years in accordance with the proposed project would cause *temporary, short-term* emissions of various air pollutants within all of the County's individual planning areas." RDEIR at 3.3-18. However, construction under the GPU is not limited to "the next several years" – the planning period extends over twenty years. Construction of just one project, the proposed new Yokohl Valley town of 10,000 houses, several golf courses, a ranch resort lodge enclave, and commercial center – along with the associated roads and infrastructure is expected to be completed over the course of 20 – 30 years.<sup>4</sup> This is not short term, and the emissions caused by construction in this otherwise dry valley over the course of 30 years cannot be considered "temporary". | I19-56

In apparent contradiction with the RDEIR's ultimate conclusion regarding this Impact, the analysis comments that "given the amount of development associated with implementation of the proposed project, **it is reasonable to assume that some large-scale construction activity would exceed SJVAPCD adopted thresholds over the next 21 years** and would potentially increase health risks associated with criteria pollutant exposure, such as lung irritation from ozone and mortality and morbidity from respirable particulate matter, during the temporary duration of construction." RDEIR at 3.3-18.<sup>5</sup> | I19-57

**How then, does the RDEIR reach the conclusion that the overall Impact is "less than significant"? How does a 21-year timespan amount to "temporary, short term" exposure?** |

---

4 See February 7, 2006 Staff Report GPI 05-011 – Request by the J.G. Boswell Company and the Eastlake Company to Allow the Filing of a General Plan Amendment to the Tulare County General Plan, Including the Foothill Growth Management Plan, at 4. | I19-56 cont'd

5 The RDEIR also confusingly discloses that "Impact statements provided in this section address the intent of the CEQA Guideline questions specific to the topic of air quality, yet are not taken verbatim from the Guidelines. Instead, impact statements have been tailored to fit the General Plan 2030 Update." **What does this mean?** | I19-57 cont'd

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

- **Impact 3.3.-2: The proposed project would result in a cumulatively considerable net increase of criteria air pollutants that result in a violation of an air quality standard.**

I19-58

For all the reasons set out in comments on 3.3-1 above, the RDEIR appropriately concludes that the likely impact of the proposed GPU on air quality is **Significant and Unavoidable**. As shown in Table 3.3-5 and explained at page 3.3-20, “future growth in accordance with the proposed project would exceed the SJVAPCD thresholds for ROG and PM10. These operational emissions would increase the potential to expose people to pollutant concentrations that exceed the health-based standards . . . that have been determined to result in health impacts, such as lung irritation from ozone and mortality and morbidity from respirable particulate matter.”

**The RDEIR’s conclusion that “No additional technologically or economically feasible mitigation measures are currently available to reduce this impact to less than significant level” is questionable at best.** The RDEIR indicates that the County recognizes that it must take some action to comply with Federal air quality regulations applicable to the entire San Joaquin Valley. But The RDEIR also recognizes that a significant source of air pollution in the County comes from dairy and feed lot operations. **Both of these activities may be regulated to significantly reduce the overall levels of pollutants.**

- **Impact 3.4-1 (The proposed project could result in the wasteful, inefficient, or unnecessary consumption of energy by residential, commercial, industrial, or public uses associated with increased demand due to anticipated population growth in the County), is considered “Less than Significant.”** Accordingly, the RDEIR also concludes that no mitigation is needed “beyond currently proposed General Plan policies and implementation measures.”

I19-59

One of the General Plan policies and implementation measures cited as leading to those conclusions is **FGMP Policy 8.16**. But because **Policy 8.16 has no Implementation Measure** it cannot be enforced and its mitigation ability is therefore nil.

I19-60

The RDEIR’s conclusion that the environmental buildout impact of the proposed GPU is “less than significant” and that no mitigation measures “beyond currently proposed General Plan policies and implementation measures” is astounding. The proposed GPU encourages extraordinary growth along highways, in Development Corridors, and in new “Planned Community Areas” which are subject to no existing land use or zoning restrictions. The County “has not yet” designated where these new minimum 200-acre developments will be located – so they may be located anywhere. **Without knowing where these new urban centers will be built, how many housing units will be included, whether there will be jobs in the new centers sufficient to employ the majority of the**

I19-61

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

**new residents so that the new town doesn't become a bedroom community whose residents will have to commute to the employment centers that already exist, whether there is a sufficient water source at the location so that energy isn't required to transport water from elsewhere, whether the new town will be able to provide all the services (health, fire, police, schools, libraries, sanitation, etc.) necessary to support urban living – without that kind of information, it is impossible for the County to have realistically assessed any environmental impact sufficient to conclude that the impact is negligible, as it has done here.**

I19-61  
cont'd

While the County has taken pains in this Revised GPU to disguise its preference to let “the market” direct development decisions, it has not abandoned it.<sup>6</sup> The County has already demonstrated its intentions to approve at least one huge, controversial, 36,000 acre PCA in the Foothill region that is (a) not within any designated development corridor, (b) will “overlap” the boundaries of both the Kaweah development corridor and the Round Valley development corridor, thus creating continuous development in one of the most scenic portions of the county, and (c) already inducing additional growth: RMA staff has already spoken with adjacent landowners to discuss development on those currently-agricultural properties.<sup>7</sup> There is no existing infrastructure in this area, nor is there public transportation that serves the area. Water will admittedly have to be brought in from elsewhere<sup>8</sup>, and the proposed housing will be part of an “active adult village” aimed at the affluent second- or vacation-home buyer (who will travel from and to their primary residences elsewhere in the state, thus adding to GHG emissions.) The proposal was given the green light despite substantial public input opposing the creation of any new towns in Tulare County at numerous visioning workshops held across the County early in the GPU process<sup>9</sup>, and despite the testimony of over 100 residents at a hearing on the proposal before the Board of Supervisors (including testimony asking the County to at least defer making a decision until after the General Plan Update had been completed).

I19-62

6 On page 3.3-16 of the RDEIR, the County acknowledges that “While buildout will ultimately be market driven, for modeling purposes this analysis is based on the assumption that most uses will be developed by the year 2030 . . . .”

7 See February 7, 2006 Staff Report GPI 05-011 – Request by the J.G. Boswell Company and the Eastlake Company to Allow the Filing of a General Plan Amendment to the Tulare County General Plan, Including the Foothill Growth Management Plan.

8 Water to support this massive development is expected to be taken from Lake Kaweah, the primary source of irrigation water used in the Valley. The RDEIR’s conclusion that the volume of water needed urban uses will actually be less than that used for agriculture is incomprehensible. How has the County accounted for year-round lawns and landscaping for the proposed houses, resort and golf courses, in addition to domestic uses? Is it realistic to conclude these uses will consume less water than the currently –un-irrigated grazing land??

9 See Policy Alternatives Newsletter, August 2005 at 4,5 (restrict development outside of UABs; direct more population growth to urban centers); visioning workshops, comments to 2008 Draft GPU, etc.

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

Because the County's actions speak more loudly than its words, it is entirely likely that more such new growth outside established UDBs and HDBs will be approved, which will indeed **"result in the wasteful, inefficient, or unnecessary consumption of energy by residential, commercial, industrial, or public uses associated with increased demand due to anticipated population growth in the County."** It simply is not credible to conclude that the growth-inducing Corridor and PCA policies of the GPU will result in a "less than substantial" environmental impact.<sup>10</sup> | I19-62

**See also previous comments on Policy 8.16, above.**

The RDEIR also cites **FGMP Policy 8.17** in support of its conclusion that the project's likely impact from Impact 3.4-1, wasteful, inefficient or unnecessary consumption of energy, is "less than significant." FGMP Policy 8.17 requires the County to "discourage" (**how**, exactly?) the scattering of development throughout the foothills to reduce vehicular emissions by decreasing home to destination distances. To implement this policy, the County is required to "concentrate rural and urban development in the development corridors delineated on a Master Development Plan." However, because Master Development Plans apply only in Planned Community Areas, and because the County has not delineated or identified the locations of any proposed Planned Community Areas, Planned Community Areas under this General Plan Update could be approved anywhere in the County. Under the proposed GPU, PCAs are not restricted to areas along public transit routes or even along major traffic thoroughfares (and in fact the one "planned community" that the County currently has pending is proposed for an area accessed via a minor, two-lane scenic road without regular public transportation routes). Further, because no Planned Community Areas have been designated, there are also no existing Master Development Plans and no designated development corridors. Neither this Policy nor the Implementation Measure can realistically be expected either to reduce vehicular emissions by decreasing home to destination distances or to mitigate wasteful energy usage. The conclusion that the anticipated impact of the GPU on inefficient or unnecessary consumption of energy is "less than significant" is unsupportable. | I19-63

Finally, **Impact 3.4-1** cites also **FGMP 3.1** (which "encourages" innovative design to preserve foothill open space) as mitigating the potential for wasteful energy use as the result of vehicle miles traveled. Because the IM associated with this Policy (IM – 7) does not implement the policy, **the policy itself is ineffective to mitigate Impact 3.4-1.** Moreover, while encouraging (or better, mandating) higher-density development is a step in the right direction, merely condensing the footprint of development will not necessarily reduce VMT – to effectively reduce VMT, development must be located near existing infrastructure and destinations | I19-64

---

<sup>10</sup> Another action undermining public faith in the reliability of planning documents: to find this proposed new town "consistent" with the FGMP, the staff report misrepresented the stated objectives of the FGMP and presented incomplete and/or inaccurate representations of FGMP provisions to support the developer's request. | I19-62 cont'd

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

<p>– jobs, shopping, etc. – as well as increasing density. Please also see comments on each of these FGMP policies, below.</p>	<p>I19-64 cont'd</p>
<ul style="list-style-type: none"> <li>• The EIR identifies <b>Impact 3.4-3 (The proposed project would potentially conflict with the State goal of reducing greenhouse gas emissions in California to 1990 levels by 2020, as set forth by the timetable established in AB32 California Global Warming Solutions Act of 2006.) as Significant and Unavoidable.</b> It maintains, however, that the draft GPU includes a number of policies, identified in Table 3.4-5) which would implement or support the measures recommended by the Attorney General (“AG”) to address global warming. Among the FGMP policies cited in Table 3.4-5 are:</li> </ul>	<p>I19-65</p>
<p><b><u>FGMP Policy 3.1</u></b> (cited in support of AG recommended measure “preserve existing conservation areas (e.g., forested areas, agricultural lands, wildlife habitat and corridors, wetlands, watersheds, and groundwater recharge areas) that provide carbon sequestration benefits” ) Policy 3.1 is unlikely to have the mitigating effect claimed, as the associated Implementation Measure applies only to those projects that require “only Site Plan Review” and even then, the Site Plan Review Committee only has the authority to “review” the proposed project. The Committee is not empowered to approve or disapprove the development. See comments regarding Policy 3.1 in chart below. Moreover, the section establishing the Site Plan Review process for the FGMP area has been deleted from this revised FGMP.</p>	<p>I19-66</p>
<p><b><u>FGMP 8.16</u></b> (cited in support of AG recommended measure “<b>Create an interconnected transportation system that allows a shift in travel from private passenger vehicles to alternative modes, including public transit ride sharing car sharing, bicycling and walking. Before funding transportation improvements that increase vehicle miles traveled, consider alternatives such as increasing public transit or improving bicycle or pedestrian travel routes.</b>”) Policy 8.16 is also cited in support of AG recommended measure “<b>provide adequate and affordable public transportation choices including expanded bus routes and service and other transit choices such as shuttles, light rail, and rail where feasible.</b>”  Policy 8.16 satisfies neither of these AG recommendations: it provides only that “The County shall encourage the concentration of development along major travel routes” – and then only “<i>to allow for future</i> public transportation services and minimize travel distances to frequently used facilities.” (emphasis provided) It in no way creates an interconnected transportation system or promotes a shift from private passenger vehicles to any form of alternative transportation. In addition the policy ’s weak direction to “encourage” development along major travel routes to “allow for future” transportation services does not provide adequate and affordable transportation choices – it merely hopes that such transit services and choices will somehow happen sometime in the future and in</p>	<p>I19-67</p>

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

the meantime makes the development attractive as a commuter community. (And as noted in chart below, **Policy 8.16 has no Implementation Measure** and thus cannot be enforced or expected to have any impact at all. A policy that truly addressed the concerns raised by the Attorney General would specifically provide for expanded public transportation options and routes. The GPU's emphasis on development in the unincorporated areas of the County, especially in the foothills, is also inherently incompatible with the goal of shifting transportation from vehicles to bicycles – the foothills of the Sierras are.... *hills*. Residents of these new developments are not likely to commute the long distances from the remote new development to the cities where most non-agricultural employment is and will be located by bicycle. By comparison, under the City Centered or "Confined" Growth Alternatives, the preferred infill development would take place primarily on nice, flat ground, and within a reasonable bicycle ride of employment and shopping.

I19-67

**FGMP Policy 8.16 and 8.17** (cited in support of AG recommended measure "**Concentrate mixed use, and medium to higher density residential development in areas near jobs, transit routes, schools shopping areas and recreation.**")

I19-68

Policy 8.16 encourages concentration of development along major travel routes, but is silent as to requiring that development be located near jobs, transit routes (other than roadways), schools, shopping areas or recreation. And as noted in chart, above, since there is **no Implementation Measure for Policy 8.16**, there can be no expectation that the policy will be enforced or have any effect.

FGMP Policy 8.17 requires the County to "discourage" (**how, exactly?**) the scattering of development throughout the foothills to reduce vehicular emissions by decreasing home to destination distances. To implement this policy, the County is required to "concentrate rural and urban development in the development corridors delineated on a Master Development Plan." While Policy 8.17 expresses the hope that emissions will be reduced by decreasing home to destination distances, because it is limited in application to Master Development Plans (and thus to Planned Community Areas) and because Planned Community Areas may be located anywhere in the County under the Draft GPU, it is impossible to conclude that this policy will locate higher density development near jobs, transit routes, etc. (It is also impossible to conclude that every resident of a Planned Community Area will be employed within that same Area, so the fact that a Planned Community will include some designated commercial or retail space does not respond to the AG's recommendation. In light of the location of the first, all-but-officially-approved PCA in the Foothills, well away from any infrastructure at all, it is hard to imagine how Policy 8.17 supports the AG's recommendation.) Please also see comments re: Policy 8.16, above.

I19-69

**FGMP Policy 8.9** is cited in support of AG recommended measure "**Preserve forested areas, agricultural lands, wildlife habitat and corridors, wetlands, watersheds, groundwater recharge areas and other open space that provide carbon sequestration benefits.**"

I19-70

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

FGMP Policy 8.9 restricts the removal of natural vegetation, except for wildland fire prevention purposes. However, **Policy 8.9 has no Implementation Measure** and thus is mere wishful thinking. It cannot be enforced and can have no expected mitigating impact. Please see further comments on Policy 8.9 in chart, below. Once again, the devil is in the details -- the analysis done to assess the environmental impact adoption of the proposed GPU will have is unreliable.

I19-70  
cont'd

**FGMP 8.12** (cited in support of AG recommended measure “**Protect existing trees and encourage the planting of new trees. Adopt a tree protection and replacement ordinance, e.g., requiring that trees larger than a specified diameter that area removed to accommodate development must be replaced at a set ratio.**”)

I19-71

FGMP 8.12 prohibits “unnecessary removal of native trees on development sites prior to approval of development” but depends only on the Site Plan Review Committee – which has no direction to even inquire about tree locations or removals and which does not have the authority to approve or deny a development proposal -- for implementation. The policy does not meet the standard recommended by the Attorney General, because (1) it is unnecessarily limited to removal of trees “prior to approval of development plans” and thus does not really protect native trees at all. Trees are routinely removed before permits are applied for even though this policy has been in effect since 1981. (2) Since there is also no requirement that development plans not be approved if they require removal of native trees, or to require mitigation if trees must be removed, the policy is ineffective to protect trees as part of Site Plan Review. (3) Who determines what is “unnecessary” and how? Moreover, the section establishing the Site Plan Review process for the FGMP area has been deleted from this revised FGMP – it simply doesn’t exist.

The County has been urged to adopt an ordinance to protect native trees for several years, without success. Numerous examples of ordinances have been provided to the County and various organizations have volunteered to assist the County in drafting an appropriate ordinance. The Planning Commission directed RMA to re-open its files on a tree ordinance over a year and a half ago. **Why doesn’t the Draft GPU include a real, viable, enforceable tree ordinance ??** Please also see comments on Policy 8.12 in chart, below.

**FGMP 8.3 & 8.15** (cited in support of AG recommended measure “**Address expected effects of climate change that may impact public safety, including increased risk of wildfires, flooding and sea level rise, salt water intrusion; and health effects of increased heat and ozone, through appropriate policies and programs.**”)

I19-72

FGMP 8.3 requires the County to prohibit development of residences or permanent structures within the 100-year floodway; FGMP 8.15 restricts development in chaparral areas. However, **neither FGMP 8.3 nor 8.15 have any Implementation Measures** at all. These policies are inadequate under the State Guidelines, which require every policy to have at least one Implementation

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

Measure – and neither therefore effectively addresses the concerns raised by the Attorney General. | I19-72  
cont'd

- **Impact 3.6-1 (The proposed project could violate water quality standards or waste discharge requirements, or otherwise degrade water quality)** cites FGMP 8.6 in support of the EIR’s conclusion that policies implemented under the draft GPU render the potential impact **less than significant**. The policy is described as identifying a water source that should be protected from water quality impacts. | I19-73

FGMP 8.6 and its implementation measure (see chart, below) require drainage plans for development in the Frazier Valley watershed to avoid aggravating downstream flooding – thus, this policy does nothing to protect water quality in the rest of the Foothill area.

This Impact is supposedly also mitigated by the policies implementing new towns and PCAs, PF-.2. **There is no Implementation Measure for PF-5.2! Thus all the supposed “criteria” to be used in evaluating new town proposals are meaningless.** | I19-74

- **Impact 3.6-2 (The proposed project would result in impacts to the groundwater supply, recharge and secondary impacts to groundwater resources)** is deemed **Significant and Unavoidable**; The RDEIR concludes that **no additional technologically or economically feasible mitigation measures are currently available to reduce this impact to a less than significant level.** | I19-75

The primary recharge area in the County is the foothill agricultural land, which the County consistently devalues as “of lesser value” than the intensely cultivated agricultural lands in the Valley, and into which the GPU directs extended development. Expanding the lands open to urban development in the foothill areas, as promoted by the proposed GPU<sup>11</sup>, will inevitably impact the groundwater supply on which most of the County, including the Valley agriculture and cities, depend upon. **How can this level of conversion be less than significant? Why does the RDEIR not recognize that at least two of the Alternatives to the proposed plan are indeed technologically and economically feasible measures that will reduce the impact of urban development in unincorporated areas of the County, and that an even more effective alternative was proposed to the County in Comments submitted in 2008?**

FGMP Implementation Measure 33 is cited in **Impact 3.6-4** as one of the supporting “policies designed to minimize water quality impacts associated with | I19-76

---

<sup>11</sup> Once again, the green-lighted proposal to develop in Yokohl Valley is the poster child for “market-driven” development that will have significant environmental impacts that could be avoided through the adoption of a responsible growth plan. | I19-75

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

stormwater, water and wastewater utility infrastructure needed to serve existing and planned urban areas". FGMP IM-33 reads "The Planning Commission and the Board of Supervisors shall consider the financing plan during their review and consideration of the specific plan, Master Development Plan, or Area Development Plan. **The financing plan** shall be used as a basis for establishing programs and standards within the specific plan, Master Development Plan, or Area Development Plan which mitigate or avoid the adverse **fiscal** impact of development upon local public service agencies and County agencies." (emphasis added)  
FGMP IM-33 minimizes the economic effect of development on the County, but does not minimize water quality impacts.

I19-76  
cont'd

- **Impact 3.6-3 (The proposed project could substantially alter the existing drainage pattern of the area, including through the alteration of the course of a stream or river in a manner which would result in substantial erosion or siltation on- or off-site or substantially increase the rate or amount of surface runoff in a manner which would result in on- or off-site flooding.)**

I19-77

The RDEIR has assessed this likely impact as "**less than significant**" and concludes that **no additional mitigation measures are required beyond the policies in the proposed GPU**. Given the substantial amount of development in areas that are now completely undeveloped under the proposed GPU, and the County's demonstrated willingness to permit developments in which the courses of at least one stream is contemplated, the RDEIR's conclusion that the impact is "less than significant" is suspect. In addition, many of the policies and implementation measures cited as mitigating the potential impact are ineffective.

Among the policies cited as supporting the RDEIR's conclusions are FGMP Policies 8.2; 8.7; 8.8; and 8.12. Policy 8.7 encourages cluster development, narrower road widths, minimized cut and fill projects to minimize soil disturbances, and new roads in the foothills that should, whenever possible, conform to the natural contours of the existing foothill landscape. The Implementation Measures associated with Policy 8.7 do not, however, implement the policy: IM-3 deals only with grading and stabilization of slopes greater than 15 percent; IM-14 requires the County to promote the use of cluster development, greater setback distances, landscaping, and innovative lot design to protect scenic corridors; and IM-25 requires developers to phase road construction to correspond with the phases of the development proposal. None of these policies address alteration of drainage patterns. **They do not, therefore properly contribute to mitigation of the identified impact, or to a finding that the potential impact is less than significant and that no additional mitigation measures are required.**

I19-78

Policy 8.8 does require erosion mitigation in new development projects, but the Implementation Measure associated with the policy is limited to development on slopes greater than 15%. Policy 8.8 itself is therefore inadequate, and cannot

I19-79

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

have contributed to a finding of “less than significant.”

I19-79  
cont'd

Policy 8.12 prohibits the unnecessary removal of trees from a site prior to approval of development plans but does not prohibit removal of trees during site plan review or after plans have been approved, nor does it require mitigation. Even if preservation of trees (which could indeed minimize soil erosion thereby reducing surface runoff) were an enforceable policy under the FGMP (or any other County policy), merely prohibiting removal of trees prior to plan approval will not do so. Please see also the comments on the FGMP policies and IMs themselves in the chart, below.

I19-80

- Impact 3.7-1 (**The proposed project could result in substantial soil erosion or the loss of topsoil**) is identified as “**less than significant**”. Policies contributing to this finding include FGMP Policies 1.11; 4.1; 8.2; 8.7; 8.8, 8.10; 8.11; 8.12 and 9.4, which the EIR says were “developed to address a variety of environmental issues (including soil erosion). . . . With implementation of [these policies] and implementation measures, this impact is considered **less than significant**.” (emphasis in original).

I19-81

FGMP 1.11 deals with the visual impact to the skyline from hilltop development, policies 4.1 and 8.10 have no Implementation Measures; 8.7, 8.8 and 8.12 are discussed above; 8.11 prohibits development on slopes of 30% or greater *unless* the developer can mitigate the problems inherent in building on slopes. None of these measures would mitigate the impact on soil erosion or loss of topsoil resulting from implementation of the draft General Plan Update. Similarly, the Implementation Measures cited in the analysis of Impact 3.7-1 -- IMs 7, 14 and 33 – do not mitigate. IM 7 simply requires site plan review for projects “that only require site plan review”; IM 14 promotes cluster development and other design tools to preserve scenic quality, and IM 33 protects the County from fiscal consequences resulting from development projects that require additional infrastructure. They do not mitigate the potential for substantial soil erosion or the loss of topsoil should the draft GPU be implemented. **The RDEIR’S conclusion that no mitigation measures beyond those policies included in the proposed GPU are required is inaccurate and insufficient.**

- In discussing **Impact 3.8-6 (The proposed project could expose people or structures to a significant risk of loss, injury, or death involving wildland fires.)**, the RDEIR states at page 3.8-34 that FGMP Policies 10.2 and 10.3 “provide requirements regarding fire safety and building standards for new development.” **Neither of these policies has an Implementation Measure.** Without Implementation Measures, these policies cannot be considered to have any effect. The RDEIR’s conclusion that the impact would be **Less than Significant** or that **no mitigation** is required beyond that cited in the policies of the proposed GPU.

I19-82

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

- Table ES-4 indicates that the likelihood of **Impact 3.9-1 (The proposed project would require new or expanded water supplies, facilities and entitlements)** is **Significant and Unavoidable**, and that “**no additional technologically or economically feasible mitigation measures are currently available to reduce this impact to less than significant level.**”

I19-83

Inconsistently, the RDEIR concludes its discussion of **Impact 3.9-1** by noting that “even with implementation of the below mentioned policies, this impact is considered potentially significant.” At page 3.9-49. Among the “below mentioned policies” in the discussion section is FGMP Policy 9.2, which requires the County to “require evidence, prior to project approval, which (1) describes a safe and reliable method of wastewater treatment and disposal; and (2) substantiates an adequate water supply for domestic and fire protection purposes.” Unfortunately, this policy **has no Implementation Measure**, meaning it cannot be implemented or enforced, and cannot have been reasonably relied on in determining either the overall impact of the proposed project or that there are no feasible mitigation measures.

One obvious mitigation measure available to the County is the adoption of a reasonable, smart or healthy growth alternative to the proposed “market driven” plan that actually requires enforceable policies and implementation measures designed to reduce water consumption, promotes recycling and use of grey water for irrigation purposes, and incorporates at the least LEED-ND standards for new development or improvements, with specific, quantifiable and measurable implementation measures. And then to actually enforce the policies.

- The RDEIR cites FGMP Policies 11.2 and 11.3 in support of its conclusion that the likelihood that **The proposed project would increase the need or use of fire protection services in the County (Impact 3.9-5)** is “less than significant.” These same two policies – 11.2 and 11.3 are also cited in connection with **Impact 3.9-6 (The proposed project would increase the need or use of law enforcement services in the County.)**, which is also considered “less than significant.” **There is no Policy 11.2 or Policy 11.3 (or any Policy 11 at all) in the revised FGMP.** (FGMP Policies 10.2 and 10.3 do deal with fire protection and law enforcement, but **neither of these policies have an Implementation Measure** and as such they are of no effect.

I19-84

I19-85

- **Impact 3.10-1 The proposed project would result in the substantial conversion of important farmlands to non-agricultural uses. Significant and Unavoidable.**

I19-86

The County maintains that preservation of agricultural resources is a key goal of

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

the draft General Plan 2030 Update, that the policies of the draft GPU call for the continued recognition of agriculture as the primary land use in the Valley and Foothill regions of the County, and cites among those policies FGMP1.10 and 5.1. But as revised, the protections for agricultural uses in the current Foothill Growth Management Plan have been decimated. Important existing policies have been completely eliminated, without either explanation or disclosure. (See comments to revised Goal 5 in chart below.)

I19-86  
cont'd

FGMP Policy 1.10 limits residential densities only within the development corridor areas of Success Valley, and then, only in order to avoid conflicts with intensive agricultural uses in the *Valley – it does nothing to protect agriculture in the Foothill region*.

I19-87

FGMP 5.1 merely duplicates the language of Goal 5, and then weakens its impact by the discretionary “wherever possible”. More tellingly, the supposed Implementation Measures for Policy 5.1 have also been weakened: IM-17 and IM-18 are loosely based on current policy 5-1 and 5-2, which protect extensive and intensive agricultural areas in the foothills from encroachment by non-agricultural uses through the use of large lot exclusive agricultural zoning. Under the current FGMP, these policies are specifically implemented via the Level I and Level III analyses required as part of the plan. (The implementation measure for current policy 5-1 further notes that agricultural lands within a development corridor may be *required* to remain as extensive agriculture if site plan review determines the water supply to be inadequate to support urban use or if the soil is inappropriate for adequate waste water disposal.) As reformatted, the Implementation Measures no longer provide clear statements directing that ag lands in the foothills be protected. See more detailed comments in chart below.

I19-88

Given the weakening of these FGMP policies, it is no wonder the EIR considers the impact to important farmland within the FGMP area to be “**significant and unavoidable**”!

I19-89

The cited policies of the Agriculture Element of the Goals & Policies Report are also weak: AG-1.6 and AG-1.18 are discretionary (“The County *may* develop an Agricultural Conservation Easement Program....” and “in-lieu fees collected by the County *may* be transferred to the Central Valley Farmland Trust...”). Anything that “may” be done, also “may not” be done; this policy is altogether too equivocal. More to the point, the Central Valley Farmland Trust covers lands only in the northern counties of San Joaquin, Stanislaus, Sacramento and Merced – not Tulare County. **Does the County intend to mitigate loss of County ag land through easements obtained on lands outside the County??**

I19-90

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

- **Impact 3.10-2 The proposed project could conflict with the provisions of the Williamson Act contracts through early termination of active Williamson Act Contracts.**

I19-91

The RDEIR rates this potential Impact as “**less than significant**” and as requiring no **mitigation measures beyond what is proposed in the policies of the proposed GPU**. However, FGMP Policy 10.1, Implementation Measure 16, specifically instructs the County to “explore the options for voluntary **Williamson Contract cancellation** on lands that are within a development corridor and under a Planned Development-Foothill Zone.” **This evaluation is completely inconsistent with the County’s mantra of protecting agricultural lands in the County in general, with its Right to Farm policy, and with Goal 5 of the FGMP, which specifically directs the County to protect ag lands in the Foothills.**

Among the mitigation policies cited in the RDEIR for this Impact is AG In addition, the proposed GPU’s creation of new “Planned Community Areas” which may be permitted anywhere in the County as long as the property has a minimum of 200 acres actively **encourages conversion** of lands likely to be in the Williamson Act. (See, e.g., comment above noting discussions between RMA and owners of agricultural land adjacent to the proposed Yokohl Ranch development.)

In assessing whether implementation of the draft GPU

- **would have a substantial adverse effect, either directly or through habitat modification, on a variety of special status species (Impact 3.11-1), or**
- **on riparian habitats or other sensitive natural communities, (Impact 3.11-2), and**
- **on “federally protected” wetlands and other waters (Impact 3.11-3)**

I19-92

the RDEIR notes that the FGMP contains a number of policies developed to address sensitive habitats and species specific to the unique Foothill area. While the policies cited – FGMP Policies 5.1, 8.1, 8.5, 8.12, 8.13, 8.14 and 8.19 – are steps in the right direction, they are inadequate to accomplish their intended purposes as mitigation measures as the result of limitations on scope or strength inherent in the language of the individual policies, and of ineffective or entirely absent Implementation Measures.

For example, the policy expressed in 8.1 is merely to “discourage” rather than to prohibit development in close proximity to watercourses and riparian areas; 8.12 prohibits “unnecessary” removal of trees *only* prior to approval of development plans; 8.13 requires developers to use landscape materials that are “compatible” with native vegetation, but not native vegetation that would sustain wildlife adapted to and dependent on the native vegetation itself; 8.14 applies only where special status species “have been identified” – and it has no Implementation Measure to ensure that the policy is actually carried out. (The California Endangered Species

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

Act also protects threatened and candidate-species to the same extent as those named as rare or endangered.) And Policy 8.19 again only “encourages” protection of unique open spaces. Policy 5.1 is discussed above – while it purports to protect agricultural uses, it says nothing about protecting special status species or habitats. While protected species may benefit indirectly from protection of agricultural lands, they are also stripped of the protection otherwise provided under the Federal Endangered Species Act as a result of the exclusion for accidental “takings” of protected species that may occur in connection with normal agricultural practices. Policy 5.1 cannot therefore really be considered a policy developed to address protection of sensitive habitats, species, and natural communities.

I19-92  
cont'd  
I19-93

In addition, Policies 5.1, 8.1, 8.12 and 8.19 all depend on Implementation Measure 7, which does no more than require site plan review “for projects that only require Site Plan Review”. There is no explanation of which types of projects “only require Site Plan Review” and which may require more... or what more. Policy 8.1 is apparently also supposed to be implemented by having environmentally sensitive areas (if they are within development corridors) identified on a map – but there is no further requirement that development be prohibited in such identified areas, and no protection is afforded sensitive areas outside development corridors. Policy 8.13 depends for implementation on a measure that simply repeats that site plan review should assess the compatibility of selected landscape materials with “surrounding” native vegetation. And 8.14 has no Implementation Measure at all.

I19-94

These policies **can’t mitigate** the potential for substantial adverse impact on habitat or species, but the impact could be less than substantial with properly drawn, strong, and implementable and enforceable policies.

I19-95

The two ERM policies cited in Table ES-4 also do little to avoid substantial adverse direct or indirect effects on wildlife through habitation modification. ERM-1.15 has the County ensuring that street lighting in new development doesn’t illuminate adjacent natural areas more than 1 footcandle above ambient levels; ERM-1.9 has the County working with other agencies to preserve biological resources while retaining the ability to utilize the same resources. Neither of the cited policies deals with the real and substantial impacts caused by disturbance or elimination of habitat, territory necessary to support wildlife species, etc. For example, several varieties of eagles and the endangered California Condor hunt and nest in the Yokohl Valley. Figure 3.11-1 in the RDEIR shows the entire Yokohl Valley area as designated critical habitat for the Condor. At page 3.11-14, the RDEIR acknowledges the findings of the US Fish and Wildlife Service: *The California condor requires substantial areas of open range, with adequate food, and limited development and disturbance to survive. Critical habitat for this species in Tulare County is generally located between Highway 65, Highway 198, and the western boundary of the Sequoia National Forest* (emphasis added). The designated critical habitat is precisely where the County is proceeding with plans to develop a massive Planned Community Area, and has proposed additional development on adjoining properties.

I19-96

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

Conversion of this currently – agricultural area to urban uses will significantly affect the ability of these species to survive. (Not to mention the problems caused when one of these predatory birds carries off Fluffy ....) ERM 1.16 and ERM 1.17 both require only that the County cooperate or coordinate with other agencies which may be taking actual, proactive and positive steps to protect and preserve habitat and species.

I19-96  
cont'd

The charts of Mitigating Policies on RDEIR pages 3.11-34 and 3.11-37 identify FGMP Policies 4.1 and 8.9 in connection with **Impact 3.11-1** in addition to the policies identified in the text of the section. FGMP Policy 4.1, requires the County to identify environmentally sensitive areas, but only within development corridors. Since the County may permit Planned Community Areas anywhere within the Foothill area, this Policy does not adequately protect sensitive habitat or species at risk of development but currently not designated as a development corridor. More importantly, Policy 4.1 **has no Implementation Measure** and thus cannot be enforced. Policy 8.9 restricts the removal of native vegetation. However, it also **has no Implementation Measure** and is without effect.

I19-97

[NOTE – the RDEIR cites IMs 15, 23 and 26 in connection with these policies, but they do not so appear in the FGMP as included in the Goals and Policies Report. In any event, IM 23 applies only to designate areas within development corridors on reference maps. Implementation Measure 26 focuses on site plan review of landscape plans to ensure compatibility with surrounding vegetation.]

- Identified **Impacts 3.11-4 (The proposed project would have a substantial adverse effect on wildlife movement opportunities, migratory corridors, or native wildlife nursery sites )**;
- **3.11-5 (The proposed project could conflict with local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance. ) and**
- **3.11-6 (The proposed project could conflict with the provisions of an adopted habitat conservation plan, natural community conservation plan, or other approved local regional or state habitat conservation plan.)**

I19-98

all also cite either the ERM policies directed to lighting and coordination with other agencies, or assert that no additional mitigation measures are needed (Impact 3.11-5). The impact of 3.11-4 is considered **Significant and Unavoidable** ; the impacts of 3.11-5 and -6 are deemed **“Less than Significant”**.

**FGMP Policies 4.1, 8.1, 8.5, 8.12, 8.14, 8.19 and Implementation Measure 23** are identified as policies mitigating the expected impact of adopting the proposed GPU. For all the reasons set out above, these policies do not mitigate the “significant and unavoidable” adverse effects of implementing the GPU 2030 as drafted on wildlife, and cannot contribute to the EIR’s conclusion that there will be a “less than significant” impact on or conflict with local policies protecting biological resources. Stronger and

I19-99

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

more focused policies and Implementation Measures could reduce the anticipated impacts. More to the point, a General Plan that adopted a truly city and existing-community-focused, smart growth alternative which prohibited the creation of entirely new towns and expanded development corridors, and which permitted Planned Community Areas only within UABs if at all, would go a long way to realizing a “less than significant” impact on wildlife and other biological resources.

I19-99  
cont'd

- In connection with **Impact 3.12-1 (The proposed project could cause a substantial adverse change to a historical resource)**, the EIR cites FGMP Policies 7.1 and 7.3 as having been designed to address the important cultural resource issues of the FGMP area. Policy 7.1 (“The County may require the developer to provide information at time of application submittal regarding any historical site and/or building that occupies the project area that is worthy of historical preservation.”) is purely discretionary by virtue of the permissive word “may”. The Implementation Measure (IM-22) for this policy also inappropriately places the determination of whether a historical site or building is “worthy of historical preservation” on the developer, whose interests will by definition be in conflict with a finding of historical worthiness. The policy, as written, will not advance the goal of protecting historical or archeological sites. While IM -22 is good start for protection of archeological sites, insofar as it defers evaluation of the site to a professional organization with appropriate expertise, FGMP-7.1 deals with all historic sites, not just archaeological sites. IM 22 therefore doesn’t further the policy for other historic sites. In addition, IM.22 only applies to areas “located in proximity to hilltops, buttes, watercourses, etc.” To be truly effective in protecting historic and archeological sites this limitation should be eliminated so that a proper evaluation is made no matter where the site is located.

I19-100

FGMP 7.3 (“The County shall protect significant historical or archeological sites, such as the one located on Rocky Hill, from development through maintenance of the site in open space. This policy shall not preclude development on adjacent property even though such property may be under the same ownership as the site to be protected.”) does require protection of significant historical or archeological sites, but it too is ineffective because it **has no Implementation Measure**.

I19-101

The EIR also cites FGMP Policies 7.2 and 7.3 in connection with **Impact 3.12-2 (The proposed project could cause a substantial adverse change to archaeological resources, paleontological resources, and/or disturb human remains)** as “calling for protection” of important sites. But again, 7.3 has no Implementation Measure so it can’t protect any identified important sites. Policy 7.2 (“The County may require the developer to provide information at time of application submittal regarding possible archeological sites if a project is located in proximity to archeological sensitive areas such as hilltops, buttes,

I19-102

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

<p>watercourses, etc.”) is also purely discretionary – and ill advised. <b>What expertise does the average developer have that would permit it to accurately identify possible archeological sites? And why should such sites be limited to hilltops, buttes, etc.? Does the RDEIR factor in the likelihood of damage to or elimination of important archaeological or other historic sites resulting from this ill-advised delegation of this function to developers in its assessment of environmental impact significance?</b></p>	<p>I19-102 cont'd</p>
<p></p>	<p>I19-103</p>

<p>Finally, the Impact Analysis for <b>Impact 3.12-2</b> states that “Policies within the FGMP ... establish protocols to address archeological resources” and “include a number of policies . . . designed to address the important cultural resource issues of the FGMP area including development of a historical sites inventory, information on archeologically sensitive areas and the protection of significant cultural resource sites (i.e., Rocky Hill). . . . The only policies cited – 7.2 and 7.3 do not establish any protocols, do not require development of an inventory, and as noted, do not truly protect historical sites. (Query: is Rocky Hill the only site deemed worthy of protection? Only Rocky Hill appears as an example of a historical site. In the FGMP area, the 100-year old Kaweah Post Office – surely a historical site, since it is listed and marked with a State Historical Marker – is absent from the list of Known Historical Properties on page 3.12-17....)</p>	<p>I19-104</p>
---	----------------

## Hydrology, Water Quality and Drainage

<p>WR-1.1 and WR-1.3 are addressed on page 3.6-45 of the RDEIR. Policy WR-1.1 is found on Part I, page 11.6 of the GPU – that policy says “These actions shall be intended to help the County <b>migrate</b> the potential impact on ground water resources identified during planning and approval processes.” We believe the word “migrate” should be “mitigate.” Please correct.</p>	<p>I19-105</p>
---	----------------

<p>WR-1.3, page 11.7 of the GPU, requires the County to “regulate the permanent export of groundwater and surface water resources allocated to users within the County to cities and service providers outside the County to the extent necessary to protect the public health, safety and welfare. The County shall strive for a “no net loss” where there may be water exchanges serving a public purpose.”</p>	<p>I19-106</p>
---	----------------

Given the vital role water plays in sustaining the extensive agricultural economy of the County, the dependence of most non-city dwellers on ground water and wells, and the documented drastic overdraft situation of water supplies in Tulare County, permanent export of water to users outside of Tulare County should be prohibited outright. Water is not really a renewable resource – while the supply can be recharged over time if we continue to experience the levels of rain and snowpack considered “normal” in non-drought years, given the facts that California has recently experienced many years of drought conditions and water shortages, and given the climate change and global warming predictions, it is short-sighted to permit any permanent claim on a resource the County and its residents may well need in the future.

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

Since the RDEIR also has concluded that “Due to the uncertainty of future groundwater management efforts ... insufficient future groundwater supplies may be experienced in portions of the County” and that the environmental impact that adoption of the GPU will have on water supplies is Significant and Unavoidable, this policy should be revised to prohibit the permanent transfer of water rights outside the County.

I19-106  
cont'd

WR-1.4, provides that:

I19-107

“For new urban development, the County shall discourage the transfer of water used for agricultural purposes (within the prior ten years) for domestic consumption including but not limited to the following:

- The water remaining for the agricultural operation is sufficient to maintain the land as an economically viable agricultural use,
- The reduction in infiltration from agricultural activities as a source of groundwater recharge will not significantly impact the groundwater basin *[New Policy]*.

There appears to have been a transcription error in setting out this policy, as the bullet points don't relate to the preceding paragraph. Please correct so the policy can be appropriately evaluated.

## Biological Resources

I19-108

Pages 3.11-11 through 3.11-15 list Sensitive Natural Communities. The Kaweah Brodiaea, *brodiaea insignis* has been listed as “endangered” by the State of California since 1979, and as a Species of Concern by the U.S. Fish and Wildlife Service. It is native to the Sierra foothills- **Why is the endangered Kaweah Brodiaea not listed?**

## Cultural Resources

I19-109

Figure 3.12-1 (RDEIR page 3.12-7) contains a photograph of the historic Kaweah Post Office, which was built in 1886, and has been serving the Kaweah and Three Rivers communities for 100 years. The Post Office has been identified as a structure of statewide historic significance and received California State Historical Marker # 389, yet this building is not listed in any of the lists of historic properties in the RDEIR. Please add the Post Office to the list of buildings to be protected and preserved as historic.

## Alternatives

I19-110

The RDEIR lists **28** significant and unavoidable impacts that will result from adopting and implementing the revised GPU. Such extensive negative impacts clearly should be considered unacceptable in a plan that cites as its first value statement, “The beauty of the County and the health and safety of its residents will be protected and enhanced.”

How the County should respond to those 28 significant and unavoidable impacts is

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

clearly set out in the CEQA statute: “public agencies should not approve projects as proposed if there are feasible alternatives or feasible mitigation measures available which would substantially lessen the significant environmental effects of such projects.” CEQA §21002. Each public agency shall mitigate or avoid the significant effects on the environment of projects that it carries out or approves whenever it is feasible to do so. CEQA §21002.1 (b).

I19-110

Here, the County has identified four alternatives (in addition to the “No Project alternative) the RDEIR describes as a reasonable range of alternatives having been selected based on their potential ability to meet project objectives while also avoiding or lessening the significant environmental impacts identified as likely to result from adoption of the proposed GPU. Unfortunately, we must disagree with the RDEIR’s conclusion that it has presented a reasonable range of feasible alternatives. The County improperly incorporated all of the proposed GPU’s policies and implementation measures into each alternative<sup>12</sup> rather than preparing sets of policies and implementation measures specific to each alternative.<sup>13</sup> As a result, the environmental impacts of each alternative have been predetermined, and the analysis skewed. You can’t get to Boston using a map to Miami; you can’t get to compact, smart growth using policies and implementation measures that take you to Regional Growth Corridors and new towns.

I19-111

When examined, the RDEIR itself discloses that the range of alternatives is actually very narrow. Table 4-1, for example, which outlines how the assumed population growth would be allocated under each of the alternatives shows only a difference of about 6% between them: growth in the incorporated cities ranges from 68% (Rural Communities & Transportation Corridors) to 74% (No Project and Confined Growth). The range for population growth allocated to the unincorporated County ranges from 26% (No Project and Confined Growth) to 32%. (Rural Communities and Transportation Corridors). RDEIR at 4-4 -- 4-5.

I19-112

Analysis and comparison of the various alternatives is also problematic and confusing. For instance:

I19-113

- Table 4-1 is identified as a “Summary of Key Components for Each Alternative.” Yet the only data included in the table is a population distribution projection based on a 2007 baseline year. Because the table does not include any other “key components” of the various alternatives, it does not facilitate comparison of the alternatives. To be useful, the table should mirror the discussion points addressed in the text of each alternative.

12 The “No Project” alternative is also the only alternative in which the RDEIR does not assume that all the policies and implementation measures of the proposed GPU are also adopted by the alternative. It is therefore impossible to accurately assess the No Project alternative relative to the others.

13 As noted elsewhere in these comments, CEQA requires the range of alternatives to have their own sets of policies and implementation measures. Incorporating the proposed project’s policies and implementation measures into each alternative not only skews the results, but predetermines the outcome of the analysis.

I19-111  
cont'd

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

- On page 4-4 the RDEIR states that that the “No Project” alternative assumes that development will continue under current patterns, but then also assumes that population patterns would be similar to those under the proposed GPU. **How does the proposed GPU differ, then, from the No Project alternative in its environmental impacts? Will it have no influence or effect? If so, how do each of them differ from the Existing Trends alternative that was rejected?**

| I19-114
- The RDEIR’s reasoning in the “Ability to Meet Project Objectives” text on page 4-13 is completely circular: failure to adopt a plan (the result in the No Project alternative) fails to meet the project objectives because it fails to adopt a plan – one of the project’s objectives.

| I19-115
- Table 4-2 compares the ability of each alternative to meet the project’s proposed objectives. The “No Project” alternative is identified as achieving none of them. **Does this mean that the current General Plan provides no opportunities for small unincorporated communities to grow and improve their quality of life and economic viability? Does not promote reinvestment in existing communities? Or protect the County’s agricultural and scenic assets by limiting rural residential development?** It seems that despite the acknowledgment to the contrary on page 4-13, the RDEIR has assumed that the “No Project” alternative leaves a complete vacuum as to planning guidance rather than resulting in continuation of the current General Plan.

| I19-116
- In discussing the alternatives eliminated from consideration, the RDEIR lists a Proportional Growth alternative, which is described as directing growth at a rate proportional to current conditions, and an Existing Trends alternative which would allow future growth to grow at the rate that occurred from 1990 to 2000. **How do these two alternatives differ?** The RDEIR explains that the Proportional Growth option was rejected because the growth trend (30% of future growth in the unincorporated County) was considered infeasible. Yet the Transportation Corridors alternative (which seems to be the same as the Corridor Plan concept incorporated into the draft GPU) also allocates 30% of future growth to the unincorporated County. **How does the Corridor Plan concept in the GPU differ in projected growth trend, and in general, from the Transportation Corridors alternative?**

| I19-117
- On page 4-1, the RDEIR cites to CEQA Guidelines §15901 – this section does not exist. We believe the RDEIR intended to reference §15091; please correct if this is what was intended. If the RDERI intended to reference another section, please so indicate so the authority may be identified and assessed.

| I19-118
- Table 4-3 provides a Summary of Alternatives (Comparison of Impacts With General Plan 2030 Update Level of Significance), but although it provides the County’s conclusions as to the significance of the various effects it does not provide sufficient detail in the discussion of the various alternatives to assess

| I19-119

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

how those conclusions were reached<sup>14</sup>. For instance, the RDEIR concludes – without substantiation -- that both the City Centered and the Confined Growth alternatives would have greater adverse impacts than the proposed GPU on cultural resources (historic & archaeological). RDEIR at page 4-8. The basis for these conclusions is that new growth, centered within existing City areas, “could result in similar or greater impacts to historic resources located within existing urbanized areas. The intensification of land uses within the existing City limits may result in greater impacts to the design qualities of individual City neighborhoods and historic districts to those anticipated under the proposed project” (RDEIR at 4-20 - 4-22 and 4- 43). There is no evidence or even discussion in the RDEIR to establish that urban infill or growth within city limits is any more likely to impact historic or archaeological resources than development in the unincorporated areas of the County.

I19-119  
cont'd

Although not truly “smart growth” plans, two of the four proposed alternatives do lessen the anticipated environmental impacts of attaining the GPU’s identified objectives and therefore are superior to the proposed GPU.

I19-120

The City Centered alternative is one of the alternatives that would yield an environmentally superior result, as it lessens 14 of the environmental impacts identified as Significant and Unavoidable (“SU”) in connection with the proposed project. But the RDEIR concludes that it fails to meet the project’s objectives of providing opportunities for small communities and to promote reinvestment in Table 4-3. However, in setting out the alternative itself, on page 4-17, the RDEIR says “This approach *would not ignore the needs of unincorporated communities* [emphasis provided], and would look at policy solutions to address housing services and infrastructure needs to meet future growth.” On page 4-18, the RDEIR notes that this alternative would achieve the objectives by integrating additional policies into the General Plan, including a policy that the “County continues to improve quality of life and services in unincorporated communities but does not make growth inducing infrastructure improvements.” It *is* possible to improve quality of life and improve infrastructure without also inducing growth.

**How then does the RDEIR conclude that City Centered alternative does not meet the identified objectives – unless the County ensures its failure by taking no actions to improve services that do not also induce growth?** (The RDEIR

---

14 While CEQA does permit use of a matrix to summarize the results of a comparison between alternatives and the proposed project, the EIR must first include sufficient information about each alternative to allow meaningful evaluation, analysis, and comparison with the proposed project. CEQA §15126.6(d). Similarly, the EIR must examine in detail those alternatives the lead agency has determined could feasibly attain most of the basic objectives of the project. The range of feasible alternatives shall be selected and discussed in a manner to foster meaningful public participation and informed decision making. Id. §6(f). Meaningful participation cannot take place where only the agency’s conclusions are shared.

I19-119  
cont'd

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

apparently bases its conclusion on its speculation at page 4-19 that “Lower levels of anticipated growth and development *may* make it more difficult to achieve the desired level of reinvestment within existing communities and hamlets. Consequently, Alternative 2 would not meet this objective and *may* not fully meet project objectives that encourage additional opportunities for small unincorporated communities to grow, address public health and safety concerns, and improve quality of life.” (emphasis added). Inherent in any prediction that X *may* result in Y is the possibility that X will *not* cause Y. Since without more, the probability of each is equal to that of the other, the RDEIR’s conclusion that this alternative is *not* able to meet the reinvestment and quality of life objectives is unsupported.)

I19-120  
cont'd

With respect to Air Quality impacts, the RDEIR concludes that environmental impact of both the City Centered and Confined Growth alternatives is equal to that of the proposed GPU (SU), see Table 4-3, page 4-7, because even though the overall number of miles driven may be reduced, “city focused dwelling units and other types of development would still result in similar overall emission levels of both mobile and stationary sources.” **What percentage of GHGs and other emissions in the County result from vehicles and what percentage from stationary sources? On what basis has the County concluded that emissions from stationary sources outweigh vehicle emissions?**

I19-121

In virtually every aspect, the RDEIR finds the Confined Growth alternative the only alternative other than the No Project alternative “that would reduce the severity of most environmental impacts associated with the proposed project.” RDEIR at 4-36. It is also identified as the Environmentally Superior alternative. Nevertheless, the RDEIR concludes that the Confined Growth alternative “would still result in significant and unavoidable impacts to biological, agricultural, air quality, greenhouse gas emissions, and traffic resources.” *Id.*

I19-122

How does it get to this conclusion?

Agriculture – after recognizing that fewer acres would be converted to urban uses, the RDEIR simply says “similar to the proposed project, Alternative 5 would also result in a significant and unavoidable impact, since there would be some conversion of important farmland to urbanized uses under this alternative.” **How many acres? Where? Within already-designated urban boundaries? What threshold of significance is applied?**

I19-123

Air Quality – see above.

I19-124

GHGs – after recognizing that confined growth “may reduce the overall number of vehicle miles driven” the RDEIR concludes that “City focused dwelling units and other types of development would result in similar energy consumption and greenhouse gas emission levels for buildings and mobile and stationary sources.” **No documentation, no discussion. Inadequate!**

I19-125

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

Traffic – Without discussion, the RDEIR just concludes “Overall total daily vehicle trips generated under this alternative would be similar to those anticipated with the proposed project.” And then also notes that service levels on roads within urban levels could be reduced. **Where is the calculation of trips not taken – and emissions not emitted -- by individual vehicles because of the availability of convenient public transportation ? The calculation of fewer emissions as a result of fewer vehicle miles traveled, as compared to simply the number of daily trips?**

I19-126

The RDEIR comes to similar unsubstantiated and disconnected conclusions in other areas of “discussion” as well: light and glare impacts would be lessened but the resultant impact would be similar to that of the proposed project (page 4-33); fewer acres of open space lands would be converted but the impacts to biological resources would be similar to those under the proposed project (page 4-34); fewer impervious surfaces would be developed... but overall, hydrologic and water quality impacts are considered to be similar to those of the proposed project (page 4-35).

NOTE: While presented as a “confined” growth alternative, as framed in the RDEIR, the exceptions make those borders very porous. Thus, growth boundaries could be expanded for a number of reasons which appear to reflect the ongoing effort to avoid restricting the County’s ability to follow the market.

I19-127

“Criteria for expansion might be:

- Mandatory agriculture impact fees for important farmlands added to Urban Development Boundaries [**This is not a criteria - what does it mean? That if someone pays a fee, important farmland will be permitted to be converted?**]
- Significant job generation projects or projects of regional importance (such as a four year college)
- Regional growth corridors which involve high density mixed use as well as commercial or industrial opportunities.
- Boundary adjustments where Master Planning efforts demonstrate exemplary land use efficiency standards above and beyond base standards.
- Boundary expansion in consistent with the San Joaquin Valley Regional Blueprint.

... No new towns would be allowed on important farmland unless equivalent capacity is transferred from CACUDBs or HDBs through mechanisms such as purchase and transfer of development rights to offset the loss of important farmland.” RDEIR at 4-32.

The re-insertion of these “criteria” – especially the provision that would reinstate the regional growth corridors, Planned Community Areas (“Master Planning efforts”) – is entirely inconsistent with the overall concept of “confined” growth. **Only with these exceptions in mind could the RDEIR conclude that the impacts of this alternative on biological, agricultural, air quality, greenhouse gas emissions, and traffic resources are significant and unavoidable.**

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

The bottom line is that we agree with the California Attorney General's criticism of the 2008 DEIR, which also applies here: "The alternatives ignore a range of "smart growth" alternatives that would concentrate development in already existing urban areas near mass transit and preserve more agricultural land and open space," and noted that "a more intense 'smart growth' alternative would appear to be feasible given the evidence that existing cities can currently accommodate all of the growth anticipated by the County. . . to be consistent with CEQA, the DEIR must consider a broader range of alternatives that would focus more of the development in existing urban areas, or explain and provide evidence supporting a conclusion as to why such alternatives would be infeasible." (Letter from Office of the Attorney General, dated April 14, 2008, copy attached.) **The County should consider and adopt a true smart and healthy growth alternative such as the one suggested by the Tulare County Citizens for Responsible Growth in 2008.**

I19-128

\*\*\*\*

While CEQA stresses the importance of seriously evaluating a range of alternatives, the County appears to have signaled its intention to disregard potentially superior alternatives to its preferred project, by stressing the importance of the "escape clause" it sees, before even having presented the proposed alternatives:

I19-129

It is important to understand, however, that the mere inclusion of an alternative in an EIR does not constitute definitive evidence that the alternative is in fact "feasible." The ultimate decision regarding the feasibility of alternatives lies with the ultimate decision-maker for a project, which in this case is the County of Tulare Board of Supervisors. Such determinations are to be made in statutorily mandated findings addressing potentially feasible means of reducing the severity of significant environmental effects. One finding that is permissible, if supported by substantial evidence, is that "specific economic, legal, social, technological, or other considerations . . . make infeasible the . . . alternatives identified" in the EIR (Pub. Resources Code, § 21081, subd. [a]; see also CEQA Guidelines, § 15901, subd. [a]). CEQA Guidelines section 15364 defines feasible" to mean "capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors." In deciding whether an alternative is feasible or infeasible, a decision-making body may consider the stated project objectives in an EIR, and may balance any relevant economic, environmental, social, and technological factors.

RDEIR at page 4-1.

But the purpose of CEQA is not to generate paper, but to compel government at all levels to make decisions with environmental consequences in mind. (*Bozung v. LAFCO* (1975) 13 Cal.3d 263). **In making its recommendation on a final EIR, we urge the County to heed CEQA's requirement that it focus on alternatives which are**

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

**capable of avoiding or substantially lessening any significant effects for the project, even if these alternatives would impeded to some degree the attainment of the project objectives, or would be more costly. See CEQA §15126.6(c).**

I19-129

### The Revised Foothill Growth Management Plan

#### I. Undisclosed Revisions, Deletions, Other Changes

I19-130

As noted earlier in these comments, and as examined in more detail below, although the County has told the public many times that the Foothill Growth Management Plan was not being changed in connection with the GPU process, it has been changed significantly in a number of ways. For instance, on page 1-1, the "Background" section states that "...the Community and other Plans... will not be changed as part of this update, except for Dinuba... and Pixley." RDEIR 1-1. But on page 2-13, the RDEIR discloses that both the RVLP and FGMP "will be adopted in revised form." Although the RDEIR describes the changes in this introductory statement as merely deleting obsolete or outdated information and policies, providing "clarification" to policies and consistency with the new Land Use Element, as well as identifying responsible agencies, implementation timeframes, and restoring FGMP development standards, RDEIR at 2-13, examination of the FGMP, for instance, reveals significant substantive changes.

In addition to not calling the public's attention to the fact that the FGMP has been changed<sup>15</sup>, the RDEIR does not compare the provisions of the two plans to make clear what has been changed and in what ways, doesn't provide any – let alone a sufficient – rationale for the changes, doesn't establish or analyze baseline conditions upon which it could evaluate the potential impact of the proposed changes, and doesn't assess the potential direct or indirect negative impacts of the changes, either on an individual or cumulative basis. All of the policies and IM s are shown in the implementation timeline as "ongoing" with no anticipated completion date. But virtually all have been in the FGMP since 1981 – what progress has been made? Where is the supporting data? Baselines against which to measure future progress?

- The Introduction to the Policies section of the 1981 Plan establishes that

I19-131

[t]he overall objective of the study is to accommodate development within the foothills while recognizing limitations imposed by factors such as excessive slope, present development patterns, increased wildfire

<sup>15</sup> In fact, the County has many times represented that the FGMP has not been changed, but is being incorporated into the GPU.

I19-130  
cont'd

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

potential, service availability, water availability, soil limitations for septic tanks, site accessibility, etc.... Further, the policies reflect the fact that even though land may be physically capable of being developed, other overriding factors such as the preservation and protection of foothill-grazing lands may limit such activity.

I19-131  
cont'd

1981 Plan at 11.

These statements, which set out the fundamental underpinnings of the Foothill Growth Management Plan, and explicitly recognize the limitations that must inform all development decisions in the Foothills, have been deleted from the Revised FGMP.

Please explain why the Revised FGMP has completely eliminated this crucial statement of fundamental principals underlying the Foothill Growth Management Plan, and assess 1) what the direct, indirect, and cumulative impacts of deleting this statement of principals will be; 2) how those impacts have been or will be measured; and 3) how the County will mitigate the impacts resulting from the elimination.

Answers to these questions are critical in light of the County's demonstrated willingness (and in some instances, apparently eagerness) to green-light development within the FGMP that disregards (and even requests exemption from) the policies and standards of the FGMP.

Moreover, the RDEIR does not disclose that the Revised FGMP fails to include, even by reference, the substantial additional data resulting from the federally-funded, in-depth study of the Foothill area, which are contained in the Appendices to the 1981 Plan:

I19-132

- a description of the Foothill region; socioeconomic, housing and land use data; a detailed baseline description of environmental factors, including climate, air quality, watershed data, geological and soils information (including an in-depth soil matrix), and biological factors (including vegetation and wildlife data.)
- a study of Foothill Circulation Systems, including specific data on traffic volume by road and area, and expected impacts of anticipated growth
- an examination of existing public service systems and utilities in the Foothills fire protection (including identification of County and State fire stations and the service areas they cover); law enforcement (identifying the exiting Sheriff's office locations and service areas); school districts; health care providers; solid waste disposal services; public utilities; water and liquid waste systems; and public libraries serving the area
- legal authority for Specific Plans
- an explanation of the Site Plan review process applicable to the Foothills, including Foothill Extension and Development Corridors
- a detailed Environmental Impact Report (including comments)
- implementing Resolutions of the Tulare County Planning Commission and Board of Supervisors, including findings of fact and preliminary amendments to the 1981 Plan

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

- |  |                   |
|--|-------------------|
| <ul style="list-style-type: none"> <li>• definitions of terms used in the 1981 Plan, and</li> <li>• detailed maps, including maps of             <ul style="list-style-type: none"> <li>• the Foothill Growth Management Plan area that identify identifying lands designated as “valley agriculture extension”, “foothill extension”, “extensive agriculture” and scenic highways and roads);</li> <li>• Foothill Development Corridors, including designations of current and future land use and circulation patterns;</li> <li>• land capacity (identified by use-suitability);</li> <li>• slopes and flood-prone areas; and</li> <li>• vegetation (including identification of critical deer winter habitat)</li> </ul> </li> </ul> | I19-132<br>cont'd |
|--|-------------------|

<p>Nor does the Revised FGMP update this information by providing equivalent current data. While some limited amount of this data may have changed over time, most – especially all the data regarding the physical characteristics of the area, circulation systems, etc. – has not. The data and maps are therefore still pertinent and should be restored.<sup>16</sup></p>	I19-133
--	---------

<p>The Revised FGMP also has completely eliminated, without having disclosed these provisions as having been deleted, the following provisions in the 1981 Plan:</p>	I19-134
--	---------

- |  |  |
|--|--|
| <ul style="list-style-type: none"> <li>• The Site Plan Review process as it applies to the FGMP</li> <li>• All three of the agriculture policies that now require the County to protect foothill agriculture from encroachment of development, require zoning to protect viability of foothill agriculture, and limit residential development densities in Success Valley</li> <li>• Environmental Protection Goal 8, Flora &amp; Fauna, Policy 2, which provides “Prevent encroachment of development onto riparian woodland habitats.”</li> <li>• New Development policies 1 (Development proposals shall conform to all development standards) and 5 (To the greatest extent possible, new residential development should be compatible with existing residential development patterns).</li> <li>• The environmental impact report process that is now required in connection with evaluating the appropriateness of proposed developments</li> <li>• Various Implementation Measures associated with policies that still exist</li> </ul> |  |
|--|--|

<p>The RDEIR does not disclose the elimination of these provisions in the Revised FGMP, and has not, therefore, sufficiently or at all addressed any of the potential impacts elimination of these provisions may have.</p>	
---	--

<p>Perhaps more disturbing is that, since the County was in fact changing the FGMP, it did not take the opportunity to revise and strengthen the policies, to update them by integrating smart growth, conservation, and dark skies policies that would preserve and provide strong protections for the environmental factors that make the Foothills unique.</p>	I19-135
---	---------

<p><sup>16</sup> The 1981 FGMP has been amended since it was first adopted, yet those amendments have not been identified, so the public has no way of knowing what the actual status of the FGMP – which must function as the baseline since there is no other specified – is.</p>	I19-133 cont'd
---	-------------------

II. Ineffectual Policies; Vanished Implementation Measures

I19-136

Every policy must have at least one Implementation Measure. An implementation measure is an action, procedure, program, or technique that carries out general plan policy. State Guidelines, at 16.

- A full thirty three percent (33%) of the Revised FGMP policies have no Implementation Measures at all. Each of those policies is therefore deficient under both the State Guidelines and CEQA – it was impossible for the County to have evaluated the possibly direct, indirect or cumulative environmental impacts of a policy that has no force. Similarly, those policies in other sections of the GPU or the RDEIR which rely on the cited FGMP policies, or which cite them in mitigation of another assessed impact, are defective and must be fixed.
- In many other policies, the cited Implementation Measure does not in fact advance or implement the policy, or the language of the Implementation Measure is so limited in scope that it will do little to carry out the policy. Without enforceable implementation measures, the goals and policies of the Revised FGMP are merely wishful thinking, and cannot be relied on in any meaningful evaluation of potential direct, indirect, or cumulative impacts resulting from adoption or implementation of the GPU.

- Given the failure of the DEIR to base its analysis on specific policies and implementation measures that actually provide what the DEIR says they provide, the DEIR does not provide meaningful guidelines on which the public and decision-makers may rely. (And, although these comments focus on the FGMP section of the DEIR and GPU, it is reasonable to assume that the problems plaguing the FGMP portion of the DEIR are also present in other areas.) Accordingly, the DEIR does not meet the standards required by CEQA.

I19-137

As a result of these failures, and the deficiencies set out below, the RDEIR as relates both to the FGMP and the GPU in general is inadequate under CEQA and California state laws, and must be completely revised to provide the reliable analysis of the potential impacts that may be expected if the GPU is adopted and implemented. (Another cutting/pasting/rearranging will not do.) Even if County staff wanted to implement the faulty policies, they would be subject to challenge, as the County will have no legal foundation upon which to require adherence to what are in effect mere hopeful statements.

I19-138

In light of the significance of the changes made, and the inevitable impact eliminating currently-existing protections will have, such an analysis requires establishment and/or analysis of current baseline conditions, upon which it could reasonably evaluate the impact of the potential direct or indirect changes that could result from adoption and implementation of the GPU, on both an individual basis and as a whole.

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

The following chart sets out the revised policies of the FGMP, the Implementation Measures intended to actualize the policies, suggested modifications or revisions to the language of policies or Implementation Measures, and overall comments. Included in the Comments sections are issues raised under CEQA as well as questions regarding the FGMP itself, as revised, and requests for further revisions.

119-140

119-141

	POLICY	PROPOSED IMPLEMENTATION MEASURE	SUGGESTED MODIFICATION OR REVISION
<b>GOAL 1</b>	<b>To maintain the natural beauty of the foothills while allowing focused growth in identified growth areas. [New]</b>		
FGMP-1.1	<p>The County shall assure the existing values and identity of unincorporated areas in the foothills are properly addressed as development proceeds.</p> <p>[Current: Community Identity Goal 2: Assure that existing community values and identity are properly addressed as development proceeds in established areas.]</p>	IM-1. The County shall concentrate rural and urban development in the development corridors delineated on a Master Development Plan.	SEE PROPOSED MODIFICATION OF IM-5, BELOW AT 1.5, WHICH ALSO APPLIES HERE.
	<p><b>COMMENTS:</b> Policy 1.1 -- currently a goal under the 1981 FGMP -- only indirectly furthers the goal of maintaining the natural beauty of the foothills. <b>Please explain why this goal has been reduced to a policy under a goal that it does not directly relate to, and why the implementation measures that actually further this goal in the current plan have been eliminated or associated with some other goal.</b></p> <p>The goal/policy has been weakened by deletion of the important phrase "as development proceeds in <i>established areas</i>." <b>Please explain why the focus of this Policy has been changed from development in established areas to new development in planned communities (which won't have existing values and identity). Please also explain what "properly addressed" means.</b></p>

I19-142

	<p>The sole implementation measure for this policy, IM-1, is a re-working of the IM on page 35 of the current FGMP. The current IM "concentrates rural and urban development in the development corridors <b>only</b>."</p> <p><b>IM-1 does not implement the policy</b> because it fails to provide specific direction to consult with unincorporated communities to determine their values or "identity" as development decisions are made. Moreover, because IM-1 is linked to a Master Development Plan, which is referenced only in connection with Planned Communities, IM-1 applies only to new developments and specifically, to new planned communities.</p> <p>As revised, FGMP 1.1 and IM-1 deny existing communities the opportunity to accommodate some of the rural and urban development themselves. Public workshops and testimony strongly indicated that many existing communities need and want strengthening, some of which could come via limited development. Instead, IM-1 sets forth only the County's determination to focus growth in development corridors within new, planned communities. <b>Why has IM-1 been reduced in scope and weakened?</b></p>	<p><b>COMMENTS:</b> Under the California Endangered Species Act, threatened and candidate-species must be protected as well as those named as rare or endangered. Please revise FGMP 1-2 as shown above..</p> <p>All the IMs which are supposed to implement this policy address construction issues as regards safety issues, not protection of natural resources, which is the focus of the policy. They do not, therefore advance the policy.</p>
<p>FGMP-1.2</p>	<p>The County shall ensure that new development is designed in a manner that minimizes grading, vegetation disturbance, and intrusion onto natural watercourses, canyons and prominent landmarks, or rare and endangered species sites.</p> <p>[New Development: Goal 2 - same language]</p>	
	<p>IM-2. The County shall amend the Tulare County's Improvement Standards to reflect changes in foothill, street and grading standards.</p> <p>IM-3. The County shall require a grading and slope stabilization plan for that portion of the development exceeding slopes of greater than 15 percent.</p> <p>IM-4. The County shall require information in the site plan review process to delineate slopes 30 percent or greater on the development site. Review of the proposal by the Committee will prescribe a project design that will maintain 30 percent slopes generally free of improvements, unless the problems associated with steep slopes are sufficiently mitigated.</p>	<p><b>PROPOSED MODIFICATION:</b> IM-2. The County shall amend the Tulare County Improvement Standards to reflect changes in foothill, street and grading standards <b>that will regulate and minimize grading, and prohibits disturbance of native vegetation, and intrusion onto natural watercourses, canyons and prominent landmarks, or sites important to rare, endangered, threatened, or candidate species.</b></p> <p>Additional Implementation Measure(s) that specify how the policy will be realized are required to fully implement the policy. (Revision of IM-2 and specific Improvement Standards may be sufficient to meet this requirement.)</p>

119-142 cont'd

	<p>IM-2: good start, but the IM doesn't specifically require the County to change the standards in a way that will actually implement the policy. Please modify IM-2 as indicated above in bold. New standards should be specific and set out details to provide guidance to residents and to planners. (Please also fix the typo - delete "the" before "Tulare County's" or leave "the" and delete "s")</p> <p>As written, IM-2 is also vague - what are the Tulare County Improvement Standards? What changes have been or are being made in foothill street and grading standards? Or is this intended to apply to ensure that any future changes are incorporated into the TCIS by amendment? Please clarify.</p> <p>IM-3 deals only with slopes - how does this implement the policy elements related to vegetation disturbance, protection of watercourses, canyons, landmarks, and rare and endangered species?</p> <p>IM-4: again, good start, but addresses none of the policy elements other than to regulate improvements on slopes in excess of 30 percent. More disturbing: the entire section in the 1981 FGMP that set out the Site Plan Review process as it applies to the FGMP has been deleted; without this section, all the IMs that rely on actions of the Site Plan Review process or the Site Plan Committee are meaningless.</p>
--	---

119-143

FGMP-1.3	<p>When circumstances warrant, Community Plans, Master Development Plans, Specific Plans, Area Development Plans, and Hamlet Plans, shall be undertaken for identifiable community areas.</p> <p>[When circumstances warrant, specific plans, pursuant to the California Government Code, shall be undertaken for identifiable community areas.]</p>	<p>IM-5. The County shall appoint a committee of interested community residents when the Board of Supervisors determines a Community Plan, Master Development Plan, Specific Plan, Area Development Plan, or Hamlet Plan is necessary for an identifiable community area where the project boundary is coterminous with an existing HDB, UDB or PCA.</p>
	<p><b>COMMENTS:</b> IM-5 does not implement either the prior Goal from which this Policy was formed or the new Policy, as the IM appears to apply only when new development is taking place outside an existing Development Boundary or Planned Community Area, and when it will be "coterminous" - that is, when it will take place right on the community's boundary.</p> <p>The intent of the prior Goal (and of the current proposed policy) was and is to create specific plans for identifiable community areas in the foothills. Inherent in the Goal was the understanding that it applied to existing communities.</p> <p>What are the "circumstances [that] warrant" development of a Plan? To provide guidance to the public and to future members of the Board of Supervisors and Planning Commission, these circumstances should be identified.</p> <p>What is the "project" referred to in IM-5 as the trigger for involving community members in creating a Plan?</p>	

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

	Under what circumstances could a Planned Community exist and have "community residents" before a Master Development Plan had already been adopted?	
FGMP-1.4	<p>A citizen's advisory committee representative of residents of the affected area shall be utilized in any Community Plans, Master Development Plans, and Hamlet Plans undertaken which impacts an established community where the project boundary is coterminous with an existing HDB, UDB, or PCA.</p> <p>IM-5. The County shall appoint a committee of interested community residents when the Board of Supervisors determines a Community Plan, Master Development Plan, Specific Plan, Area Development Plan, or Hamlet Plan is necessary for an identifiable community area where the project boundary is coterminous with an existing HDB, UDB or PCA.</p> <p>PROPOSED MODIFICATION, POLICY 1.4: An advisory committee consisting of interested community residents shall be utilized in connection with the drafting, revising, or updating of any Community Plans Master Development Plans and Hamlet Plan.</p> <p>PROPOSED MODIFICATION, IM-5: To ensure that existing community values and identity are preserved consistent with Policy 1.1, the County shall work with a committee of interested community residents whenever the Board of Supervisors determines a Community Plan, Master Development Plan, Specific Plan, Area Development Plan, or Hamlet Plan is necessary for an identifiable community area.</p>	<p>Better: The County shall require new development to be designed in a manner that preserves the visual quality of the foothill setting through the use of curvilinear streets, vegetation reestablishment on cuts and fills, cluster development, and housing site locations that blend into the landscape rather than becoming a focal point.</p> <p>Better: IM-7. The Site Plan Review Committee shall ensure that the proposed project complies with</p>
	<p><b>COMMENTS:</b> The policy to involve community members in planning decisions that will affect the area in which they live is commendable, however, both the proposed new Policy 1.4 and IM-5 appear to apply only in very limited circumstances, i.e., when new development outside an existing Development Boundary will be coterminous with that Boundary.</p> <p><b>Why has the policy been framed only to apply when a proposed project is coterminous with a Development Boundary?</b></p>	
FGMP-1.5	<p>The County shall encourage new development be designed in a manner that preserves the visual quality of the foothill setting by encouraging the use of curvilinear streets, vegetation reestablishment on cuts and fills, cluster development, and housing site locations that blend into the landscape rather than becoming a focal point.</p> <p>IM-7. The Site Plan Review Committee shall review the consistency of the project with the location, type of design criteria of the County's policies for projects that only require Site Plan Review. Should the project not meet the County's policies, findings to that effect shall be forwarded to the appropriate decision-making body.</p> <p>ORIGINAL LANGUAGE: [The Site Plan Review Committee shall determine the consistency of the project with the location, type and design criteria of</p>	<p>Better: The County shall require new development to be designed in a manner that preserves the visual quality of the foothill setting through the use of curvilinear streets, vegetation reestablishment on cuts and fills, cluster development, and housing site locations that blend into the landscape rather than becoming a focal point.</p> <p>Better: IM-7. Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

	[New development shall be designed in a manner that preserves the visual quality of the foothill setting by encouraging the use of curvilinear streets, vegetation reestablishment on cuts and fills, cluster development, and housing site locations that blend into the landscape rather than becoming a focal point.]	the policy. Should the project not meet the intent of the above policy, findings to that effect shall be forwarded to the appropriate decision-making body. THE IM THAT APPLIED TO NEW DEVELOPMENT GENERALLY SAYS "The Site Plan Review Committee shall insure that the design of the proposal meets the policies and development standards of the FGMP."]	the policies of this General Plan Update, the Foothill Growth Management Plan, and with the County's Development Standards for the proposed project location. No project that does not meet the County's policies and standards shall be approved or recommended for approval.
FGMP 1.5	<p><b>COMMENTS:</b> While what's left of the policy language carried forward from the existing FGMP is still good, proposed Policy 1.5 has stripped the current Policy, Goal 3 Policy 3, of its force by replacing the mandatory language ("New development SHALL be designed ") with the ineffective admonition to "encourage" new development to employ the cited design criteria. <b>Why has the policy been weakened? The County promised it had not changed the FGMP.</b> Please explain 1) why this provision was revised to weaken it; 2) what the potential direct, indirect, and cumulative impacts of changing this provision will be; 3) how the potential direct, indirect, and cumulative impacts of new development that chooses not to respond to the County's "encouragement" on the visual resources of the foothills have been or will be measured; 4) what new baseline data has been compiled on the potential direct, indirect, and cumulative impacts of such development; and 5) how the County will mitigate the potential direct, indirect, and cumulative impacts resulting from the weakening of this provision. Please also provide the analysis and rationale underlying the decision to change the provision from a mandatory one. Finally, <b>Please restore the original intent and language.</b></p> <p>The proposed revision indicates that IM-7 is the same as the Implementation Measure for this policy in the current FGMP. In fact, the IM cited ("page 25") does not refer at all to the visual quality of the foothills or the design elements set out in new Policy 1-5: it implements a policy dealing specifically with neighborhood commercial centers and the criteria for such centers. Moreover, even in that context, the IM had more "teeth" – as it exists now, the Site Plan Review Committee <i>shall determine</i> the consistency of the project, not simply "review" it.</p> <p>The IM that <i>does</i> correspond to original policy dealing with new development in general, is found on page 24 of the 1981 FGMP and provides "The Site Plan Review Committee <b>shall insure</b> the design of the proposal meets the policies and development standards of the FGMP." (FGMP Page 24)</p> <p><b>Please restore the appropriate IM to this policy, it its original form.</b></p> <p>Additionally, this proposed revision of the FGMP has deleted the entire section in the 1981 FGMP that set out the Site Plan Review process as it applies to the FGMP; without this section, the Implementation Measures that rely on actions of the Site Plan Review process or the Site Plan Committee are meaningless.</p> <p>(Note: as revised, the language of IM-7 is also confusing. What does "type of design criteria of the County's policies" mean? It appears that some language from this IM was omitted.)</p>

I19-147

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

	<p>neighborhood". The Revised FGMP has removed this limitation, and will permit any developments "that provide neighborhood services" – which may be interpreted to mean any commercial enterprise as long as customers are drawn from the undefined "neighborhood." The language "neighborhood-related services" is vague and broad. What does this mean? The current language, "of a size and type to service a neighborhood", gives more guidance. This provision is especially relevant since the proposed new language doubles the permitted size of a neighborhood commercial center from 5 acres to 10 acres, thus making the center much larger than one designed to provide only neighborhood-related services. The current language signals the rural character of permitted commercial activities - it should be restored.</p> <p>What is the average size in acres of existing neighborhood commercial centers in the Foothills? Why is 5 acres no longer adequate?</p> <p>IM-7 doesn't implement the very specific elements set out in the policy. The criteria set out in FGMP-1.6 should be set out in an IM</p> <p>See also comment and proposed revision to IM-7 at FGMP 1.5, above.</p> <p>Why must the major tenant of every neighborhood commercial center be a grocery store? This requirement will result in an overabundance of grocery stores (unlikely, as grocery stores are expensive businesses to establish and maintain) or fewer neighborhood services – such as local restaurants, laundromats, offices, etc. – made available.</p> <p>What are the uses outlined in the PD-F zone?</p>
FGMP-1.7	<p>The County shall encourage commercial recreation uses near unique natural features, thus enabling the visiting public to enjoy the recreational and visual amenities the area has to offer. Criteria for the location and approval of commercial recreation are as follows:</p> <ul style="list-style-type: none"> <li>• The use shall have access from a State Highway</li> <li>• The use shall meet the policies and development standards of the FGMP</li> <li>• The use shall not detract from the visual amenities of the foothills. Landscaping, sufficient setback distances, and well designed buildings and signs are tools that shall be used to protect the visual environment, and</li> </ul> <p>IM-7. The Site Plan Review Committee shall review the consistency of the project with the location, type of design criteria of the County's policies for projects that only require Site Plan Review. Should the project not meet the County's policies, findings to that effect shall be forwarded to the appropriate decision-making body.</p> <p>Better: The County shall support commercial recreation uses located near unique natural features that enable the visiting public to enjoy the recreational and visual amenities the area has to offer. To ensure that the natural beauty of the foothills is preserved consistent with this Goal, Commercial recreation uses shall:</p> <ul style="list-style-type: none"> <li>• have access from a State Highway</li> <li>• meet the policies and development standards of the FGMP</li> <li>• not detract from the visual amenities of the foothills</li> <li>• employ landscaping, sufficient setback distances, and well designed buildings and signs that protect the visual environment,</li> </ul>

I19-147 cont'd

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

	<ul style="list-style-type: none"> <li>Proposed commercial recreation shall be consistent with uses outlined in the Planned Development-Foothill Zone</li> </ul>	<ul style="list-style-type: none"> <li>and be consistent with uses provided for in the Planned Development-Foothill Zone when located in such Zone</li> </ul> <p>Better: IM-7. The Site Plan Review Committee shall ensure that the proposed project complies with the policies of this General Plan Update, the Foothill Growth Management Plan, and with the County's Development Standards for the proposed project location. No project that does not meet the County's policies and standards shall be approved or recommended for approval. (NOTE - for this proposed revision to have any effect, the section setting out the Site Plan Review Process must be restored to the FGMP.)</p>
		<p><b>COMMENTS:</b> New policy 1-7 has materially changed Goal 3 Policy 7 of the 1981 FGMP by deleting the current requirement that commercial recreation uses "shall be located in close proximity to unique natural features" to a policy that promotes such uses ("County shall encourage commercial recreation uses near unique natural features.") The change in language alters the purpose of the policy from establishing a limitation on commercial locations (i.e., requiring commercial recreation uses to be located close to the natural feature they plan to exploit) to a policy urging the County to encourage new commercial ventures near such features.</p> <p>Please explain 1) why this provision was changed to alter its focus; 2) what the potential direct, indirect, and cumulative impacts of changing this provision will be on traffic patterns, air quality, wildlife and human populations and habitat, and on the natural features located in the foothills; 3) how the potential direct, indirect, and cumulative impacts of this change have been or will be measured; 4) what baseline data has been compiled on the potential direct, indirect, and cumulative impacts of such a change; and 5) how the County will mitigate the potential direct, indirect, and cumulative impacts on fragile natural features and the foothill population (human and wildlife) resulting from implementation of this provision. Please also provide the analysis and rationale underlying the decision to change the provision.</p> <p>Implementation measures should provide specific measurable criteria on which compliance can be evaluated -- .How do you implement "encouragement"?</p> <p>As revised IM-7 divests the Site Plan Review Committee of its authority to <b>determine</b> the consistency of a project with the standards set out in the policy (now 1.7) by changing the language to "shall <b>review</b>". IM-7 has also been re-written to replace the current "the intent of the above policy" with "the County's policies" - which suggests that the FGMP is no longer the controlling policy. Finally, IM -7 doesn't provide any real guidance as to the type of landscaping to be</p>

Bodner/Olecki Comments on

May 27, 2010

	employed, the minimum setback distance, etc. See also comment and proposed revision to IM-7 at FGMP 1.5, above.  This revision of the FGMP has also deleted the entire section in the 1981 FGMP that set out the Site Plan Review process as it applies to the FGMP; without this section, the Implementation Measures that rely on actions of the Site Plan Review process or the Site Plan Committee are meaningless.  <b>SEE ALSO discussion of Impacts 3.1-3, 3.1-4 and 3.1-5, which cite this policy and IM in mitigation of the GPU's Significant Unavoidable environmental impact, below.</b>		
FGMP-1.8	The County shall encourage mobile home projects to locate and be designed in a manner that is compatible with existing development patterns and does not detract from the visual amenities of the foothill environment.	NO IMPLEMENTATION MEASURE	
	<p><b>COMMENTS:</b> New Policy 1.8 weakens the existing FGMP policy, which uses the mandatory "shall" to REQUIRE mobile home projects to be located and designed in a manner compatible with existing development patterns and that does not detract from the visual amenities of the foothill environment, to a policy which simply requires the County to "encourage" compliance with the policy. How do you implement "encouragement"?</p> <p>Please explain 1) why this provision was revised to weaken it; 2) what the potential direct, indirect, and cumulative impacts of changing this provision will be; 3) how the potential direct, indirect, and cumulative impacts of the new, more lenient policy have been or will be measured; 4) what data has been compiled on the potential direct, indirect, and cumulative impacts of the revision; and 5) how the County will mitigate the potential direct, indirect, and cumulative impacts resulting from the weakening of this provision. Please also provide the analysis and rationale underlying the decision to change the provision from a mandatory one.</p> <p>Please reinstate the language of the existing FGMP, which more accurately furthers the stated goal of maintaining the natural beauty of the foothills while still allowing focused growth.</p> <p>FGMP 1.8 has no Implementation Measure. <b>The State of California General Plan Guidelines<sup>17</sup> require at least one implementation measure for each policy.</b> FGMP 1.8 fails to meet the minimum standard under the Guidelines.</p>		

<sup>17</sup> The State of California General Plan Guidelines 2003, Governor's Office of Planning and Research, at page 16. Referred to hereinafter as "the Guidelines" or "Guidelines". Implementation Measures are actions, procedures, programs or techniques that carry out a policy, and should provide specific measurable criteria on which compliance and progress can be evaluated.

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

	<p>The lack of an Implementation Measure also makes it impossible to evaluate the environmental impact the policy will have, good or bad, as required under CEQA. As a result, any and all citations to this policy and/or IM in the RDEIR in mitigation of an environmental impact are baseless and unreliable.</p> <p>Why has the Implementation Measure associated with this policy in the 1982 FGMP ("The Site Plan Review Committee shall review mobilehome parks and subdivisions to encourage designs that "fit" into existing development patterns") been deleted?</p>		
FGMP-1.9	<p>The County shall allow light industrial uses in a development corridor subject to a special use permit, planned development, or other equivalent plan. A decision on these uses shall be based on, but not limited to, criteria such as land use conflicts, water requirements, design/location and liquid waste disposal.</p>	<p><b>NO IMPLEMENTATION MEASURE</b></p>	<p>Proposed Modification of original Policy: The County shall determine whether to grant a conditional use permit for proposed light industrial uses within a development corridor on the basis of specific data obtained through the environmental impact report process.</p>
	<p><b>COMMENTS:</b> New Policy 1.9 has materially changed New Development Policy 10 in the current 1981 FGMP by weakening the County's ability to evaluate proposed light industrial uses on their own merits, in the proposed locational context, by changing the current discretionary policy ("The County MAY ALLOW") to a policy that makes allowance of light industrial uses mandatory<sup>18</sup> ("The County SHALL ALLOW"). The revision has also exchanged the previously required conditional use permit for a special use permit.</p> <p>Please explain why this provision was revised to remove the County's discretion in approving light industrial uses in foothill development corridors and made such approval mandatory. Please also explain 1) what the potential direct, indirect, and cumulative impacts of changing this provision will be; 2) how the potential direct, indirect, and cumulative impacts of this mandatory approval measure have been or will be measured; 4) what baseline data has been compiled on the potential direct, indirect, and cumulative impacts of such potential development; and 5) how the County will mitigate the potential direct, indirect, and cumulative impacts resulting from the weakening of this provision. Please also provide the analysis and rationale underlying the decision to change the provision from a discretionary to a mandatory one.</p> <p>The language of Policy 1.9 is also internally inconsistent, as the mandatory "SHALL ALLOW" in the first sentence makes the decision criteria set out in the second sentence on which discretionary decisions could be made irrelevant.</p> <p><b>Please restore the original language.</b></p>		

<sup>18</sup> See Tulare County Ordinance Code §145(a), Definitions. ("Shall" is mandatory and "may" is permissive.)

I19-151

	<p>New Policy 1.9 is further deficient: How do you implement any policy without an implementation measure? The Guidelines require at least one implementation measure for each policy. FGMP 1.9 fails to meet the minimum standard under the Guidelines.</p> <p>The 1981 FGMP IM for this policy provided strong guidance: "The environmental impact report process is the mechanism which will provide specific data both to the Site Plan Review Committee and the Planning Commission for purposes of determining a decision on the conditional use permit." <b>Please reinstate the 1981 Implementation Measure (as modified above.)</b></p> <p>The lack of an Implementation Measure also makes it impossible to evaluate the environmental impact the policy will have, good or bad, as required under CEQA. As a result, <b>any and all citations to this policy and/or IM in the RDEIR in mitigation of an environmental impact are baseless and unreliable</b></p>		
FGMP-1.10	<p>The County shall limit residential densities within the development corridor areas of Success Valley in order to avoid conflicts with intensive agricultural uses in the Valley.</p>	<p>IM-21. The County shall maintain the two areas within Success Valley of the Tule River development corridor on the Land Use/Circulation Plan to a classification (zone), which prohibits any residential densities greater than one unit per five acres.</p>	<p>Better: IM -21. The County shall limit residential density in the two Success Valley areas within the Tule River Development Corridor (on the Land Use/Circulation Plan) to one unit per five acres.</p>
	<p><b>COMMENTS:</b> This policy and IM have been in effect since 1981; the implementation timeline shows the anticipated attainment date as "ongoing." Please indicate whether the required zoning has been implemented</p>		
FGMP-1.11	<p>The County shall require that hillside development be designed so as to preserve the skyline and maintain an unobstructed scenic panorama of the foothills.</p>	<p>IM-13. The County shall ensure that the design of subdivision is reviewed by the Site Plan Review Committee to assure the visual impact to the foothills is minimal.</p>	<p>Better: IM-13. The County shall not approve any development or other improvement that will be situated on a hillside in such a way that the finished construction will be visible from areas accessible to the public. Hilltop construction shall not be approved.</p>
	<p><b>COMMENTS:</b> IM-13 deals only with the design of subdivisions, and even then permits hillside development that will disturb the skyline so long as the disturbance is considered "minimal." Please explain how IM-13 implements Policy 1.11, when it is limited in scope to subdivisions, and when it provides no guidance in determining whether a visual impact may be considered "minimal."</p> <p>This revision of the FGMP has deleted the entire section in the 1981 FGMP that set out the Site Plan Review process as it applies to the FGMP; without this section, the Implementation Measures that rely on actions of the Site Plan Review process or the Site Plan Committee are meaningless.</p>		

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

	<p>"Minimizing" is not "preserving"</p> <p>An appropriate IM for this policy would not be limited to subdivisions, and would direct the County to develop zoning standards that specifically prevent hilltop or hillside development that will interrupt the natural skyline of the foothills. Please revise</p>		
FGMP-1.12	<p>The County shall designate existing, legally conforming commercial uses not located in the communities of Springville and Three Rivers with an appropriate land use designation, providing the use is consistent with other policies in this FGMP.</p>	<p>IM-8. Substantial improvement or expansion to commercial uses not located in Three Rivers, Springville, and Lemon Cove shall conform to the development standards contained in the FGMP.</p>	<p>PROPOSED REVISION: The County shall identify all existing foothill commercial uses not located in the communities of Springville and Three Rivers and evaluate each such existing uses for compliance with the policies of this FGMP and GPU. Appropriate land use designations shall be assigned to all such uses that are found to be legal conforming commercial uses. Uses which do not conform to the policies of this FGMP and GPU shall be given the opportunity to come into compliance (where possible) or shall be directed to cease operation within a reasonable time.</p>
	<p><b>COMMENTS:</b> This policy has been changed from a <i>permissive</i> "legally conforming commercial uses .... <i>may</i> be recognized with an appropriate use designation providing the recognized use is consistent with other policies in the FGMP" to a mandatory "County <i>shall designate</i>." <b>Why has the County's discretion to determine appropriate land use designations been removed and replaced with a mandate?</b></p> <p>Please explain the analysis and rationale behind this change divesting the County of discretion in this land-use determination. What is its anticipated direct, indirect, and cumulative impact, and on what data is this expectation based?</p> <p>The 1981 Policy is implemented by two Implementation Measures (page 22): "Under Level III of the FGMP, existing commercial uses may be shown as commercial on the land use map," and "Substantial improvements to <i>existing</i> zoned commercial uses . . . shall conform to the development standards contained in the FGMP."</p> <p>Although IM-8 retains half of the measures that previously controlled how the policy was enforced, it has deleted the important word "existing." More importantly, however, it does not really implement Policy 1.12: the policy directs the County to give appropriate designations to existing, legally conforming uses in the FGMP area, and does not deal with improvements (substantial or otherwise) or expansion of those uses. IM-8 on the other hand, deals only with improvements or expansion of commercial uses, requiring them to conform to FGMP standards.</p> <p>Please revise IM-8 to appropriately implement Policy 1.12.</p>		

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

	The substance of IM-8 is good and should be made a policy in its own right, with an appropriate IM of its own.	
FGMP-1.13	Planned development within the foothills may be located within development corridors on lands designated Foothill Mixed use (FMU) and zoned Planned Development-Foothill Combining-Special Mobile Home Zone (PD-F-M), or within development corridors delineated on a Master Development Plan, established in compliance with the FGMP first and second level planning criteria, where an area has been designated as a Planned Community Area (PCA) in the FGMP and zoned Planned Community (PC) pursuant to requirements of the Tulare County Planned Community (PC) Zoning Ordinance. PCA land uses shall included [sic] equivalent General Plan land use designations allowed within UDBs.	<b>NO IMPLEMENTATION MEASURE</b>
	<p><b>COMMENTS:</b> Policy 1.13 is so confusing that it fails to provide comprehensible guidance to the public. It is also inconsistent with other FGMP policies.</p> <p>As revised, policy 1.13 permits development on lands designated FMU and lands zoned Planned Development -Foothill Combining-Special Mobile Home Zone OR within development corridors delineated on a Master Development Plan. It is thus inconsistent with FGMP Policy 1.1, which specifically restricts new development to development corridors delineated within a Master Development Plan. Since Master Development Plans are referenced only in connection with Planned Communities to be formed on plots in excess of 200 acres. Moreover, in limiting PCA compliance with the FGMP to Levels I and II, it completely removes PCA developments from the FGMP resource-based analysis of site and project suitability required under Levels III and IV. As noted even in this revised FGMP, this process is a "critical component to the implementation of the FGMP." At Part II, page 3-4. <b>This revised policy is inconsistent with the intent, and other policies, of the FGMP. Please revise to bring it into compliance.</b></p> <p>In addition, by providing that Planned Community Area land uses shall include "equivalent General Plan land use designations allowed within UDBs," it is unclear whether the foothill-specific development standards will apply. (This also creates an inconsistency with Policy 1.14, which does reference the FGMP standards.)</p> <p>Finally, there is no Implementation Measure for Policy 1.13, which makes the policy meaningless and unenforceable. The Guidelines require at least one implementation measure for each policy. Accordingly, FGMP 1.13 fails to meet the minimum standard under the Guidelines</p>	

	The lack of an Implementation Measure also makes it impossible to evaluate the environmental impact the policy will have, good or bad, as required under CEQA. As a result, <b>any and all citations to this policy and/or IM in the RDEIR in mitigation of an environmental impact are baseless and unreliable.</b>	
FGMP-1.14	For Planned Community Areas within the foothills, the Planned Community (PC) Zone shall be used. Development corridors shall be delineated through the Master Development Plan (MDP) process. The MDP shall clearly demonstrate how "First and Second Level" FGMP planning criteria are or can be met. Lands that fail to meet these criteria for development will be protected for open space uses.	<b>NO IMPLEMENTATION MEASURE</b>
	<p><b>COMMENTS:</b> To ensure compliance with the FGMP, please change the word "will" to "shall". "Will" signifies only a prediction that lands will be protected for open space uses, while "shall" requires the County to comply,</p> <p>Because there is no Implementation Measure for Policy 1.14, this provision fails to meet the minimum standards required under the Guidelines. At least one implementation measure is required for each policy.</p> <p>The lack of an Implementation Measure also makes it impossible to evaluate the environmental impact the policy will have, good or bad, as required under CEQA. As a result, <b>any and all citations to this policy and/or IM in the RDEIR in mitigation of an environmental impact are baseless and unreliable.</b></p>	
FGMP-1.15	For Planned Community Areas and Development Corridors within the foothills, road linkages may be used to provide for continuity of otherwise discontinues [sic] development corridors, provided that new road construction is consistent with all other requirements of the General Plan.	<b>NO IMPLEMENTATION MEASURE</b>
	<p><b>COMMENTS:</b> Policy 1.15 appears to be an attempt to overcome the objection that development of new communities ("planned" or otherwise) that are discontinuous with, and not natural outgrowths or expansions of, existing communities create urban sprawl. However, simply building new roads to connect otherwise scattered developments ("provide continuity") does not ameliorate the problems associated with leapfrog development, and in fact exacerbates the problem by creating more traffic-inducing roadways. The cumulative impact of such roads, connecting an unspecified number of discontinuous new developments, has not – but must be – assessed to adequately determine the environmental impact of the construction.</p> <p>A more appropriate policy would require that Development Corridors be designated only where there are already existing road linkages. Please revise.</p>

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

	<p>Happily, there is no Implementation Measure for this Policy, so it is unenforceable as well as inadequate under the Guidelines. Please create an appropriate IM to implement the revised policy.</p> <p>The lack of an Implementation Measure also makes it impossible to evaluate the environmental impact the policy will have, good or bad, as required under CEQA. As a result, <b>any and all citations to this policy and/or IM in the RDEIR in mitigation of an environmental impact are baseless and unreliable.</b></p>		
FGMP-1.16	<p>Unless it can be demonstrated that an alternative standard will result in attainment of a superior environment, when preparing Specific Plans, Master Development Plans, or Area Development Plans and standards therein for areas within the foothills, at a minimum, the development standards within the FGMP Appendix shall apply.</p>	<p>IM-8. Substantial improvement or expansion to commercial uses not located in Three Rivers, Springville, and Lemon Cove shall conform to the development standards contained in the FGMP.</p>	.
	<p><b>COMMENTS:</b> NOTE: FGMP Development Standards are set out in Section 3.12, not an Appendix.</p> <p>Policy: How is "superior environment" to be measured? Criteria?</p> <p>IM-8 doesn't implement Policy 1.16 as it applies only to substantial improvement to or expansion of commercial uses, whereas Policy 1.16 applies to all development in the designated areas.</p> <p>Both FGMP- 1.16 and its implementation measure must be revised to provide measurable guidelines</p>		
<b>Goal 2</b>	<p><b>To strengthen and ensure the existing community values and identity in Springville Three Rivers Lemon Cove and the Badger Development Corridor, as development proceeds.</b></p>		
FGMP-2.1	<p>The County shall encourage new commercial development to first consider the communities of Springville, Three Rivers, and Lemon Cove, which are suitable for commercial development. For Planned Community Areas within the foothills, commercial areas will be designated within the development corridors through the Master Development Plan process.</p>	<p>IM-9. The County shall ensure that the land use and circulation plan for a development corridor will limit retail commercial development designations outside Three Rivers, Springville, and Lemon Cove unless determined to be appropriate and acceptable as included in a Master Development Plan.</p>

I19-158

	<p><b>COMMENTS:</b> Policy: In changing the language of the provision to require the County only to "encourage" consideration of these communities, the Revised FGMP has shifted the decision-making power from the County – which formerly could determine where a proposed enterprise would be appropriate based on all relevant factors – to the commercial enterprise, which most likely is not in possession of all the information available to the County. Please explain the analysis and rationale for shifting the decision-making power (which in effect is a basic land-use determination) away from the County. Please also explain 1) what the potential direct, indirect, and cumulative impacts of changing this provision will be; 2) how the potential direct, indirect, and cumulative impacts have been or will be measured; 3) what baseline data has been compiled on commercial location decision-making; and 4) how the County will mitigate the potential direct, indirect, and cumulative impacts resulting from the deletion of this provision.</p> <p>How does encouraging new commercial development strengthen and ensure existing community values and identity? If it is assumed that it does further the goal by strengthening a community's local economy, the new policy language regarding Planned Community Areas is inherently inconsistent with the goal, as it neither follows from nor relates to encouraging development first in Three Rivers, Springville, Lemon Cove or the Badger Development Corridor, and in fact undermines the policy by permitting commercial development in new planned community developments (which would be the subject of any Master Development Plan). Construction of commercial structures will almost always be easier when done in connection with completely new development rather than as infill construction. The likely result of permitting development of new towns, including commercial development within those towns, in the foothills will be that it will be increasingly difficult to encourage commerce to locate in the existing towns.</p> <p>Accordingly, FGMP-2.1 doesn't promote the goal of strengthening and ensuring the values and identities of Springville, Three Rivers, Lemon Cove or Badger. The language re: PCAs should not be part of this policy statement.</p> <p>IM -9 - rather than encouraging commercial development to locate in the existing towns, IM-9 simply enables "appropriate and acceptable" commercial development to be included in a Master Development Plan. Development Corridor without providing any specific means of determining what is "appropriate" or "acceptable." A new Implementation Measure should be drafted that sets out specific measures the County will take to achieve the policy.</p>
FGMP-2.2	<p>The County shall maintain appropriate zoning within the Badger Development Corridor in order to promote residential densities compatible with established land use patterns.</p> <p>IM-11. The County may initiate changes in the FGMP specifically for the Badger Development Corridor to accommodate uses of property and densities not presently reflected in the FGMP, so long as specific plans for development and densities have been prepared and are available for review at the time the Commission initiates consideration of the plan change.</p>
	<p><b>COMMENTS:</b> What are the "established land use patterns" within the Badger Development Corridor? No such patterns or zones are shown on either the Badger/Elderwood Development Corridor Map (Figure 3-2) or the GPU Land Use Map; without documentation of existing land use patterns it will be impossible to assess either the progress toward achieving the goal, or the environmental impact of implementing the Plan.</p>

Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

I19-158 cont'd

I19-159

I19-160

	<p>Rather than implementing Policy 2.2, IM-11 implements changes by authorizing the County to initiate changes to accommodate uses and densities not contemplated in the FGMP. The provision that "specific plans for development and densities" must have been prepared and made available for review provides no guidance as to what must have been provided as part of those plans, and no assurance that the proposed development will be consistent with either the intent or the specific policies of the FGMP.</p> <p>Please explain why this policy and IM depart so radically from the overall policies of the FGMP. What opportunities will be afforded for public review and input into proposed changes? What are the "uses" and densities that may be proposed and/or permitted? What demonstrated need supports what is in essence a nullification of the FGMP in the Badger/Elderwood corridor? What are the direct and reasonably foreseeable indirect effects of the proposed changes?</p> <p>This policy and IM have been in effect since 1981, and the implementation timeline shows this policy and IM as "ongoing." Please disclose what changes have been made since the adoption of the 1981 FGMP. FGMP 2.2 cites "Amendment 83-03. New Development, Modification to Adopted Element" – why is this Amendment to the FGMP not included as part of the FGMP, and why are any changes not disclosed on the land use map and/or FGMP map so that the public and planners are aware of the FGMP as currently constituted?</p> <p>How does IM-11 relate to Policy FGMP-2.3 and IM-10?</p> <p>This IM does not meet the minimum requirements of Guidelines.</p>		
FGMP-2.3	<p>The County shall limit the maximum residential density of areas within the Badger Development Corridor to one (1) dwelling unit per five (5) acres.</p>	<p>IM-10. The County shall maintain appropriate zoning within the Badger Development Corridor which requires a 5-acre minimum parcel size.</p>	
	<p><b>COMMENTS:</b> At last! One that actually seems appropriate! BUT! Why do this policy and IM depart from the overall FGMP approach of basing development on environmental factors such as water availability, slope, vegetation, landmarks, watercourses, etc.? If background data exist to support these densities and parcel sizes, please include them in the revised FGMP. If such background data don't exist, how will the County assess progress toward achieving the goal, or the environmental impact of implementing the Plan?</p>		
<b>Goal 3</b>	<p><b>To ensure that new development be designed in a manner which minimizes impact to foothill areas including grading, vegetation disturbance, tree removal, and intrusion onto natural</b></p>		

<b>watercourses, canyons, and prominent landmarks, or rare and endangered species sites, and protects the County's dark skies.<sup>19</sup></b>		
FGMP-3.1	<p>The County shall encourage innovatively-designed residential development in the foothills, such as planned unit or cluster development that conserves and preserves surrounding open space from unnecessary disturbances.</p> <p>IM-7. The Site Plan Review Committee shall review the consistency of the project with the location, type of design criteria of the County's policies for projects that only require Site Plan Review. Should the project not meet the County's policies, findings to that effect shall be forwarded to the appropriate decision-making body.</p>	<p>PROPOSED REVISION: The County shall require development in the foothills, whether residential or commercial, to employ innovative design, such as planned unit or cluster development, and to meet LEED-ND or LEED-NC standards to conserve and preserve surrounding open space from unnecessary disturbance.</p> <p>PROPOSED REVISION: The County shall adopt the LEED-NC and LEED-ND design standards and guidelines for development in the foothills which will require development to follow smart growth principles such as, but not limited to, planned unit or cluster development, and to conserve and preserve surrounding open space from unnecessary disturbance. minimize grading, vegetation disturbance, and intrusion onto natural watercourses, canyons, or areas which host rare or endangered species of prominent landmarks.</p>
	<p><b>COMMENTS:</b> Policy: while this policy is basically a good one, it would be more effective if revised to require new developments to comply with LEED-ND standards. It should also be clarified to establish that the term "residential development" is not limited to developments of whole neighborhoods, but also applies to individual construction, which should be required to meet LEED-NC standards in order to minimize the identified impacts.</p> <p>IM-7 does not implement this policy – although the direction to "encourage" is inherently weak itself, the passive review of proposals already submitted for Site Plan Review does not even "encourage" innovative design. Strong, specific design standards that make clear the County's intention to require innovative design would allow developers to present appropriately designed projects in the first instance, thus saving both the County and the developer time and money.</p>

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

<p>FGMP 3.2 cont'd</p>	<p><b>COMMENTS:</b> This policy is a mess.</p> <p>INITIAL INCONSISTENCY: Policy 3.2 relies on mitigation measures "as identified in the ERM Section 8.2: Mineral Resources - Surface Mining and 8.3: Mineral Resources - Other." <b>Section 8.2 contains 13 policies and 21 Implementation Measures, all but two of which seek to facilitate exploitation of mineral deposits; Section 8.3 contains 5 policies and 2 Implementation Measures, only one of which mentions environmental impacts, and none of which sets out criteria that could be used to mitigate such impacts. (The one that does simply requires an analysis under CEQA, which would be required anyway.) NOTE: only one of the five policies in ERM Section 8.3 has an Implementation Measure.</b></p> <p><b>Why has new FGMP-3.2 weakened</b> the County's ability to evaluate the appropriateness of proposed excavation operations by changing the current discretionary policy ("The County MAY ALLOW") to a policy that makes allowance of rock, sand and gravel excavation operations mandatory ("The County SHALL ALLOW")? The language of Policy 3.2 is also internally inconsistent, as the new mandatory "SHALL ALLOW" in the first sentence makes the decision criteria set out in the second sentence (on which discretionary decisions should be made) both meaningless and irrelevant.</p> <p>Mining and excavation activities have both temporary, short term as well as long-term, permanent environmental impacts. The County should not be REQUIRED to grant permission for such excavations. The 1981 policy required a <u>conditional use permit</u>; the revised policy requires a <u>mining permit</u>. <b>Why was this requirement changed, and what are the implications and impacts of the change?</b></p> <p>The current, 1981 plan also specifies that it the policy will be implemented through the "environmental impact report process" (p. 27 of 1981 FGMP). This IM properly addresses the concerns shared both by Foothill residents and CEQA. <b>Why has it been deleted?</b></p> <p>New FGMP 3.2 is also weaker than the policy from which it is drawn because as revised, it no longer requires the County to consider short-term environmental, social and economic impacts when considering a request for a Surface Mining Permit. These elements are highly relevant to CEQA analysis and should be restored.</p> <p>New Policy 3.2 is even further deficient: it cannot be enforced without an implementation measure. The Guidelines require at least one implementation measure for each policy. FGMP 3.2 fails to meet the minimum standard under the Guidelines.</p> <p>The lack of an Implementation Measure also makes it impossible to evaluate the environmental impact the policy will have, good or bad, as required under CEQA. As a result, <b>any and all citations to this policy and/or IM in the RDEIR in mitigation of an environmental impact are baseless and unreliable.</b></p>

May 27, 2010

I19-161 cont'd

I19-162

I19-163

	Please explain what effect the change from a conditional use permit to a mining permit will have. Why was consideration of social and economic impacts of such excavation operations removed from the factors that must be considered before approving the permit? Please also explain 1) what will the potential direct, indirect, and cumulative impacts of changing this provision overall be; 2) how the potential direct, indirect, and cumulative impacts have been or will be measured; 4) what data has been compiled on the potential direct, indirect, and cumulative impacts of such activities, especially as concerns social and economic concerns. Please also provide the analysis and rationale underlying the decision to change the provision from a mandatory one.		
FGMP-3.3	The County shall ensure that development proposals conform to all standards related to the Foothill Mix [sic] Use designation and the FGMP Development Standards.	IM -20. The County shall ensure the Zoning Ordinance maintains the Planned Development-Foothill (PD-F-M) Zone which will be applied to properties in a development corridor that are suited for development.	
	<p><b>COMMENTS:</b> How does IM-20, which relates only to maintenance of the PD-F-M Zone, implement the policy, which requires that development proposals conform to FGMP Development Standards and the Foothill Mixed Use standards?</p> <p>Does "development" as used in Policy FGMP-3.3 refer only to large-scale developments? How will IM-20 ensure that the FGMP Development Standards are met for single buildings or small scale (i.e. non Planned Development) projects?</p>		
<b>Goal 4</b>	<b>To provide recreational and open space opportunities both for local residents and for the visiting public.</b>		
FGMP-4.1	The County shall identify and protect those environmentally sensitive areas in the foothill development corridors which should be maintained as open space, such as areas characterized by floodplains, steep slopes (30 percent or greater), unstable geology, unique archaeological/historical sites, habitat of special status species, and scenic vistas.	NO IMPLEMENTATION MEASURE	
	<b>COMMENTS:</b> Policy 4.1, while essentially a good one, does not further the goal of providing recreational and open space opportunities. It is also limited insofar		

I19-163 cont'd

	<p>as it applies only to areas in development corridors. Since Planned Community Areas are not at this time limited to areas within development corridors, and may be permitted anywhere in the foothill region, it is crucial that environmentally sensitive areas throughout the region be identified and protected.</p> <p><b>Please revise the policy to encompass the entire foothill region instead of just areas within development corridors.</b></p> <p>As restated in the GPU, Policy 4.1 has also changed the previous reference to "special wildlife species" to "special status species." The previous designation permitted the County to determine that a species was "special" whether or not it qualifies for formal protection as a "special status" species. As revised, the County no longer has the ability – or the obligation – to do this. The language of the 1981 FGMP is environmentally superior.</p> <p>Policy 4.1 is more appropriately a policy under Goal 8 (Environment Protection). Please move the policy accordingly and <b>provide Guidelines-compliant implementation measures for it that directly address identifying and protecting environmentally sensitive areas.</b></p> <p>Finally, the Guidelines require at least one implementation measure for each policy. FGMP 4.1 fails to meet the minimum standard under the Guidelines. The lack of an Implementation Measure also makes it impossible to evaluate the environmental impact the policy will have, good or bad, as required under CEQA. As a result, <b>any and all citations to this policy and/or IM in the RDEIR in mitigation of an environmental impact are baseless and unreliable.</b></p>
--	--

I19-164 cont'd

FGMP-4.2	<p>The County shall encourage private recreational uses in the foothills to help meet future demand for recreational activities, provided they meet the development standards of this FGMP and other County policies.</p>	<p><b>NO IMPLEMENTATION MEASURE</b></p>	
----------	---	---	--

I19-165

	<p><b>COMMENTS:</b> The revised version of FGMP-4.2 fails to meet the minimum standard under the Guidelines, as the Guidelines require at least one implementation measure for each policy.</p> <p>The lack of an Implementation Measure also makes it impossible to evaluate the environmental impact the policy will have, good or bad, as required under CEQA. As a result, <b>any and all citations to this policy and/or IM in the RDEIR in mitigation of an environmental impact are baseless and unreliable.</b></p> <p>In providing an appropriate IM for this policy, please specify how the County will "encourage" and regulate proposed recreational uses to ensure that they are also consistent with the goal of protecting the fragile environment and the beauty of the foothills.</p>
--	--

FGMP-4.3	<p>The County shall not require common open space areas in the foothills to maintain access for the general public except as provided by the developer or owners of the property or where otherwise</p>	<p>IM-15. Unauthorized encroachment in environmentally or archeologically sensitive areas on a project site which are to remain in common open space shall be prohibited.</p>

I19-166

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

	required by the General Plan.	
	<p><b>COMMENTS:</b> Policy: Please clarify: the term "common open space" implies that, by definition, the open space is dedicated to the public. Under what circumstances will the County not require public access to common open space? If the intent of this policy is to protect a private landowner's ability to exclude the public from land designated as open space, please revise the policy by deleting the word "common."</p> <p>IM-15 (without the limitation as to "a project site which [is] to remain in common open space" is more appropriate as a policy, as it establishes a good step in the direction of protecting sensitive areas but is unrelated to, and does not implement, policy FGMP-4.3. Please revise.</p>	
<b>Goal 5</b>	<p><b>To maintain and preserve extensive and intensive agricultural uses in the foothill area.</b></p>	
	<p><b>Despite the GPU's key objective of protecting County agriculture, the Agricultural Lands element of the 1981 FGMP has been decimated in this revision. What was Goal 5 in the 1981 FGMP now appears as both the Goal and the sole FGMP Ag- policy - Policy 5.1 does no more than repeat the language of the goal. Moreover, the revised FGMP fails to disclose that not one of the three current policies has been brought forward to the GPU and misleadingly indicates that FGMP 5.1 is the same as 1981 "Goal 5; Policy 5-1, p. 15." That the prior language has also been weakened by the addition of the words "whenever possible" is also not disclosed.</b></p> <p><b>The deleted policies are:</b></p> <ol style="list-style-type: none"> <li><b>1. Protect extensive and intensive agricultural areas as identified by the FGMP from encroachment on non-agricultural uses through the use of large lot exclusive agricultural zoning.</b></li> <li><b>2. Assure that the Tulare County Zoning Ordinance contains agricultural zones that will protect and enhance the viability of foothill agriculture through the provision of adequate minimum parcel</b></li> </ol>

May 27, 2010

	<p>IM-18. The County shall identify and maintain extensive and intensive agricultural areas, as identified by the FGMP through the use of large lot exclusive agricultural zoning to reduce encroachment of non-agricultural uses.</p> <p>IM-19. The County may require agricultural lands that are in a development corridor and the Planned Development-Foothill Zone to remain in agricultural use, if, under the site plan review process, an inadequate amount of water or improper soils for waste water disposal exists.</p>	
	<p><b>COMMENTS:</b> Policy 5-1 substantially changes Agricultural Lands policy 1 in the 1981 Plan. Where FGMP-5.1 now provides only that "The County shall maintain and preserve extensive and intensive agricultural uses in the foothills", the provision on which it is based provided much more: "Protect extensive and intensive agricultural areas as identified by the FGMP from encroachment of non-agricultural uses through the use of large lot exclusive agriculture zoning." By omitting the statement of means by which these agricultural lands shall be maintained, the FGMP removes one level of protection from these properties. The policy also merely duplicates Goal 5 in a weakened form because of the added words "whenever possible."</p> <p>Given the County's emphasis on preserving agricultural lands, please provide the analysis and rationale behind the modification of this provision. Please also explain 1) what the potential direct, indirect, and cumulative impacts of changing this section will be; 2) how the potential direct, indirect, and cumulative impacts have been or will be measured; 3) what baseline measures of currently existing foothill agricultural land have been compiled; and 4) how the County will mitigate the potential direct, indirect, and cumulative impacts resulting from the weakening of this section.</p> <p>IM-12 is the former Policy 5-2. Because Implementation Measures must be specific, quantifiable measures, the language of the former policy is inadequate to ensure that the policy is carried out.</p> <p>IM-17 and IM-18 are loosely based on current policy 5-1 which provides "Protect extensive and intensive agricultural areas as identified by the FGMP from encroachment on non-agricultural uses through the use of large lot exclusive agricultural zoning."</p> <p>As reformatted, the IMs no longer provide the protection from encroachment of non-agricultural uses provided in the current 1981 policy: today the policy clearly requires the large-lot zoning to apply to areas identified in the FGMP, while IM-17 is vague and does not directly link the zoning requirement to lands within the FGMP. IM-18 further weakens the protection by substituting "identify and maintain" for the current "protect."</p> <p>IM-17 is also unclear - what does "flexible enough to allow for intensive agricultural uses to be divided from larger extensive agricultural uses" mean and why</p>

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

	should intensive agriculture need to be "divided from" extensive agriculture?  IM-18 has also weakened the current policy by replacing the direction to "protect ... agricultural uses... from encroachment" with the weaker "reduce encroachment" of non-agricultural uses, which implies that some unspecified level of encroachment is acceptable.  <b>Please restore 1981 Policies 5.1 – 5.3 as policies with appropriate IMs.</b>
<b>Goal 6</b>	<b>To provide local protection of scenic highways and routes within the foothills.</b>
FGMP-6.1	<p>The County shall ensure that the visual qualities of State Highways 190 and 198 and County scenic routes are maintained and protected against obtrusive development improvements.</p> <p>IM-6. The County shall use the Site Plan Review Committee to ensure that the new development adjacent to scenic highways and roads meets the requirements set forth in the development standards.</p> <p>PROPOSED REVISION: The County shall develop specific standards to govern development or improvements proposed for locations adjacent to scenic highways and roads. The Site Plan Review Committee shall not approve any proposed development or improvement that fails to meet the requirements set forth in the scenic roadways development standards.</p>
	<p><b>COMMENTS:</b> IM-6 is vague and therefore provides little guidance to either planners or the public - to which development standards does it refer? <b>Please specify both the FGMP and the General Plan Scenic Corridors/Scenic Roads standards.</b> As written, the Implementation Measure is also ineffective because it relates only to new development, while the policy covers improvements of any kind – including changes to existing ones. Please revise.</p> <p>The current FGMP implements this policy by requiring the Site Plan Review Committee to review development along scenic highways and roads "to insure that the visual qualities of the thoroughfare are not blighted." However, <b>this revision of the FGMP has deleted the entire section in the 1981 FGMP that set out the Site Plan Review process as it applies to the FGMP;</b> without this section, the Implementation Measures that rely on actions of the Site Plan Review process or the Site Plan Committee are meaningless. <b>Please restore.</b></p> <p>Please provide the analysis and rationale for deleting the Site Plan Review process from the FGMP, and also explain 1) what the potential direct, indirect, and cumulative impacts of the change will be; 2) how the potential direct, indirect, and cumulative impacts have been or will be measured; 3) what data has been compiled to justify the change; 4) how the County will mitigate the potential direct, indirect, and cumulative impacts resulting from the modification of this and other provisions that rely on the Site Plan Review process for implementation.</p> <p><b>SEE ALSO discussion of Impacts 3.1-3, 3.1-4 and 3.1-5, which cite this policy and IM in mitigation of the GPU's Significant Unavoidable environmental impact, below.</b></p>
	Page 70 of 95

I19-169

FGMP-6.2	The County shall continue to seek and identify County routes, which due to their scenic and rural characteristics, should receive a County "scenic routes" designation.	NO IMPLEMENTATION MEASURE	
	<p><b>COMMENTS:</b> The language of this policy has been changed, substituting the word "route" for the word "roads." <b>What is the significance of this change?</b></p> <p>Policy 6.2 is a good beginning but it doesn't go far enough. The County should not only seek and identify scenic routes, it should designate the roads as such so that they become subject to standards designed to protect scenic routes. Simply identifying a route does not provide protection for its unique nature. Please revise.</p> <p>Because there is no Implementation Measure for this policy, it is unenforceable. The Guidelines require at least one Implementation Measure for each policy. Without an Implementation Measure, FGMP 6.2 fails to meet the minimum standard under the Guidelines. Please provide an appropriate Implementation Measure.</p> <p>The current FGMP implements this policy (page 30) by stating "Level III of the FGMP provides for circulation patterns for each of the development corridors. Those roads with unique visual qualities are shown as scenic roads." <b>These roads – Hwy. 245; Hwy 198 from north of Exeter through Three Rivers; M-296/J37 - Yokohl Drive/Balch Park Drive (from Hwy 198 to Hwy. 190); J28 from near Springville to Strathmore; portions of Hwy. 190; Globe Drive near Springville; and J42/Success Drive – were included in maps in the 1981 Plan which have now been deleted, but they do not show up in any of the revised land use maps showing development corridors in the FGMP area, nor are they identified in the body of the revised FGMP. Why have they been deleted? Which, if any, of the designated scenic roads have received official status as County Scenic Roads?</b></p> <p><b>Please explain</b> 1) why these listings were deleted; 2) what the potential direct, indirect, and cumulative impacts of deleting these listings will be on the levels of protection afforded the affected roads; 3) how the potential direct, indirect, and cumulative impacts on scenic roads have been or will be measured; 4) what new baseline data has been compiled on State and County scenic roads; and 5) how the County will mitigate the potential direct, indirect, and cumulative impacts resulting from the deletion of these maps and listings. Please also provide the analysis and rationale underlying the decision to delete the provisions.</p> <p>The lack of an Implementation Measure also makes it impossible to evaluate the environmental impact the policy will have, good or bad, as required under CEQA. As a result, <b>any and all citations to this policy and/or IM in the RDEIR in mitigation of an environmental impact are without foundation and unreliable. SEE ALSO discussion of Impacts 3.1-3, 3.1-4 and 3.1-5, which cite this policy and IM in mitigation of the GPU's Significant Unavoidable environmental impact, below.</b></p>		

I19-170

FGMP-6.3	The County shall require that development along all scenic highways and routes meet the development standards of the FGMP.	IM-6. 	impacts to surrounding areas by locating roadways in areas that minimize the visual impact on rural and natural places whenever feasible.		design of infrastructure in scenic areas to minimize visual impacts to surrounding areas. For example, new roadways or improvement to or expansion of existing roadways shall be located in areas that minimize the visual impact on rural and natural places.
	<p><b>COMMENTS:</b> Because Goal 6 is intended to apply throughout the foothills, the Policy should not be limited in its application to designated scenic corridors, and the requirement should not be weakened by the open-ended phrase "whenever feasible." The Policy should also not be limited in application to "roadways" – it should apply to all improvements or developments, as the goal is to protect the view as seen from the road as well as protecting the view from the road's presence.</p> <p>If the County intends to grant exemptions or exceptions to the policy it should specify the conditions under which such exceptions or exemptions will be considered and how requests will be evaluated.</p> <p>IM-14 is limited in its application to designated scenic corridors. It will not, therefore, further the goal of protecting all scenic roads and highways in the foothills.</p> <p>The IM also does not set out specific, quantifiable measures that will provide guidance as to how the County will "support" the Infrastructure design. What exactly does the "use of [the County's] authority and police powers" mean in this context? How does this language provide guidance to the public or to planners?</p> <p>Finally, IM-14 does not include any measures that implement the policy of locating roadways to minimize visual impact. It thus does not meet the requirements of the Guidelines.</p> <p><b>SEE ALSO discussion of Impacts 3.1-3, 3.1-4 and 3.1-5, which cite this policy and IM in mitigation of the GPU's Significant Unavoidable environmental impact, below.</b></p>		

I19-172

FGMP-6.5	The County shall encourage projects proposed on lands within a scenic corridor with a non-agricultural or non-open space land use designation, to use a cluster development concept. Appropriate land uses for the open space areas shall include, but will not be limited to, public or private open space, wildlife habitat or agriculture.	<p>IM-7. The Site Plan Review Committee shall review the consistency of the project with the location, type of design criteria of the County's policies for projects that only require Site Plan Review. Should the project not meet the County's policies, findings to that effect shall be forwarded to the appropriate decision-making body.</p> <p>IM-14. The County shall promote the use of cluster development, greater setback distances, landscaping, and innovative lot design to protect</p>

May 27, 2010

		scenic corridors within the County. Provisions for the use of these tools shall be incorporated into the County's land development ordinances.	
		<p><b>COMMENTS:</b> Policy 6.5, while generally good, needs significant tightening. <b>How will the County "encourage" the use of cluster development? "Encourage" should be changed to "require."</b> As written it is unclear whether the use of the term "open space" in the second sentence is being used generically (i.e., does it refer to open space within a development?) or whether it refers to the specific land use designation. If the latter, is this a zoning determination? If so, the IM should direct the change to the zoning ordinance. Finally, and again, while the policy is generally a good one it does not really relate to protecting scenic roads and highways, and might be more appropriately a policy under Goal 8.</p> <p>IM-7 See also comment to IM-7 at FGMP 1.5, above, which also applies here.</p> <p>This revision of the FGMP has deleted the entire section in the 1981 FGMP that set out the Site Plan Review process as it applies to the FGMP; without this section, the Implementation Measures that rely on actions of the Site Plan Review process or the Site Plan Committee are meaningless.</p> <p>IM-14 - appears duplicative of the policy itself. How shall the County "promote" the use of these elements? What provision will be incorporated? The Guidelines require IMs to provide measurable steps; this IM is inadequate.</p> <p>SEE ALSO discussion of Impact 3.1-5, which cites this IM in mitigation of the GPU's Significant Unavoidable environmental impact, below.</p>	
<b>Goal 7</b>	<b>To protect historical/archeological sites located in the Foothill Area</b>		
		<p><b>The policies under this Goal misleadingly suggest that they have "modified" the existing FGMP policies when they have actually replaced them. 1981 Policy 7-1 and 7-2 required inventory and mapping of historical sites by experts in Tulare County history "for purposes of environmental impact review of foothill projects." The proposed revision inappropriately abdicates this responsibility to developers.</b></p> <p><b>By contrast, the required additional mitigating policies ERM-6.2, 6.3 and 6.6 provide specific instructions that the County shall protect cultural and archaeological resources, and permit development only after a site specific investigation has been conducted. The same level of</b></p>

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

	<b>protection should apply to Foothill sites. If ERM-6.2, 6.3 and 6.6 (as revised and with further revision to create effective Implementation Measures) are intended to apply to the FGMP, they should be cross-referenced to ensure application to development within the FGMP area.</b>		
FGMP-7.1	The County may require the developer to provide information at time of application submittal regarding any historical site and/or building that occupies the project area that is worthy of historical preservation.	IM- 22. The developer shall provide the appropriate fees for review of a project area by the California Archeological Inventory Information Center if the project site and affected areas are located in proximity to hilltops, buttes, watercourses, etc. which might have archaeological value. A more thorough on-site investigation by a qualified archeologist should be undertaken if deemed necessary by the District Archeologist.	Not a policy - improperly transfers responsibility for protecting historical sites to developer who has no basis for knowledge of historical sites or evaluating whether "worthy" of preservation and more critically, no interest in finding a historical site that may or will interfere with the developer's plans (and \$\$\$)
	<p><b>COMMENTS:</b> This Policy has been significantly revised from the current 1981 policy, which requires the County to obtain an inventory of historical sites and buildings worthy of protection from the Tulare County Historical Society. <b>Has such an inventory been compiled and kept up to date? If, 30 years later, the inventory has not been made, please explain why not.</b> How can the public rely on Implementation Measures propounded on paper by the County if they are not carried out?</p> <p>The RDEIR points out at page 3.12-10 that only qualified professionals can access the records maintained by the Information Center at California State University Bakersfield records associated with reported cultural resources surveys, including the records pertinent to sensitive sites. <b>How then is a developer going to be able to provide the information requested in this Policy and IM?</b></p> <p>The discretionary language of FGMP-7.1 ("County may") makes the provision of the specified information an option, not a requirement at all. The policy also inappropriately places the determination of whether a historical site or building exists or is "worthy of historical preservation" on the developer, whose interests will by definition be in conflict with either disclosing the existence of a possibly historic site or with a finding of historical worthiness. <b>The policy, as written, will not advance the goal of protecting historical or archeological sites.</b></p> <p>IM -22 is good start for protection of archeological sites, insofar as it defers evaluation of the site to a professional organization with appropriate expertise. However, FGMP-7.1 deals with all historic sites and buildings, not just archaeological sites. IM 22 therefore doesn't further the policy for other historic sites or buildings. In addition, IM.22 only applies to areas "located in proximity to hilltops, buttes, watercourses, etc." To be truly effective in protecting historic and archeological sites this limitation should be eliminated so that a proper evaluation is made no matter where the site is located. <b>Please revise.</b></p>

I19-176

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

Please confirm the identity of the California Archeological Inventory Information Center, as no organization of this name appears to exist.		
FGMP-7.2	<p>The County may require the developer to provide information at time of application submittal regarding possible archeological sites if a project is located in proximity to archeological sensitive areas such as hilltops, buttes, watercourses, etc.</p>	<p>IM-22. The developer shall provide the appropriate fees for review of a project area by the California Archeological Inventory Information Center if the project site and affected areas are located in proximity to hilltops, buttes, watercourses, etc. which might have archeological value. A more thorough on-site investigation by a qualified archeologist should be undertaken if deemed necessary by the District Archeologist.</p>
	<p><b>COMMENTS:</b> The policy inappropriately places the responsibility for identifying possible archeological sites on the developer, who is not qualified to make such determinations, and whose interests will by definition be in conflict with disclosing the existence of a possibly historic site. <b>The policy, as written, will not advance the goal of protecting historical or archeological sites.</b></p> <p>The current 1981 FGMP more appropriately places responsibility for identifying <i>and mapping</i> historic and archeologically important sites on the County with the assistance of the Tulare County Historical Society. <b>Please revise to return responsibility to an entity or entities which do not have an inherent conflict of interest, and to make the policy mandatory.</b></p> <p>The current Implementation Measure for this policy also asserts that "An archeological sensitivity map has been prepared for Tulare County by the Anthropology Department, California State University Fresno. This map is for general use to determine areas of the foothills that have the potential of encompassing archaeological sites. If a project is within a sensitive area, a more thorough on-site investigation by a qualified archaeologist should be undertaken." <b>Where is this map? Has it been updated since 1981? Why has it not been included in either the revised FGMP or the General Plan documents?</b></p> <p>The discretionary language of FGMP-7.2 ("County may") also makes the provision of the specified information an option, not a requirement. Again, the policy, as written, will not advance the goal of protecting historical or archeological sites.</p>	
FGMP-7.3	<p>The County shall protect significant historical or archeological sites, such as the one located on Rocky Hill, from development through maintenance of the site in open space. This policy shall not preclude development on adjacent property even though such property may be under</p>	<p><b>NO IMPLEMENTATION MEASURE</b></p>

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

	the same ownership as the site to be protected.	
	<p><b>COMMENTS:</b> In requiring protection of historical or archeological sites, Policy 7.3 is good. However, the new, added language permitting development on adjacent property, without an appropriate buffer zone, is likely to lead to the degradation or even loss of the site to be protected through any number of unavoidable environmental impacts. <b>The County should create and adopt a policy that requires a site that has been identified as worthy of protection to be evaluated by a qualified expert to determine what additional measures, including possible development restrictions on adjacent properties, may be required to fully protect the site. The tacked-on language permitting development on adjacent property should be deleted. What were you thinking??</b></p> <p>Because there is no Implementation Measure for this policy, the policy is unenforceable and mere wishful thinking. The Guidelines require at least one implementation measure for each policy. FGMP 7.3 fails to meet the minimum standard under the Guidelines.</p> <p>The current FGMP implements the original policy as follows: "The site plan review process will insure that significant historical and archaeological sites will remain protected through provision for open space easements on such sites."</p> <p>The lack of an Implementation Measure makes it impossible to evaluate the environmental impact the policy will have, good or bad, as required under CEQA. As a result, <b>any and all citations to this policy and/or IM in the RDEIR in mitigation of an environmental impact are baseless and unreliable.</b></p>	
<b>Goal 8</b>	<b>To protect the natural features of the foothills by directing development to selected areas.</b>	
FGMP-8.1	<p>The County shall discourage the location of development and improvements that are in close proximity to watercourse areas and riparian habitat, and prevent actual encroachment into those habitats.</p>	<p>IM-7. The Site Plan Review Committee shall review the consistency of the project with the location, type of design criteria of the County's policies for projects that only require Site Plan Review. Should the project not meet the County's policies, findings to that effect shall be forwarded to the appropriate decision-making body.</p> <p>IM- 23. The County shall ensure environmentally sensitive and riparian areas within development corridors are designated as open space on the FGMP reference maps.</p>
	<p><b>COMMENTS:</b> Watercourse and riparian areas are critical to the County's ability to recharge its water supply. Development, improvements and encroachments should be prohibited, not just discouraged. (Exceptions for minimal uses such as diversions for watering livestock may be specified.)</p>

I19-177 cont'd	I19-178	I19-179	I19-180	I19-181
<p>IM-7 see prior comments on IM-7 above. Note also that any Implementation Measure for this policy should specify the distance to be maintained from a riparian area – “close proximity” is a subjective measure.</p> <p>IM-23 applies only to environmentally sensitive areas “within development corridors”, thus leaving sensitive areas outside development corridors – to which Policy 8.1 apparently also applies – open to encroachment and destruction. IM-23 also does not ensure that development in identified and mapped areas will be prohibited, as it requires only that the area be designated on reference maps.</p>				
FGMP-8.2	<p>The County shall assure that drainage patterns of foothill developments are designed to prevent contamination and sedimentation due to soil erosion.</p>	<p>IM-29. The County shall require submission of a drainage plan with development projects in conjunction with the site plan review.</p>		
FGMP-8.3	<p>The County shall prohibit development of residences or permanent structures within the 100-year floodway.</p>	<p><b>NO IMPLEMENTATION MEASURE</b></p>		
		<p><b>COMMENTS:</b> Until an appropriate Implementation Measure is provided for this policy, it is unenforceable. The Guidelines require at least one implementation measure for each policy. FGMP 8.3 fails to meet the minimum standard under the Guidelines. The lack of an Implementation Measure also makes it impossible to evaluate the environmental impact the policy will have, good or bad, as required under CEQA. As a result, <b>any and all citations to this policy and/or IM in the RDEIR in mitigation of an environmental impact are baseless and unreliable.</b></p> <p><b>SEE ALSO discussion of Impact 3.4-3, which cites this policy and IM in support of the RDEIR's conclusion that policies in the GPU support the Attorney General's recommendations as set out in Table 3.4-5.</b></p>		
			<p>IM-31. The County shall ensure that unconventional disposal methods will be reviewed by the Tulare County Health and Human Services Agency to ensure that the standards of the Water Quality Control Board are met.</p>	
			<p>What is an “unconventional disposal method”? Would it be the same as an “innovative” method?</p>	
				<p>IM-30. The County shall require a properly designed wastewater disposal system to prevent surface or groundwater contamination and a drainage plan which minimizes sedimentation</p>

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

	whenever possible, conform to the natural contours of the existing foothill landscape.	<p>IM-14. The County shall promote the use of cluster development, greater setback distances, landscaping, and innovative lot design to protect scenic corridors within the County. Provisions for the use of these tools shall be incorporated into the County's land development ordinances.</p> <p>IM-25. The developer will be required to phase road construction to correspond with the phases of the development proposal.</p>	
	<p><b>COMMENTS:</b> This is a good policy, but it could be inconsistent with PF-2.7, which requires development within community UDBs to impose urban development standards, including minimum road widths. Please ensure that Foothill standards will supersede PF-2.7.</p> <p>The Implementation Measures for this policy are insufficient to implement the policy:</p> <p>IM-3 regulates only development on slopes greater than 15%, and then only requires a stabilization plan - which may mitigate but does not minimize cut and fill. IM-14 does not address road widths, minimized cut and fill or contour- conforming roads. See also comments regarding IM-14 above at FGMP 6.3, 6.4, 6.5. Please also explain in clear and explicit terms, how IM 14 will "promote" the use of cluster developments. Please also explain why IM 14, which is part of the Foothill Growth Management Plan, applies only to protecting designated scenic corridors, rather than the Foothill region generally. What analysis was done to determine that such limited scope was warranted? Please explain what the potential direct, indirect, and cumulative impacts of limiting the application of this IM to scenic corridors will be; 3) how the potential direct, indirect, and cumulative impacts have been or will be measured; 4) what baseline measures have been taken against which to measure the potential direct, indirect, and cumulative impacts of so limiting this provision; 5) how the County will mitigate the potential direct, indirect, and cumulative impacts resulting from the limited scope of this IM.</p> <p><b>SEE ALSO discussion of Impact 3.1-5, which cites this IM in mitigation of the GPU's Significant Unavoidable environmental impact, below.</b></p> <p>IM-25 addresses the timing of road construction, but doesn't address any of the issues raised in the policy.</p> <p>Please provide appropriate IM s.</p>		
FGMP-8.8	The County shall require erosion mitigation measures in new developments to prevent soil loss.	IM-3. The County shall require a grading and slope stabilization plan for that portion of the development exceeding slopes of greater than 15

		percent.	
	<b>COMMENTS:</b> IM-3 regulates only development on slopes greater than 15%. How will the County prevent soil loss from grading etc. on slopes 15% or less?		
FGMP-8.9	The County shall restrict the removal of natural vegetation, except for wildland fire prevention purposes.	<b>NO IMPLEMENTATION MEASURE</b>	
	<p><b>COMMENTS:</b> Policy 8.9 has a great deal of support, as Foothill residents highly value the natural vegetation – the oak woodlands and wildflowers are considerable tourist attractions. The policy should be expanded to expressly include native trees and brush.</p> <p>The County has been urged, and has said it intends to adopt an Oak Woodlands Ordinance that would protect native woodlands. It should have been included in this General Plan.</p> <p>Without an implementation measure, however, the policy is just wishful thinking. Please give this policy some teeth by providing a strong set of Implementation Measures.</p> <p>NOTE - THE RDEIR CITES IMS 15, 23 AND 25 IN CONNECTION WITH THIS POLICY. BECAUSE THESE IMs ARE NOT ASSOCIATED WITH THE POLICY IN THE REVISED FGMP, <b>THE DOCUMENTS ARE NOT CONSISTENT</b>. IN ADDITION, ONLY IM 23 IS EVEN REMOTELY RELEVANT TO THE POLICY.</p> <p>The Guidelines require at least one implementation measure for each policy. FGMP 8.9 fails to meet the minimum standard under the Guidelines. The lack of an Implementation Measure also makes it impossible to evaluate the environmental impact the policy will have, good or bad, as required under CEQA. As a result, <b>any and all citations to this policy and/or IM in the RDEIR in mitigation of an environmental impact are baseless and unreliable.</b></p> <p><b>SEE ALSO discussion of Impact 3.4-3, which cites this policy and IM in support of the RDEIR's conclusion that policies in the GPU support the Attorney General's recommendations as set out in Table 3.4-5.</b></p> <p><b>NOTE: FGMP Development Standards 20 and 21 provide that "Removal or grading around native trees (with a trunk of 6" or larger in diameter or [sic] 3' above ground surface) which may disturb the root system shall not be allowed during the construction process unless the Site Plan Review Committee deems it necessary because of road alignments or infrastructure improvements. Any trees to be removed shall be indicated on the submitted site plan." and "Removal of native trees in areas restricted to open space shall not be allowed unless the health, safety or welfare of residents associated with the development is endangered. Any trees proposed for removal must be indicated on the submitted site plan with accompanying information stating why the tree must be removed.</b></p>

	<p><b>NO IMPLEMENTATION MEASURE</b></p>		
FGMP-8.10	The County shall prohibit development that is considered to be geologically hazardous (slides, earthquake faults, etc.)	<p><b>COMMENTS:</b> This policy has nothing to do with the goal of protecting natural features. It should be associated with Goal 10.</p> <p>It appears that this Policy inadvertently omitted the words "in areas that are" following the word "development" and before the words "considered to be"; development itself cannot be geologically hazardous. Please correct.</p> <p>How will this policy be implemented without an implementation measure? The Guidelines require at least one implementation measure for each policy. FGMP 8.10 fails to meet the minimum standard under the Guidelines.</p> <p>The lack of an Implementation Measure also makes it impossible to evaluate the environmental impact the policy will have, good or bad, as required under CEQA. As a result, <b>any and all citations to this policy and/or IM in the RDEIR in mitigation of an environmental impact are baseless and unreliable.</b></p>	<p>IM-4. The County shall require information in the site plan review process to delineate slopes 30 percent or greater on the development site. Review of the proposal by the Committee will prescribe a project design that will maintain 30 percent slopes generally free of improvements, unless the problems associated with steep slopes are sufficiently mitigated.</p>
			<p><b>COMMENTS:</b> This revision of the FGMP has deleted the entire section in the 1981 FGMP that set out the Site Plan Review process as it applies to the FGMP; without this section, the Implementation Measures that rely on actions of the Site Plan Review process or the Site Plan Committee are meaningless.</p>
FGMP-8.12	The County shall prohibit unnecessary removal of native trees on development sites prior to approval	IM-7. The Site Plan Review Committee shall review the consistency of the project with the

	of development plans to control erosion, preserve wildlife habitat, and maintain the natural character of developing areas.	location, type of design criteria of the County's policies for projects that only require Site Plan Review. Should the project not meet the County's policies, findings to that effect shall be forwarded to the appropriate decision-making body.	
		<p><b>COMMENTS:</b> The policy is unnecessarily limited to removal of trees "prior to approval of development plans" and thus does not really protect native trees at all. Trees are routinely removed before permits are applied for even though this policy has been in effect since 1981. Since there is also no requirement that development plans not be approved if they require removal of native trees, or to require mitigation if trees must be removed, the policy is ineffective to protect trees as part of Site Plan Review.</p> <p>Current protocols do not require developers to indicate the location or size of existing trees on a site when plans are submitted, and there is no requirement that trees not be unnecessarily removed in connection with the development. (Or, if there are, they are not currently being followed.)</p> <p>See comment and proposed revision to IM-7 at FGMP 1.5, above. Because IM-7 does not implement any strategy to limit removal of native trees as part of site plan review, plans will simply continue to be approved with no consideration for preserving the trees.</p> <p>The County has said it supports and intends to adopt an ordinance to protect oak woodlands – this Policy should reference such an ordinance and be linked to it.</p> <p>In addition to being inappropriately limited in time, the policy is also flawed because it fails to specify how the "necessity" of removal will be determined. How will it be determined whether a removal is "unnecessary"?</p> <p><b>SEE ALSO comments regarding Impact 3.4-3 and Table 3.4-5, citing this Policy in support of the RDEIR's conclusion that policies of the GPU support the Attorney General's recommendations.</b></p>	
		<p><b>NOTE:</b> FGMP Development Standards 20 and 21 provide that "Removal or grading around native trees (with a trunk of 6" or larger in diameter or [sic] 3' above ground surface) which may disturb the root system shall not be allowed during the construction process unless the Site Plan Review Committee deems it necessary because of road alignments or infrastructure improvements. Any trees to be removed shall be indicated on the submitted site plan." and "Removal of native trees in areas restricted to open space shall not be allowed unless the health, safety or welfare of residents associated with the development is endangered. Any trees proposed for removal must be indicated on the submitted site plan with accompanying information stating why the tree must be removed.</p>	
		<p>This revision of the FGMP has entirely deleted current FGMP Policy 8/Flora &amp; Fauna - 2, which provides "Prevent encroachment of development onto riparian woodland habitats." 1981 FGMP at p. 18. The Implementation Measure that</p>

<p>currently carries out this policy by designating major riparian areas of each development corridor as open space (FGMP, p. 34) has also been lost. This policy is neither obsolete nor outdated. <b>Please explain 1) why these provisions have been deleted; 2) what the potential direct, indirect, and cumulative impacts of deleting these provisions will be on riparian woodland habitats; 3) how the potential direct, indirect, and cumulative impacts on the woodlands, waterways, and area wildlife have been or will be measured; 4) what new baseline data has been compiled on riparian woodland habitats; 5) how the County will mitigate the potential direct, indirect, and cumulative impacts on the woodlands, waterways, and area wildlife resulting from the deletion of these provisions. Please also provide the analysis and rationale underlying the decision to delete the provisions.</b></p> <p>Please reinstate the 1981 policy with appropriate Implementation Measures.</p> <p>The current IM for the policy states that “Level III designates the <i>major riparian areas of each development corridor as open space</i>.” Please also see comments at FGMP 8.14, which also apply here.</p>	<p>IM-26. The County shall review landscaping plans through the site plan review process to ensure that areas to be landscaped are compatible with surrounding native vegetation.</p> <p><b>COMMENTS:</b> How will the County “encourage” the use of compatible plants in landscaping? To truly achieve the goal, the County should either require or create incentives for compliance with policies.</p> <p>This revision of the FGMP has deleted the entire section in the 1981 FGMP that set out the Site Plan Review process as it applies to the FGMP; without this section, the Implementation Measures that rely on actions of the Site Plan Review process or the Site Plan Committee are meaningless.</p>	<p>To strengthen this policy – after reinstating the superior 1981 version – the County is encouraged to avoid use of terms with particular defined meanings (such as “special status species”) and use more generalized terms which will permit the County to make its own determination that a species is worthy of protection by the County whether or not it has been designated as sensitive, candidate or special</p>
<p>FGMP-8.13</p>	<p>The County shall encourage developers to use landscaping plant materials that are compatible with the surrounding native foothill vegetation.</p>	<p>Where special status species have been identified, the County shall protect their habitat against encroachment by development.</p> <p><b>NO IMPLEMENTATION MEASURE</b></p>
<p>FGMP-8.14</p>		

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

		under CEQA or federal law.
	<p><b>COMMENTS:</b> In what is beginning to look like an intentional policy of weakening protection for wildlife, its habitat, and the environment in general, the new, unimproved version of current Goal 8 Flora &amp; Fauna Policy 4, Revised Policy 8.14 has been entirely re-focused and eviscerated.</p> <p>The current policy clearly <u>directs the County to identify and protect rare and endangered species against encroachment by development</u>. As re-written, the County must protect only the habitat of "special status species" that have already been identified by some other, unnamed entity.</p> <p>The current IM for this policy (page 34) states that "Level II of the FGMP identifies wildlife habitats in each development corridor. Level III ... designates sensitive wildlife areas as open space in each development corridor." <b>Where has this information been incorporated into the RDGPU? Why is it not shown on any of the maps depicting development corridors in the FGMP area, or on a separate map of its own?</b></p> <p>Please explain 1) why this provision was deleted; 2) what the potential direct, indirect, and cumulative impacts of deleting this provision will be; 3) how the potential direct, indirect, and cumulative impacts have been or will be measured; 4) what baseline measures have been taken against which to measure the potential direct, indirect, and cumulative impacts of deleting this provision; 5) how the County will mitigate the potential direct, indirect, and cumulative impacts resulting from the deletion of this provision. Please also provide the analysis and rationale underlying the decision to delete this provision.</p> <p>By comparison with the Revised FGMP, which provides no Implementation Measure at all for this weakened policy, the current 1981 FGMP implements the policy via the FGMP tri-level analysis : Level II of the 1981 Plan identifies wildlife habitats in each development corridor, and Level III designates sensitive wildlife areas as open space in each development corridor.</p> <p>Please identify where in the Revised FGMP these habitats and designated open space wildlife areas are identified. If the Revised FGMP does not identify these habitats and open space wildlife areas, please explain 1) why this data and implementation measure were deleted; 2) what is the status of previously-designated open space under the revised FGMP; 3) what the potential direct, indirect, and cumulative impacts of deleting this data and implementation measures will be on the habitats and designated wildlife open spaces; 3) how the potential direct, indirect, and cumulative impacts have been or will be measured; 4) what baseline measures have been taken against which to measure the potential direct, indirect, and cumulative impacts of deleting these provisions; and 5) how the County will mitigate the potential direct, indirect, and cumulative impacts resulting from the deletion of this data and implementation measure.</p> <p>CEQA now affords equal protection to species and habitats that are considered sensitive, candidate or special status species. Accordingly, this policy should be expanded to reference all categories of protected species.</p> <p>Even this weak policy cannot be enforced without an Implementation Measure; the Guidelines require at least one implementation measure for each policy. FGMP 8.14 fails to meet the minimum standard under the Guidelines.</p>

	The lack of an Implementation Measure also makes it impossible to evaluate the environmental impact the policy will have, good or bad, as required under CEQA. As a result, <b>any and all citations to this policy and/or IM in the RDEIR in mitigation of an environmental impact are baseless and unreliable.</b>		
FGMP-8.15	The County shall restrict development in chaparral since these areas present extreme wildland fire potential.	<b>NO IMPLEMENTATION MEASURE</b>	
	<p><b>COMMENTS:</b> The Guidelines require at least one implementation measure for each policy. FGMP 8.15 fails to meet the minimum standard under the Guidelines.</p> <p>The lack of an Implementation Measure also makes it impossible to evaluate the environmental impact the policy will have, good or bad, as required under CEQA. As a result, <b>any and all citations to this policy and/or IM in the RDEIR in mitigation of an environmental impact are baseless and unreliable.</b></p> <p><b>SEE ALSO discussion of Impact 3.4-3, which cites this policy and IM in support of the RDEIR's conclusion that policies in the GPU support the Attorney General's recommendations as set out in Table 3.4-5.</b></p>		
FGMP-8.16	The County shall encourage the concentration of development along major travel routes to allow for future public transportation services and minimize travel distances to frequently used facilities.	<b>NO IMPLEMENTATION MEASURE</b>	.
	<p><b>COMMENTS:</b> Simply concentrating development along major travel routes without requiring new developments to also provide for demonstrably sufficient employment opportunities, service providers, and shopping venues within that development will not minimize travel distances, and may in fact encourage the creation of "bedroom communities" which will increase overall vehicle miles traveled.</p> <p>This policy has been in effect since 1981, yet extensive public transportation services that would minimize reliance on individual vehicles has yet to materialize. The RDEIR at 3.2-36 notes that transit service "is largely market driven" and will "expand as needed and will be self mitigating." The reasoning is backwards --the GPU is saying we will build in remote areas along highways so that sometime in the future, buses can reach the population that's already there, rather than developing where the transit already exists or can easily be expanded to cover the newly developed area.</p> <p>The Guidelines require at least one implementation measure for each policy. FGMP 8.16 fails to meet the minimum standard under the Guidelines. The lack of an Implementation Measure also makes it impossible to evaluate the environmental impact the policy will have, good or bad, as required under CEQA.</p>

	<p>As a result, any and all citations to this policy and/or IM in the RDEIR in mitigation of an environmental impact are baseless and unreliable.</p> <p>SEE ALSO discussion of Impact 3.4-1, which cites this policy and IM in support of the RDEIR's conclusion that the environmental impact is "Less Than Significant," and Impact 3.4-3, which cites this policy and IM in mitigation of the identified Significant and Unavoidable impact, below.</p>		
FGMP-8.17	<p>The County shall discourage the scattering of development throughout the foothills to reduce vehicular emissions by decreasing home to destination distances.</p>	<p>IM-1. The County shall concentrate rural and urban development in the development corridors delineated on a Master Development Plan.</p>	
	<p><b>COMMENTS:</b> A good policy, but weak – how will the County “discourage” scattered development throughout the foothills?</p> <p>IM-1 relies on concentrating development in the development corridors “delineated on a Master Development Plan”, but since Master Development Plans are required only for Planned Community Areas, which may be approved anywhere in the County – including outside designated development corridors – the IM makes the Policy meaningless. How will scattered development be prevented in areas that are within Foothill development corridors but that are not PCAs?</p> <p>The proposed policy to allow creation of PCAs in the foothills (and elsewhere) is inherently inconsistent with this long-standing policy of the FGMP.</p> <p>The policy and the IM also do not address the impact that the proposed PCAs – at least one of which has already been proposed for an area in the foothills outside any development corridor – will have on vehicle miles traveled.</p> <p>SEE ALSO discussion of Impact 3.4-1, which cites this policy and IM in support of the RDEIR's conclusion that the environmental impact is "Less Than Significant," and Impact 3.4-3, which cites this policy and IM in mitigation of the identified Significant and Unavoidable impact, below.</p>		
FGMP-8.18	<p>The County shall ensure that hilltop development is designed to preserve the skyline and maintain an unobstructed scenic panorama of the foothills for residents and visitors to enjoy.</p>	<p>IM-13. The County shall ensure that the design of subdivision is reviewed by the Site Plan Review Committee to assure the visual impact to the foothills is minimal.</p>	<p>PROPOSED REVISION: IM-13. The County shall prohibit hilltop development and hillside development that will interrupt the skyline. The Site Plan Review Committee shall develop and employ design standards and review procedures to assure there is no visual impact to the foothills by development.</p> <p>NOTE: Revised FGMP 8.18 is essentially the same as Revised FGMP 1.11; both cite as their source 1981 FGMP Goal 8, Policy 8-19, page</p>

			19. If the County intends to create duplicative policies, one for hillside development and another for hilltop development, they and their Implementation Measures should be as closely aligned as possible
		<p><b>COMMENTS:</b> To achieve the policy of preserving the skyline the policy should not be limited to hilltop development. No development that will interrupt the skyline should be permitted.</p> <p>IM-13 doesn't implement the policy because it will permit development that obstructs the skyline by permitting construction that the Site Plan Review Committee subjectively determines – without benefit of any guidelines – to be “minimal.”</p> <p>The policy should also not be limited to subdivisions: a single McMansion or collection of individually-built structures on a hilltop or situated on a hillside so that the skyline is broken will be just as detrimental.</p> <p>The IM doesn't provide a measurable means of attaining the policy. Please see proposed revision above.</p> <p>This revision of the FGMP has deleted the entire section in the 1981 FGMP that set out the Site Plan Review process as it applies to the FGMP; without this section, the Implementation Measures that rely on actions of the Site Plan Review process or the Site Plan Committee are meaningless.</p> <p><b>SEE ALSO discussion of Impacts 3.1-3, 3.1-4 and 3.1-5, which cite this IM in mitigation of the GPU's Significant Unavoidable environmental impact, below.</b></p>	
FGMP-8.19	<p>The County shall encourage maintenance and protection of unique open space areas such as riparian woodlands, oak groves, interesting rock formations, and scenic vistas.</p>	<p>IM-7. The Site Plan Review Committee shall review the consistency of the project with the location, type of design criteria of the County's policies for projects that only require Site Plan Review. Should the project not meet the County's policies, findings to that effect shall be forwarded to the appropriate decision-making body.</p>	<p>The County shall maintain and protect unique open space areas such as riparian woodlands, oak groves, interesting rock formations, and scenic vistas.</p>
		<p><b>COMMENTS:</b> This policy, which was previously Policy 2 under the 1981 FGMP Goal 8-9, p. 15, is basically a good one, despite the weak “encourage” language, but IM-7 does not explain how the policy will be realized..</p> <p>See also comment and proposed revision to IM-7 at FGMP 1.5, above. Also, this revision of the FGMP has deleted the entire section in the 1981 FGMP that set</p>

119-198 cont'd		119-199		119-200	
	treatment facilities to a responsible entity, which shall be established prior to approval of the final subdivision map.				
	<p><b>COMMENTS:</b> The policy is ambiguous, gives absolutely no guidance and is unenforceable – there is no standard set for the qualifications that must be met by an entity to which responsibility for water services will be delegated, or for what “a responsible entity” must be able to provide. The policy also applies only to new proposed subdivisions.</p> <p>The Guidelines require at least one implementation measure for each policy. FGMP 9.3 fails to meet the minimum standard under the Guidelines. The lack of an Implementation Measure also makes it impossible to evaluate the environmental impact the policy will have, good or bad, as required under CEQA. As a result, <b>any and all citations to this policy and/or IM in the RDEIR in mitigation of an environmental impact are baseless and unreliable.</b></p>				
FGMP-9.4	Based on existing soil conditions, types of land uses, effluent yield per land use, and the density of the proposed project, the County shall work with the Regional Water Quality Control Board and the Tulare County Health and Human Services Agency to review the adequacy of wastewater disposal areas.	IM-28. The County shall appoint a registered civil engineer or sanitarian along with a representative of the Tulare County Health Department to ensure that the magnitude of proposed projects do not exceed the physical holding capacity of the on-site soils to accept the estimated waste effluent.			
	<p><b>COMMENTS:</b> A more environmentally sound policy and IM would also take into consideration the impact the new development may have on other users (including wildlife) and cap development at a level below maximum actual holding capacity rather than simply assessing the holding capacity of the project site.</p>				
FGMP-9.5	The County may allow unconventional methods of disposing of sewage effluent, provided the system meets the performance standards of the Water Quality Control Board and the Tulare County Health and Human Services Agency. Such systems may include, but are not limited to common leach field, soil absorption mounds, aerobic septic tanks, or evapotranspiration systems.	IM-31. The County shall ensure that unconventional disposal methods will be reviewed by the Tulare County Health and Human Services Agency to ensure that the standards of the Water Quality Control Board are met.			
	<b>COMMENTS: At last.</b>

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

Goal 10	To accommodate development in the foothills that is serviceable by the various public agencies in a manner that does not become an economic burden on the County.		
FGMP-10.1	To provide for the integration of efficient road systems, existing community values, infrastructural improvements, and open space patterns, the County shall encourage development projects within a definable geographic area of a development corridor to comply with a common development or specific plan designed for that area.	<p>IM-16. The County shall explore the options for voluntary Williamson Contract cancellation on lands that are within a development corridor and under a Planned Development-Foothill Zone.</p> <p>IM-32. The County shall work with landowner and developers to promote coordinated master plans for multiple purposes.</p>	
	<p><b>COMMENTS:</b> IM-16 does not implement the policy it is also inconsistent with the Right to Farm policy fundamental to the County as well as with the oft-stated policy of protecting agriculture throughout the County and with the specific Goal of protecting agricultural uses in the Foothills (FGMP Goal 5). Productive agricultural uses on lands within a development corridor should be permitted to continue; it should be rezoned consistent with the common development or specific plan for that area when and if the land ceases to be in agricultural use.</p> <p>IM-32 is vague and ambiguous - what does this mean? what "multiple purposes" are intended? IM-32 provides no guidance to the public or to planners.</p> <p>The 1981 Implementation Measure on which IM-16 is based also called on the County to explore the legality of voluntary cancellations. <b>Has this been done? What result?</b> The implementation timeline for this IM shows "ongoing". Surely by now the County has explored this option!</p>		
FGMP-10.2	The County shall ensure that development is located in areas of the foothills that can be adequately served by existing Tulare County fire stations and the Sheriff's Department unless new facilities are proposed or required for the development.	NO IMPLEMENTATION MEASURE	
	<p><b>COMMENTS:</b> This policy has been revised (without disclosure) from the 1981 policy on which it is based: the current policy prohibits development in areas that cannot be serviced by existing County fire stations and Sheriff's Department facilities within a 15-minute "attack time." (See also "The Corridor Areas The First Level (2) at page 3-2, above). The modification to permit development if new facilities "are proposed or required" without also requiring those proposed or required facilities to be provided and financed by the developer puts the public at risk (because adequate services</p>

<p>may not be available or provided) and puts a financial burden on the County. The current FGMP requires property that falls outside the 15-minute "attack time" to be designated as <b>open space or agricultural land</b>. Please revise to return the current limitations on development in these areas.</p> <p>The Guidelines require at least one implementation measure for each policy. FGMP 10.2 fails to meet the minimum standard under the Guidelines. The lack of an Implementation Measure also makes it impossible to evaluate the environmental impact the policy will have, good or bad, as required under CEQA. As a result, <b>any and all citations to this policy and/or IM in the RDEIR in mitigation of an environmental impact are baseless and unreliable.</b></p>	<p><b>NO IMPLEMENTATION MEASURE</b></p>	<p><b>COMMENTS:</b> FGMP 10.3 is vague - what does "fire and crime protection plan considerations" mean? What does it mean to say that such considerations must be incorporated into proposed developments? If the intent of this policy is to require developers to provide for, and establish the ability to finance ongoing operations of, fire and crime protection services, the policy should clearly state that as a requirement.</p> <p>The policy cannot be enforced without an implementation measure. The Guidelines require at least one implementation measure for each policy. FGMP 10.3 fails to meet the minimum standard under the Guidelines. The lack of an Implementation Measure also makes it impossible to evaluate the environmental impact the policy will have, good or bad, as required under CEQA. As a result, <b>any and all citations to this policy and/or IM in the RDEIR in mitigation of an environmental impact are baseless and unreliable.</b></p>
<p>FGMP-10.3</p>	<p>The County shall require that fire and crime protection plan considerations, including financing, be incorporated into all proposed developments to ensure adequate emergency services are available and able to serve new development.</p>	<p>Where a specific plan is to be prepared for a sub-area of a development corridor, the County shall require a financing plan for the installation, operation, and ongoing maintenance of infrastructure resources to support growth in the specific plan area.</p>
<p>FGMP-10.4</p>	<p>IM-33. The Planning Commission and the Board of Supervisors shall consider the financing plan during their review and consideration of the specific plan, Master Development Plan, or Area Development Plan. The financing plan shall be used as a basis for establishing programs and standards within the specific plan, Master Development Plan, or Area Development Plan which mitigate or avoid the adverse fiscal impact of development upon local public service agencies and County agencies.</p>	<p>The Planning Commission and the Board of Supervisors shall use the financing plan supplied by the proponent of any specific plan, Master Development Plan, or Area Development Plan as the basis for programs and standards to apply within the specific plan. The financing plan demonstrate substantial mitigation or avoidance of any adverse fiscal impact of development upon local public service agencies and County agencies.</p>

**COMMENTS:** This modified policy is not implemented by IM-33. See proposed revision above.

### FGMP DEVELOPMENT STANDARDS

The RDEIR states that it has "restored" a "comprehensive list of FGMP development standards." RDEIR at 2-13. But while many of the 1981 standards have been included in the Revised FGMP, a number have been modified, without disclosing that changes have been made. The standards have also now been prefaced with a disclaimer. Adherence to the FGMP standards is now no longer mandatory because a developer may "demonstrate" that "an alternative standard will result in attainment of a superior environment." The standard against which the proposed superior environment will be measured is unspecified, and apparently left to the subjective judgment of the County. This is unacceptable. The public is entitled to know what standards must be met by new development that will affect current residents as well as new ones. If adherence to published standards is discretionary, the public is left un-advised and neither the public nor planners have been given any guidance. A developer is free to exceed the established standards, but must adhere to the FGMP Development Standards at a minimum.

And while most of the 1981 standards have in fact been incorporated into the Revised FGMP, the County has missed an opportunity to update and strengthen the standards to support and enhance today's environmental concerns. For instance, Standard 25 permits waiver of minimum lot width and setback requirements for properties along a scenic highway "if it is deemed appropriate because of existing development patterns." Under this language, an entire scenic corridor could be lost to incremental development creep – one or two encroaching structures may be cited to justify another. Then there are three, five, ten....

Another example: Development Standard 27 exempts "newly created parcels that are 10 acres or larger" from the requirement that each residential or planned unit development in a development corridor join or form an association or community organization or mutual water company to monitor and maintain the water system. Why should development on parcels larger than 10 acres be exempt from this requirement, when large-scale developments are likely to use more water, and thus should be even more aware of their water usage?

More importantly, the County could – and should – have taken this opportunity to specifically incorporate provisions to

Bodner/Olecki Comments on  
Recirculated RDEIR and General Plan 2030 Update  
May 27, 2010

ensure that new development within the FGMP area incorporate energy-efficient “smart growth” standards (i.e., LEED-ND), and “dark sky” provisions to protect the County’s outstanding nightscape from light pollution.	I19-208 cont’d
An Implementation Measure in the 1981 FGMP required the County to “Adopt by Ordinance the Foothill Development Standards which are now included as a subsection of the Foothill Growth Management Plan.” <b>Please indicate when this Ordinance was adopted and provide a citation for it. Why isn’t it referenced in the GPU?</b>	I19-209
Other changes:	I19-210
Development Standard 5 appears to have deleted the word “open” before the word “space” in the last line, which changes the meaning of the standard: there is no designation of “common space.” Please correct by reinstating the word “open”.	
Development Standard 8 (graded slopes shall be planted with native plant materials wherever possible) appears to conflict with Standard 17 (Exposed slopes shall be planted with native plant materials or similar climactically adapted vegetation. . . .).	I19-211
Development Standard 32 has added a requirement that residential subdivision or planned unit developments provide a financing and maintenance mechanism acceptable to the County for street maintenance and replacement, but no guidelines or specific standards are provided.	I19-212

RE: General Plan 2030 Update and Draft Environmental Impact Report (SCH No. 2006041162)

Dear Mr. Bryant:

This letter supplements our separately-submitted comments on the Recirculated Draft EIR ("the RDEIR") and the Recirculated General Plan 2030 Update ("the GPU"). | I19-214

In our review of the GPU and the RDEIR we identified a number of policies that cannot be implemented because they lack any Implementation Measures. In addition to those identified in the body of our more detailed comment letter, please be advised that there are no Implementation Measures for the following policies: | I19-215

LU 3.1	LU 3.7	LU 7.1 – 7.4
LU 3.3	LU 4.2 – 4.6	LU 7.6 – LU 7.11
LU 3.4	LU 5.3	LU 7.14
LU 3.5	LU 5.5 – 5.7	LU 7.17
LU 3.6	LU 6.1 & LU 6.2	

Sincerely,

Karen Bodner

To Whom it May Concern:

Re: Tulare County General Plan Update 2030 and Recirculated DEIR

The alternatives explored in the RDEIR, while giving a nod to many smart growth principles, all ignore fundamental policies and strategies that must be adopted in order for Tulare County to grow in a smart, sustainable manner.

I20-1

None of the alternatives adequately address the concerns voiced by the people in the General Plan workshops. These concerns included air quality, water quality and availability, the preservation of agricultural lands, and the expansion of the economic base for the Central Valley.

While both the City Centered Alternative and the Confined Growth Alternative are marginally preferable to the proposed project, *all* of the proposed alternatives are subject to the ambiguous policies and weak implementation measures contained within the GPU, rendering the idea of alternatives moot. None of the alternatives will ensure efficient, sustainable growth and none adequately incorporate the suggestions of the healthy growth alternative suggested by TCCRG and supported by a number of other organizations and individuals.

The RDEIR states that, “the purpose of the alternatives analysis in an EIR is to describe a range of reasonable alternatives to the project...” While the RDEIR Alternatives Section includes, on its face, many good ideas and strategies, it fails in its stated purpose of providing a “range of reasonable alternatives.” While several of the “*additional strategies that **could** be integrated into the policies and implementation measures of the Goals and Policies Report...*” - particularly those listed in the City Centered and Confined Growth alternatives - are wise and inclusive of smart-growth principles, the use of the word “could” renders these additional policies impotent. Furthermore, should the Board select an Alternative, the on-the-ground effect would be virtually meaningless as this alternative would be subject to the irresolute should, could, will-form-a-committee-to-discuss language of the both the previous and current versions of the GPU.

I20-2

Like the DEIR Alternatives, the RDEIR Alternatives differ only slightly in their proposed population distributions. For example, regardless of which alternative is selected, 26-32% of the growth in the next 20 years will occur in Tulare County's unincorporated areas. Consequently, these alternatives propose nearly identical outcomes in terms of our future population distribution. No alternative is provided that would, for example, direct 90% or more of future growth to already urbanized areas, **require** resource-efficient development and **strictly** limit the circumstances under which development boundaries could be modified.

I20-3

The County's reasons for selecting the proposed project are also lacking. It is suggested that the "environmentally superior" Confined Growth Alternative is dismissed because of its failure to "provide opportunities for small unincorporated communities to grow and improve quality of life and their economic viability." However, the difference in population distribution between the Confined Growth alternative and that of the proposed project is approximately 30,000 people. Given the fact that Tulare County has 20 communities and 11 hamlets, this diffusion of individuals to the rural and agricultural portions of our County is less likely to boost the economic prospects of our smaller communities and more likely to exacerbate the air pollution, water scarcity, and rapid loss of productive agricultural lands. Most of Tulare County's hamlets and many of her communities lack safe drinking water, proper wastewater treatment, and adequate infrastructure. Rather than directing our growing population to areas that have the resources, the capacity and the willingness to accept it, the GPU will simply contribute to the unplanned, inefficient sprawl that has made this County one of the most polluted areas in the nation.

I20-4

The RDEIR must once-again be meaningfully revised to present a truly reasonable range of alternatives, including at least once alternative that **clearly** and **firmly** directs growth into those urbanized areas that have the desire and the capacity to accommodate that growth.

I20-5

I urge the County to revise Alternative 5 (Confined Growth) to truly direct growth into our existing urbanized areas, protect agriculture and open space through efficient development, allows no leapfrog development of new towns and growth corridors, and provide only very limited circumstances under which urban development boundaries may be expanded. This loophole-free "Healthy Growth Alternative" should include clear, firm policies that support the following:

- Base the location, density, and amount of growth within urbanized areas on their desire and capacity to accommodate growth.
- Locate development (except that which is directly related to agriculture) within existing Development Boundaries, without loopholes or exceptions that allow for leapfrog new town or growth corridor development.
- Require (or incentivize) efficient development within or contiguous to existing urbanized areas.
- Make community and hamlet development boundaries meaningful, long-term planning boundaries by firmly limiting the circumstances under which they can be expanded.
- Discourage the premature conversion of agricultural lands to urban uses, and offset unavoidable impacts to agricultural lands and natural resource areas with mandatory mitigation measures such as conservation and agricultural easements.

Provide strong, clear policies with concrete, enforceable implementation measures that include definite timeframes, funding sources, and departments in charge of monitoring and enforcement.

Finally, I understand the dire financial situation that Tulare County is in, and I understand that these are tough economic times at every level from the individual tax

I20-6

payer to the highest levels of government. Given these circumstances, however, I find it baffling and unconscionable that the County has wasted years and millions of dollars developing TWO General Plans that are essentially worthless in the face of clear direction by Tulare County residents, hundreds of pages of comments by concerned citizens and organizations, and clear directives from the Attorney General.

I20-6  
cont'd

I ask that the GPU and RDEIR be further revised to provide clear, meaningful policies and implementation measures and truly “reasonable range” of Alternatives, including one inclusive of the smart growth principles suggested by TCCRG and their proposed Healthy Growth Alternative.

I20-7

Thank you for the opportunity to comment.

Sincerely,

**Re: Tulare County Revised Draft General Plan 2030 Update and  
Recirculated Draft Environmental Impact Report For Tulare  
County General Plan**

Dear Mr. Bryant:

On behalf of the Tulare County Council of Cities,<sup>1</sup> the law firm of Shute, Mihaly & Weinberger LLP submits the following comments on the Tulare County Revised Draft General Plan 2030 Update ("General Plan" or "Project") and the Recirculated Draft Environmental Impact Report prepared for the General Plan ("RDEIR"). Based on our review of these documents, we conclude that, in their current form, both the General Plan and RDEIR violate state laws critical to sound land use planning.

I21-1

Despite the passage of two years and multiple meetings between representatives of Tulare County and the Cities, the proposed General Plan and accompanying RDEIR show little—if any—improvement over the versions circulated by the County in 2008. While this most recent version of the General Plan, like its predecessor, claims to promote city-centered growth, it does not. If one attempts to piece together the land uses allowed in the General Plan, including those from the more than 80

I21-2

<sup>1</sup> The Council of Cities consists of the cities of Dinuba, Exeter, Farmersville, Porterville, Tulare, Visalia, and Woodlake (collectively referred to herein as "the Cities").

David Bryant, Project Planner  
May 26, 2010  
Page 2

individual plans that are incorporated into the General Plan, the image that emerges of the County's vision for growth is far from "city-centered." To the contrary, the General Plan allows urban development throughout much of the County, in "hamlets" and "planned communities," as well as in unspecified "corridor plans" and "new towns."

I21-2  
cont'd

The widespread urbanization contemplated by the General Plan threatens to consume tens if not hundreds of thousands of acres of agricultural lands, the very lands that are necessary for the County's most important industry: farming. The haphazard development resulting from the proposed Plan will also have admittedly significant impacts on the County's air and water quality, water supply, transportation and circulation, among other resources. Rather than propose measures or policies to reduce these growth-related impacts, however, the County appears resigned to their inevitability, deeming twenty-three of the General Plan's impacts significant and unavoidable. In doing so, the County is missing a critical opportunity for responsible planning and growth that achieves the goals of AB 32 and SB 375 and avoids long-term environmental damage.

I21-3

But perhaps most disappointing to the Council of Cities is the Plan's complete failure to meet one of its key objectives – to "[e]nhance planning coordination and cooperation with the agencies and organizations with land management responsibilities in and adjacent to Tulare County." General Plan at A-2 (Principle 6: Planning Coordination and Cooperation). Representatives of the Cities met repeatedly with County representatives over the past two years to discuss policy changes that could further this goal. Yet, the proposed General Plan does not reflect the Cities' suggested changes. Instead, it simply states that the County "may" work with the Cities when approving development within the Cities' planning boundaries.

I21-4

Given the County's incoherent land use plans for the Cities' planning boundaries and the County's poor track record permitting urban development, this policy provides the Cities little comfort. True city-centered growth means growth within city limits that is coordinated with annexation. The County's General Plan merely gives lip service to city-centered growth: it fails to include the policies and framework necessary to ensure such growth occurs when the Cities are ready to annex so development is consistent with Cities' land use plans and standards for development.

I21-5

Adoption of the General Plan and certification of the RDEIR, however, would not just constitute bad planning, it would violate state law. Our review of the General Plan and RDEIR reveals serious violations of the California Planning and Zoning Law (Government Code section 65000 *et seq.*), California Environmental Quality Act ("CEQA") (Public Resources Code section 21000 *et seq.*) and CEQA Guidelines

I21-6

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 3

(California Code of Regulations, title 14 section 15000 *et seq.*), and the Regional Welfare Doctrine. For example, contrary to the requirements of the Planning and Zoning Law, the General Plan's Land Use Element is missing key information about what development can go where and at what densities. The policies and land use designations it does contain frequently conflict. In fact, the Land Use Element is so convoluted and difficult to navigate that it cannot serve as an effective guide to future growth in the County.

I21-6  
cont'd

The RDEIR proves equally inadequate. Reflecting the incomprehensible nature of the Land Use Element, the Project Description fails to describe the types and intensity of uses that could be developed within each of the proposed planning areas in the County. Instead, each discussion of the Project's environmental impacts relies on a different Project description; none, however, analyzes the impacts of the growth allowed under the General Plan.

I21-7

While the RDEIR's impacts analyses identify numerous significant impacts associated with the General Plan's projected growth, the RDEIR fails to identify effective mitigation measures or alternatives that could reduce these impacts, even though changes to the General Plan's policies could feasibly accomplish this goal. In addition, the RDEIR's discussion of the Project's agricultural, land use, transportation, air quality, climate change, water supply, public services, biological resources, and cumulative impacts all fail to provide the type and detail of analysis that CEQA requires.

I21-8

Finally, approval of the proposed General Plan would be an unlawful exercise of the County's police power, as it does not adequately take into consideration the welfare of the region. The County must revise and recirculate the General Plan and RDEIR once again.

I21-9

# **I. The General Plan Violates California Planning and Zoning Law.**

A general plan is an essential aspect of the governance of any county, a "constitution for all future development." *Leshner Communications, Inc. v. City of Walnut Creek* (1990) 52 Cal.3d 531, 540. A general plan shows County residents, landowners, and decisionmakers what type of development is appropriate where, and what areas must be preserved for open space, agricultural, and other non-urban uses. It also contains policies that guide growth by facilitating or encouraging development in some areas and restricting it in others. Moreover, a general plan provides a format for thinking globally about the impacts and needs of development (such as infrastructure and water supply), and for planning ahead to meet those needs.

I21-10

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 4

The County's proposed General Plan, however, serves none of these purposes. Rather than putting forth a comprehensive, effective general plan, the proposed General Plan simply assumes that unfettered urbanization is inevitable. Instead of providing clear guidance to the public and decisionmakers about what can be developed where, the proposed General Plan requires its readers to wade through nearly a hundred separate plans to piece together a picture of the County's vision for development over the next twenty years. Moreover, its purported goal of achieving city-centered growth is fundamentally inconsistent with its policies, which allow urban uses throughout the County. In short, the proposed General Plan is entirely inadequate.

I21-10  
cont'd

**A. The General Plan Does Not Contain a Valid Land Use Element.**

I21-11

At the heart of any general plan is the land use element—the most fundamental of the mandatory elements of a general plan. *See* Gov. Code § 65302(a); Governor's Office of Planning and Research ("OPR"), "General Plan Guidelines" (2003) at 49 (land use element "plays a central role in correlating all land use issues into a set of coherent development policies"). The land use element must "designate[] the proposed general distribution and general location and extent of the uses of the land for housing, business, industry, . . . agriculture, . . . and other categories of public and private uses of land." Gov. Code § 65302(a). A plan's depiction of its policies "should be detailed enough to identify possible uses at any particular time." 67 Ops. Cal. Atty. Gen. 75 (Mar. 7, 1984). State law, moreover, requires that a general plan contain "a diagram or diagrams and text setting forth objectives, principles, standards, and plan proposals." Gov. Code § 65302.

The proposed General Plan fails to comply with these requirements for at least two reasons. First, the Land Use Element is so convoluted and confusing that it simply cannot serve as the blueprint for growth that it is intended to be. Second, even if one could piece together the myriad individual plans comprising the "Land Use Element," the General Plan is missing critical land use designations, population densities and building intensities for various areas of the County.

**1. The Land Use Element Is Incomprehensible.**

I21-12

Pursuant to state law, an adequate general plan must be "reasonably consistent and integrated on its face." *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal. App. 3d 692,744. Its organization must be logical, and its standards and policies for future development must be stated with reasonable clarity. *Id.* Put simply, a general plan cannot serve as the "constitution for all future developments" if no-one can tell what development it allows where. *See Concerned Citizens of Calaveras County v.*

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 5

*Board of Supervisor* (1985) 166 Cal. App. 3d 90, 97 (general plan must “state with reasonable clarity what its plan is”); *Kings County*, 221 Cal. App. 3d at 744 (“A general plan which does not set forth the required elements in an understandable manner cannot be deemed to be in substantial compliance” with the Planning and Zoning Law).

I21-12  
cont'd

Unfortunately, the proposed General Plan Land Use Element is so convoluted that it cannot serve as an adequate guide for development within the County. While this iteration of the Land Use Element, unlike its 2008 predecessor, contains a “Land Use Diagram,” (General Plan, Figure 2-2), that diagram does not contain land use designations for every area of the County. Instead, it contains designations for a handful of areas and then refers the reader to more than eighty—eighty!—additional plans to figure out the designations for the rest of the County. These additional plans include:

- 3 “Area Plans”
  - Rural Valley Lands Plan
  - Foothill Growth Management Plan
  - Mountain Framework Plan
- 10 “Sub-Area Plans”
  - Great Western Divide North Half Plan
  - Juvenile Detention Facility—Sequoia Field Land Use and Public Buildings Elements
  - Kennedy Meadows Plan
  - King Rivers Plan
  - Sequoia Field Land Use and Public Buildings Elements
  - Great Western Divide South Half Plan
  - Posey Plan
  - Redwood Mountain Plan
  - South Sierra Plan
  - Upper Balch Park Plan
- 10 “County Adopted City General Plans” (“CACGPs”)
  - Dinuba
  - Exeter
  - Farmersville
  - Lindsay
  - Porterville
  - Tulare
  - Visalia
  - Woodlake
  - Delano

- Undetermined number of “Corridor Plans”

See General Plan at I-1-2 through I-1-7.

Making matters worse, many of these “plans” consist of multiple documents reflecting various changes to the County’s land use policies over the years. For example, the CACGP for Visalia is made up of 17 separate documents, each of which contains a piecemeal amendment to some prior version of the County’s land use plan for the area within Visalia’s UDB. It is impossible to tell from this hodge-podge of documents whether there are land use designations for all of the parcels within this planning area, much less what is permitted on any given parcel. It is not even clear whether the “original” land use plan—to which all these amendments ostensibly apply—is part of the Visalia CACGP.

I21-13

In addition, a significant percentage of the plans referenced in the Land Use Diagram have yet to be developed or adopted. Specifically, the County must still prepare five of the “Sub-Area Plans,” two of the “CACGPs,” eight of the “Community Plans,” and all eleven of the “Hamlet Plans.” See General Plan Goals and Policies Report at I-1-5 through I-1-7. In the meantime, the County has simply designated these areas for “mixed use”—less of a planning designation than a plan-free designation. The Corridor Plans are even more problematic: not only have they not been developed, their boundaries have not even been established. Thus, the areas covered by the Corridor Plans are like a development wildcard, allowing the County to approve commercial, industrial and mixed use development along transportation routes throughout the County. See General Plan at II-2-1; General Plan, Policy C-1.6 (Regional Growth Corridor Opportunity Areas – Interim Policy at Area Policies II-2-2). And because the General

I21-14

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 8

Plan places no time limit on when Corridor Plans must be adopted, the development allowed under the interim policy could occur indefinitely.

I21-14  
cont'd

In *Camp v. Board of Supervisors of Mendocino County*, the court criticized a general plan that consisted of “a sheaf of uncoordinated documents stuffed into an unlabelled carton.” 123 Cal. App. 3d at 349, fn. 8. As the *Camp* court noted, a general plan that is thrown together in this way “make[s] resort to it for planning information an awkward exercise” and “generate[s] doubt concerning the integrity of the plan.” *Id.* The County’s proposed General Plan is little more than a virtual box of documents, scanned and posted on the County’s website.<sup>2</sup> As such, it is inadequate under state Planning and Zoning Law.

I21-15

**2. The Land Use Element Lacks Land Use Designations and Building Intensities for Various Areas Throughout the County.**

I21-16

Even if these 80 individual plans could be cobbled together to form a coherent whole, the Land Use Element would still be inadequate because it fails to provide land use designations and building intensities for all areas of the County. As discussed above, the Land Use Element must “designate[] the proposed general distribution and general location and extent of the uses of the land for housing, business, industry, . . . agriculture, . . . and other categories of public and private uses of land.” Gov. Code § 65302(a). Moreover, the Land use element must contain information regarding the standards for population density and building intensity for the various districts and other territory covered by the plan. *Id.*; see also *Twain Harte Homeowners Association v. Tuolumne County* (1982) 138 Cal. App. 3d 664, 699. These standards establish the holding capacity of the area and serve as a blueprint for all future development in the plan area. See *Koster v. County of San Joaquin* (0996) 47 Cal. App. 4th 29, 41-42.

---

<sup>2</sup> While the County did make these documents available online, the website itself was extremely cumbersome to navigate. Many of the documents (large PDFs of old documents) took several minutes each just to open. Attempts to expand one folder (for example, the folder containing the CACGP for Visalia) often resulted in the collapse of its parent folder (“Part II County Adopted City Plans 4 of 5”). As a result, the County made the already onerous process of piecing together these multitudinous plans even more difficult and frustrating.

I21-17

David Bryant, Project Planner  
May 26, 2010  
Page 9

Given the fractured nature of the adopted CACGPs, it is not clear that the County has adopted land use designations for all of the areas within these planning boundaries. Even where the Land Use Element identifies designated land uses, many planning areas still lack the required building intensity standards. For example, the Pixley Community Plan does not identify land use intensity standards for the following land use designations: Residential Reserve; Commercial; Commercial Reserve; Industrial; Industrial Reserve; Planned Industrial; and Public/Quasi-Public. *See* Pixley Community Plan (GPA 92-06), December 9, 1997 at 4-22, 4-23. Similarly, the Foothill Growth Management Plan ("FGMP"), which covers the County's foothills generally above the 600 foot elevation contour, contains a "Foothill Mixed Use" land use designation. *See* General Plan II-3-1. The General Plan provides no intensity standards for this land use designation; instead it directs the reader to the FGMP itself. *See* General Plan Table 4.1, footnote 7. Yet the FGMP does not actually identify building intensity standards for non-residential uses (i.e., commercial, industrial, public uses).

I21-16  
cont'd

In other areas of the County, the proposed Land Use Element simply abdicates the responsibility for planning altogether, slapping a generic "mixed use" designation on entire communities. For example, in the eight unincorporated communities that have no adopted Community Plans, the County provides virtually no guidance or direction for growth. Until such time as a community plan is adopted for those communities without existing plans, the County's proposed General Plan establishes a "Mixed Use" land use designation, pursuant to policy PF 2.6: Land Use Consistency. General Plan Goals and Policies Report at I-2-4 and RDEIR at 2-26. Inasmuch as the "Mixed Use" designation would allow a wide range of residential densities (1-30 units per acre), as well as commercial uses and public facilities, the County is essentially establishing a free-for-all for land owners in the communities of Alpaugh, East Orosi, Lemon Cove, London, Plainview, Tipton and Woodville. *Id.* "Mixed use" is also the land use designation for large swaths of land within the Foothill Growth Management Plan. *See* General Plan, Figure 2-2.

I21-18

The Land Use Element fares no better in its approach to Corridor Plans. "Corridors" occur adjacent to the transportation routes in the County. *See* General Plan at II-2-1. The County proposes to allow commercial, industrial and mixed use development along transportation routes *prior to* the adoption of the Corridor Plans. *See* General Plan, Policy C-1.6 (Regional Growth Corridor Opportunity Areas – Interim Policy at Area Policies II-2-2). Thus again, the General Plan fails to provide the necessary guidance as to the location, type and intensity of mixed use development that would be allowed along these corridors. Specifically, while the General Plan shows the locations of the roadways themselves (Part II, Figure 2-1), the document does not identify

I21-19

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 10

where along the roadways development would occur. In addition, because the General Plan contains no building intensity standards for these Corridor Plan locations, it would appear that any type of project at any particular intensity could be developed along every major roadway (including scenic roadways) throughout the County. | I21-19  
cont'd

In sum, the County's piecemeal approach to updating its Land Use Element is a dismal failure. Rather than setting forth a well integrated, compatible set of plans that would provide land use direction for unincorporated County lands, the profusion of plans comprising the County's proposed Land Use Element fails to provide the legally required land use designations and direction needed for decisionmakers, public entities, property owners and County residents to know what type and intensity of development can go where. | I21-20

**B. The Circulation Element Is Legally Inadequate, and the Land Use and Circulation Elements Are Not Correlated With One Another.** | I21-21

Government Code § 65302(b)(1) requires that a circulation element consist of the general location and extent of existing and proposed major thoroughfares, transportation routes, terminals, and military airports and ports, and other local public utilities and facilities, all correlated with the land use element of the plan. The draft General Plan's Circulation Element does not comply with State Planning and Zoning Law for two reasons: (1) it does not set forth the location of proposed major thoroughfares and (2) it is not correlated with the Land Use Element. |

The proposed General Plan's Circulation Element contains one map that merely shows the County's existing road system. See Figure 13-1: Tulare County Road System. The Element does not describe either graphically or in text any proposed major thoroughfares or any planned roadway improvements. While the RDEIR does identify various roadway projects that may be implemented by 2030, as discussed below in section II.B.3, it is entirely unclear which, if any, of the proposed roadway improvements are part of the Circulation Element. The General Plan Update thus does not meet the requirements of the Planning and Zoning Law. | I21-22

As discussed above, state law requires that a general plan's circulation element be "correlated"—that is, "closely, systematically, and reciprocally related"—to the land use element of the plan. Gov. Code § 65302 (b); *Concerned Citizens of Calaveras County v. Board of Supervisors* (1985) 166 Cal. App. 3d 90, 99-100. In practical terms, the correlation requirement "is designed to insure that the circulation element will describe, discuss and set forth 'standards' and 'proposals' respecting any | I21-23

May 26, 2010  
Page 11

change in demands on the various roadways or transportation facilities of a county as a result of changes in uses of land contemplated by the plan.” *Id.* at 100.

I21-23  
cont'd

As the RDEIR recognizes, “transportation and circulation needs are closely tied to the location and distribution of land uses.” RDEIR at 3.2-21. Here, the County has not completed the required planning work to properly correlate the Land Use Element with the Circulation Element. If the County does not know where specifically growth will occur or the intensity of this growth, how could it possibly know how many roads and intersections it will need to accommodate this development? The RDEIR already acknowledges that the proposed General Plan will result in unacceptable levels of service along several roadways. It is thus abundantly clear that the Circulation Element does not accommodate the level of growth contemplated in the Land Use Element. Finally, inasmuch as the Circulation Element makes no mention of planned roadway improvements, the document lacks any evidentiary basis that it has taken the County’s growth projections into account.

**C. The General Plan Is Internally Inconsistent.**

I21-24

A fundamental tenet of state Planning and Zoning Law is that a general plan must be internally or “horizontally” consistent: that is, its elements must “comprise an integrated, internally consistent and compatible statement of policies for the adopting agency.” Gov. Code § 65300.5; *Sierra Club v. Kern County Board of Supervisors* (1981) 126 Cal. App. 3d 698, 704. General plan consistency is “the linchpin of California’s land use and development laws; it is the principle which infused the concept of planned growth with the force of law.” *deBottari v. Norco City Council* (1985) 171 Cal. App. 3d 1204, 1213. Because the County’s proposed General Plan is internally inconsistent, it violates state Planning and Zoning Law.

The most fundamental internal inconsistency in the General Plan arises from the conflict between its “city-centered growth” policies and the policies that encourage sprawl. The General Plan calls for supporting “smart growth” and “healthy communities” by discouraging sprawl and incorporating other policies for sustainability. *See, e.g.*, General Plan Policy LU1.1 at I-4-22; General Plan Goals and Policies Report at A-2. Principle 4 also states that rural residential sprawl should be avoided. *Id.* Yet, the Plan encourages decentralized development throughout the County’s unincorporated lands and will allow sprawl into rural and agricultural areas. *See e.g.*, General Plan Policy P.F-1.2 (Goals and Policies Report I-2-7). In fact, the General Plan’s Guiding Principles specifically call for growth in unincorporated communities. *See* General Plan at A-2 (Principle 1: Opportunities).

I21-25

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 12

The Rural Valley Lands Plan (“RVLP”) is another source of internal inconsistency. The RVLP is touted throughout the General Plan and RDEIR as a means of protecting agricultural resources within the County consistent with the County’s stated goal of preserving “productive and potentially-productive agricultural lands.” General Plan at I-3-4 (Goal AG-1); *see also id.* at I-3-5 (Policy AG-1.8). In reality, however, the RVLP is designed to facilitate the conversion of agricultural lands to non-agricultural uses. According to the “Policy Analysis” provided in the General Plan, the RVLP “does away with the need to amend the General Plan each time a proposed zone change comes before the Planning Commission and Board of Supervisors.” General Plan at II-1-2. Thus, pursuant to the RVLP, the County can re-zone agricultural land within the RVLP area for “urban/suburban types of uses” if the County determines that such uses are more suitable. *Id.* A plan that facilitates the rezoning of agricultural land to allow for urban/suburban uses does nothing to further the goal of preserving agricultural land.

I21-26

To be sure, under the RVLP, the County cannot conclude that land is more suitable for non-agricultural uses if it scores 17 or more points under the RVLP Development Criteria or if it is part of an agricultural preserve. However, the point of the Plan is to take lands out of agricultural use, not to put them in or preserve them. Had the County been true to its goal of preservation, it could have simply applied a land use designation throughout the RVLP area that prohibited (or strictly limited) non-agricultural uses, instead of providing a tool for leapfrog development and sprawl.<sup>3</sup>

I21-27

More specific examples of inconsistent policies abound in the proposed General Plan, including the following:

I21-28

- Contrary to the General Plan’s Guiding Principles that call for maintaining rural separation between cities, communities, and hamlets, the General Plan land use map (Figure 4-1) shows the cities of Visalia, Tulare, and

<sup>3</sup> Moreover, the RVLP creates a kind of planning conundrum. By allowing changes in a parcel’s zoning from agricultural to urban/suburban use without a contemporaneous change in the general plan land use designation, the RVLP appears to authorize a vertical inconsistency between the County’s general plan and zoning ordinance. Under state law, such inconsistency is prohibited. Gov. Code § 65860(a). If, on the other hand, no change in the general plan is required to accommodate a change in zoning because the current land use designation throughout the RVLP area allows both agricultural and urban/suburban uses anywhere, then the RVLP isn’t really a plan at all—it is an area in which anything goes.

I21-29

Page 13

Farmersville becoming one large urban area with no rural separator. <i>See</i> Figure 2.4-1, inconsistent with Guiding Principles Agriculture Principle 2 (Maintain Separators) and Land Use Principle 4 (Rural Separators), p. B-1 to B-2.	I21-28 cont'd
---	------------------

<ul style="list-style-type: none"> <li>Policy RVLP-1.1 “limits” urban development within the RVLP area to “UDBs, <i>UABs</i>, HDBs, and other adopted land use plans which may include urban corridors, planned communities, and the Kings River Plans” (emphasis added). PF-1.2. on the other hand, states that the County shall ensure urban development takes place only in certain areas, excluding <i>UABs</i>.</li> </ul>	I21-30
---	--------

<ul style="list-style-type: none"> <li>Policy AG-1.12 provides that the County “shall discourage the creation of ranchettes in areas designated Valley Agriculture and Foothill Agriculture.” General Plan at I-3-6. However, the Land Use Element allows one dwelling unit per ten acres, with minimum lot sizes of 10-80 acres, on land designated “Valley Agricultural.” General Plan at Table 4.1. A ten-acre parcel with a residence is the epitome of a ranchette.</li> </ul>	I21-31
---	--------

<ul style="list-style-type: none"> <li>The RVLP Criteria and Evaluation Matrix (General Plan at II-1-8) states that an agricultural parcel that is five acres (gross) or larger in size receives four points toward its total score under the RVLP scoring system. The reason for this score is “to prevent further division of large agricultural parcels into smaller parcels, thus limiting their value for agricultural purposes.” <i>Id.</i> However, AG-1.5 and Agriculture Implementation Measure 4 require the County to serve “Non-renewal” notices for Williamson Act contracts on parcels smaller than 10 acres (if Prime Farmland) or 40 acres (if Non-Prime Farmland). General Plan at I-3-5, I-3-9-10.</li> </ul>	I21-32
---	--------

Because these and other policies relating to growth, infrastructure, and the provision of services within the County are inconsistent, the General Plan is legally inadequate.	I21-33
--	--------

Finally, as will be discussed in more detail below, the policies allowing and even encouraging unfettered growth outside of the UDBs will have significant environmental impacts. The RDEIR recognizes this fact, finding nearly two dozen significant and unavoidable environmental impacts caused by this Plan. <i>See</i> RDEIR at ES-12 through ES-26. For example:	I21-34
---	--------

<ul style="list-style-type: none"> <li>Buildout of the General Plan will also be inconsistent with its Air and Water Quality goals. Section AQ-1 directs the County to improve air</li> </ul>	I21-35
---	--------

May 26, 2010  
Page 14

quality and requires development to be located, designed, and constructed in a manner that will minimize cumulative air quality impacts, and new projects should aim to reduce air emissions. *See* AQ-1.3. Additionally, Section AQ-2 directs the County to mitigate air quality impacts associated with the Project. *See* AQ 2.2. Yet, the RDEIR predicts that the Project will result in a cumulatively considerable net increase of criteria air pollutants that result in a violation of air quality standards and could conflict with or obstruct the implementation of an applicable air quality plan. *See* RDEIR at ES-13.

I21-35  
cont'd

- Additionally, Section TC-1 directs the County to promote an efficient roadway and highway system for the movement of people and goods, which enhances the physical, economic, and social environment while being safe, environmentally friendly, and cost-effective. Section TC-1.1 requires the County to establish and maintain a public road network to accommodate projected growth in traffic volume. However, the Project is expected to result in a substantial increase in vehicular traffic and the impact from this increase is categorized as “significant and unavoidable.” *See* RDEIR at ES-12. Yet again, the environmental impacts of the Project are at odds with the Plan’s internal goals.

I21-36

For this reason, as well, the General Plan is internally inconsistent.

## II. The RDEIR Is Legally Inadequate.

I21-37

An EIR is “the heart of CEQA.” *Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal. 3d 376, 392 (“*Laurel Heights I*”). “The purpose of an environmental impact report is to provide public agencies and the public in general with detailed information about the effect that a proposed project is likely to have on the environment; to list ways in which the significant effects of such a project might be minimized; and to indicate alternatives to such a project.” CEQA § 21061. The EIR “is an environmental ‘alarm bell’ whose purpose it is to alert the public and its responsible officials to environmental changes before they have reached ecological points of no return. The EIR is also intended ‘to demonstrate to an apprehensive citizenry that the agency has, in fact, analyzed and considered the ecological implications of its action.’ Because the EIR must be certified or rejected by public officials, it is a document of accountability.” *Laurel Heights I*, 47 Cal. 3d at 392 (citations omitted).

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 15

Unfortunately, the RDEIR for the proposed General Plan fails entirely to live up to this mandate. Like its predecessor, the RDEIR lacks a comprehensible description of the Project and fails altogether to describe the wide variety of types and intensity of uses that could be developed within each of the County's planning areas. In the absence of a comprehensive and detailed description of land uses, the RDEIR is incapable of providing a meaningful analysis of the General Plan's environmental impacts. Thus, rather than seriously grapple with the issue of how unfettered growth would affect the County's lands, the RDEIR routinely defers impact analysis and looks to vague and unenforceable General Plan policies as a panacea for each and every environmental impact. The County once again has chosen to play a game of "hide the ball," leaving the public and decisionmakers with a profoundly distorted view of the General Plan Project and its consequences.

I21-37  
cont'd

**A. The RDEIR's Description of the Project Violates CEQA.**

I21-38

In order for an EIR to adequately evaluate the environmental ramifications of a project, it must first provide a comprehensive description of the project itself. "An accurate, stable and finite project description is the sine qua non of an informative and legally sufficient EIR." *San Joaquin Raptor/Wildlife Rescue Center v. County of Stanislaus* (1994) 27 Cal. App. 4th 713, 730 (quoting *County of Inyo v. City of Los Angeles* (1977) 71 Cal. App. 3d 185, 193). As a result, courts have found that even if an EIR is adequate in all other respects, the use of a "truncated project concept" violates CEQA and mandates the conclusion that the lead agency did not proceed in the manner required by law. *San Joaquin Raptor*, 27 Cal. App. 4th at 729-30.

Furthermore, "[a]n accurate project description is necessary for an intelligent evaluation of the potential environmental effects of a proposed activity." *Id.* at 730 (citation omitted). Thus, an inaccurate or incomplete project description renders the analysis of significant environmental impacts inherently unreliable. Here, the RDEIR for the proposed General Plan does not come close to meeting these clearly established legal standards.

The RDEIR does little to improve upon the inadequate Project Description of the original DEIR. It provides a description of the General Plan that is effectively no description at all. Because the proposed General Plan fails to provide the necessary guidance for land use development, the RDEIR's Project Description lacks the required information regarding the specific location, type and intensity of development that will exist in the County in 2030. The RDEIR includes demographic predictions about the County's future population but fails to provide a comprehensive and a comprehensible description of what would actually be developed on *all* of the County's land.

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 16

**1. The Project Description Lacks Sufficient Information to Determine How It Would Achieve Plan Objectives.**

I21-39

The Project Description provides no information about how growth would occur under the General Plan. The RDEIR asserts that under the General Plan, 75% of new population growth is expected to occur within the UDBs of incorporated cities, while the remaining 25% is expected to occur in the unincorporated areas outside of these UDBs. RDEIR at 2-9, 2-24. However, there is no description anywhere in the RDEIR of how the proposed policies will achieve this ratio, nor any mathematical calculation of the potential for growth in these two areas based on their land use designations. The Policy Alternatives Newsletter cited in the RDEIR does not provide an explanation, either. *See id.* In fact, that document states that the three land use alternatives presented “are still conceptual in nature.” Policy Alternatives Newsletter at 11. In other words, the Newsletter describes three possible patterns of development for decisionmakers to use in determining the ideal end result of development in the County. Yet, it does not propose specific land use designations or policies that could create that end result.

Even assuming the General Plan does somehow distribute land uses to ensure 75% of future growth does occur within Cities’ UDBs, the RDEIR Project Description fails to allocate projected population growth among and within the Cities’ UDBs. It also does not apportion growth that would ultimately be located within the sub-areas, community plan areas, hamlets and corridors. This failure is ultimately attributable to the General Plan itself—the Project Description cannot explain the Plan’s land use program, because the Plan lacks these critical details.

I21-40

In addition, the RDEIR states that the General Plan was designed specifically to achieve and promote consistency with the planning documents of other key land use agencies, most importantly the Cities. RDEIR at 3.1-22. The RDEIR, however, never explains how the General Plan would achieve, or even promote such consistency. It does not identify the relevant planning policies, nor does it lay out any design principles that would promote consistency. In fact, several General Plan policies would have the opposite effect, as discussed further below. Thus, because the RDEIR (and the proposed General Plan) lack fundamental details, it is not possible to evaluate whether the General Plan would achieve its vision and accomplish its goals for the County.

I21-41

David Bryant, Project Planner  
May 26, 2010  
Page 17

**2. The RDEIR Fails to Adequately Describe Those Components of the General Plan That Do Exist.**

I21-42

A fundamental failure in the proposed General Plan – and consequently the RDEIR’s Projection Description – is that the County has not actually undertaken the planning for large portions of the County’s lands. Specifically, plans do not exist for the following planning areas: Allensworth Hamlet Plan (“HP”); Alpaugh Community Plan (“CP”); Balance Rock Mountain Service Center (“MSC”); Balch Park MSC; Blue Ridge MSC; California Hot Springs/Pine Flat MSC; Camp Nelson MSC; Coffee Camp MSC; Delft Colony HP; East Orosi CP; East Tulare Villa HP; Johnsondale MSC; Fairview MSC; Hart MSC; Lemon Cove CP; Lindcove HP; London CP; McClenney Tract MSC; Mineral King MSC; Monson HP; Panorama Park MSC.; Pine Flat MSC; Plainview CP; Ponderosa MSC; Posey/Idlewild MSC; Poso Park MSC; Seville HP; Silver City MSC; Sugarloaf Mountain Park MSC; Sugarloaf Park MSC; Sugarloaf Village MSC; Teviston HP; Tipton CP; Tonyville HP; Waukena HP; West Goshen HP; Wishon MSC; Wilsonia MSC; Woodville CP; Yettem HP. *See* General Plan I-1-4 through I-1-7.

Until plans are adopted in these locations, the County proposes to designate most of these lands as “mixed use.” *See* General Plan at I-4-12. A mixed use designation allows just about anything: retail, office, single and multi-family residential, hotel, recreation, limited industrial, public facilities, and “other compatible uses.” *See* General Plan at I-4-20. In addition, the mixed use designation allows a wide variety of land use intensities and densities. For example, between one and thirty houses could be developed on any one acre of land. *See* General Plan Table 4.1. To complicate matters further, the General Plan lacks any information about the size (i.e., the acreage) of these planning areas. Thus, although the General Plan would allow rampant retail, office, single and multi-family residential, hotel, recreation, limited industrial, public facilities, and “other compatible uses” throughout the County, the RDEIR Project Description fails to actually identify the amount of this development that would occur within each of these planning areas.

The RDEIR’s Project Description fares no better with regard to those areas of the County that have adopted plans. Even here, the document fails to describe what level of development these myriad plans would allow over the next twenty years so that the RDEIR can then analyze the environmental effects from this growth. The RDEIR’s failure to provide a legally adequate Project Description is not surprising given the legal inadequacies of the General Plan itself. As discussed above, there are so many plans and they are in such varying states of disarray that the General Plan is simply incomprehensible and does not come close to serving as a blueprint for growth.

I21-43

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 18

Any reasonably complete description of the Project would identify and describe the wide variety of types and intensity of uses that could be developed within each of these planning areas, assuming the maximum acreage and the full buildout that would be allowed under the mixed use designations. That is, the document must identify the *full* level of residential, commercial, and industrial uses approved by the General Plan. Defining and analyzing the whole of the project being approved is a long-standing requirement under CEQA. The courts have consistently held that an EIR must examine a project's *potential* to impact the environment, even if the development may not ultimately materialize. *Bozung v. Local Agency Formation Com.* (1975) 13 Cal. 3d 263, 279, 282. Because general plans, such as the proposed County General Plan, serve as the crucial "first step" toward approval of any particular development project, the RDEIR must evaluate the amount of development actually allowed by the Plan. *City of Carmel-By-the-Sea v. Bd. of Supervisors of Monterey County* (1986) 183 Cal. App. 3d 229, 244; *City of Redlands v. County of San Bernardino* (2002) 96 Cal. App. 4th 398, 409.

I21-44

In order to accomplish this task, the RDEIR should have included a tabular presentation of the following data for each of the County's planning areas (those with and without adopted plans): (a) existing and projected population and employment figures; and (b) existing and projected acreage, dwelling units and floor area of residential, commercial, industrial, and public land uses. This description must show or describe *where* the new uses will occur and *where* the proposed new uses would represent changes from existing uses. This rudimentary information forms the basis of sound land use planning. From a CEQA perspective, this information is crucial to a thorough understanding of the Project itself and for conducting an evaluation of the General Plan's environmental impacts.

I21-45

It is certainly possible for the RDEIR's Project Description to provide the necessary land use detail. Attached to this letter are the Project Description sections from EIRs for the Butte County 2030 General Plan, the 2007 Monterey County General Plan Update and the Yolo County 2030 Countywide General Plan. The Butte County EIR Project Description makes clear, for example, that it is not sufficient to simply identify how much development could occur in the County; it must also identify where this development could potentially be located. *See* Butte County General Plan EIR at 3-41, 3-43 (Allocation of Development Quantity to Specific Areas) and Table 3-5: Projected 2030 Projected Buildout and Assumptions by Geographic Area, attached as Exhibit 1. The Monterey County General Plan EIR also provides a comprehensive description of existing and proposed land use by planning area and community area for each land use (e.g., residential, commercial and industrial) throughout the County. *See* Monterey County General Plan EIR at 3-14 through 3-22, attached as Exhibit 2.

I21-46

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 19

The Yolo County General Plan does a particularly effective job of presenting its land use maps. While the Yolo County General Plan EIR contains several different land use maps for the County's planning areas— as does the Tulare County General Plan — the noticeable difference with regard to the Yolo County EIR's presentation is that each map clearly delineates land use designations within each of the County's planning areas. *See* Yolo County EIR Figures III-2a to III-2g, attached as Exhibit 3. Finally, the Butte County, Monterey County, and Yolo County General Plan EIRs all identify and describe the full level of development that would accompany buildout of the respective General Plans. *See* Butte County EIR at 3-39 (Exhibit 1), Monterey County EIR at 3-10 (Exhibit 2), and Yolo County EIR at 81(Exhibit 3).

I21-46  
cont'd

The legal failings of the RDEIR's Project Description, and the resulting analysis, stem directly from the legal inadequacy of the General Plan itself. The General Plan and RDEIR must provide this fundamental land use information so that the RDEIR can accurately evaluate the environmental ramifications of the General Plan. The RDEIR preparers should carefully examine and follow the protocols established within the Project Descriptions of the Butte, Monterey and Yolo County EIRs in order to prepare a legally adequate Project Description for the Tulare County General Plan EIR.

I21-47

### **3. The RDEIR Relies on a Shifting Project Description and Uses Different Project Descriptions for Different Impact Analyses.**

I21-48

The failure of the RDEIR to provide a stable Project Description becomes crystal clear in the document's ill-fated attempt to analyze the Plan's environmental effects. Indeed, within each impact analysis, the RDEIR authors appear to be analyzing different projects. CEQA prohibits such shifting of the project description in a way that minimizes a project's actual impacts on the environment. *See City of Santee v. County of San Diego* (1989) 214 Cal. App. 3d 1438, 1450 . Moreover, such inconsistent and conflicting signals about the nature and scope of the Plan render the Project Description "fundamentally inadequate and misleading." *Communities for a Better Env't. v. City of Richmond*, 2010 WL 1645906 at \*8.

The RDEIR, here, uses different project descriptions for different impact analyses. For example, with respect to the transportation, air quality and climate change analyses, the RDEIR provides vague and seemingly generic land use information, stating that the proposed Project *would result in additional Countywide residential and non-residential land use developments*, with many [sic] of the resulting population growth contributing additional vehicle uses on local and regional streets and highways within all of the County's individual planning areas." RDEIR at 3.2-26 (emphasis added). Rather than rely on detailed land use information from the proposed General Plan itself, the

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 20

RDEIR's impact analyses rely on a Tulare County Association of Governments regional travel model that "contains many socioeconomic data attributes including information related to number of households and number of employees per traffic analysis zone." *Id.* at 3.2-21.

I21-48  
cont'd

Had these analyses relied on specific data from the General Plan itself, we would expect to find, for example, the amount of projected vehicle miles traveled that would occur with implementation of the General Plan, as well as a distribution of the vehicle trips based on the location and type of future proposed land uses. Yet, the RDEIR does not appear to contain this information and thus there is no indication that the transportation, air quality or climate change analyses actually analyze the impacts of the General Plan or of some other scenario.

The RDEIR approaches the Project Description in an entirely different manner with respect to the General Plan's impact on public services. Here, the document assumes an estimated growth rate of 2% across the board for all of the unincorporated areas not identified as "communities" in analyzing public service impacts, such as wastewater impacts. RDEIR at 3.9-50. An "assumed growth rate" for unincorporated communities would indicate that the wastewater demand was not based on the General Plan at all. Thus, the RDEIR does not consider the location and type of proposed land uses proposed by the General Plan, but instead relies on population figures to analyze public service impacts.

I21-49

For its consideration of the General Plan's impacts on biological resources, the RDEIR takes yet a different approach in defining the project for purposes of analyzing its biological impacts. The document never actually evaluates how growth expected under the proposed Plan would impact sensitive plant and wildlife communities. Instead, it assesses whether the proposed General Plan, or current State and federal regulations, includes adequate provisions to ensure continued protection of the County's biological resources. RDEIR at 3.11-30. The RDEIR preparers confirm that they have not actually conducted a detailed evaluation of the Project when the document states that "[g]iven the nature of the impacts, it is anticipated that implementation of the project would result in similar impacts within all geographic planning areas of the County. However, impacts to individual habitats and species could vary depending on the specific geographic planning area affected." *Id.* at 3.11-31. Once again, it is not surprising that in the absence of an actual description of the Project, the EIR preparers were not able to conduct the necessary impact analyses with a consistent legally adequate project description.

I21-50

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 21

A fourth approach is taken in the RDEIR's analysis of the Project's impacts on agricultural resources and water supply. There, the RDEIR purports to rely on the number of acres that will be converted from agricultural to urban uses under the Plan. *See* RDEIR at 3.9-7 through -12; *id.* at 3.10-11 through -13. Even in these sections, however, the RDEIR stumbles for want of a clear statement of what development will be allowed where under the General Plan: as discussed elsewhere in this letter, the RDEIR significantly underestimates the amount of agricultural land that could be converted under the Plan.

I21-51

Until such time as the RDEIR includes a legally adequate stable Project Description it will be incapable of analyzing the General Plan's environmental impacts. The RDEIR must be revised to provide a complete and stable Project Description.

I21-52

**B. The RDEIR's Analyses of the General Plan's Environmental Impacts Are Inadequate.**

I21-53

The RDEIR's impact sections for the most part simply name potential impacts of the project and, in most cases, identify them significant and unavoidable. The RDEIR rarely quantifies the impacts, nor even describes their nature and extent. Its analyses read more like a set of general discussions of these types of impacts in a generic county anywhere in California, rather than analyses of how *this* General Plan will effect *this* County. The RDEIR's impact analyses are universally flawed in this manner, because none of them considers the project actually put forth by the proposed General Plan.

The "programmatic" nature of this RDEIR is no excuse for its lack of detailed analysis. Indeed, the RDEIR grossly misconstrues both the meaning and requirements of a "program" EIR by referring to it as a document that "assesses and documents the broad environmental impacts of the program with the understanding that a more detailed site-specific analysis may be required to assess future projects implemented under the program." RDEIR at 1-6. This approach is flawed, at the outset, because CEQA requires that a program EIR provide the in-depth analysis of a large project, looking at effects "as specifically and comprehensively as possible." CEQA Guidelines § 15168(a), (c)(5). Because it looks at the big picture, a program EIR must provide "more exhaustive consideration" of effects and alternatives than can be accommodated by an EIR for an individual action, and must consider "cumulative impacts that might be slighted by a case-by-case analysis." CEQA Guidelines § 15168(b)(1)-(2).

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 22

Further, it is only at this early stage that the County can design wide-ranging measures to mitigate County-wide environmental impacts. *See* CEQA Guidelines § 15168(b)(4) (programmatic EIR “[a]llows the lead agency to consider broad policy alternatives and program wide mitigation measures at an early time when the agency has greater flexibility. . . .”). A “program” or “first tier” EIR is expressly not a device to be used for deferring the analysis of significant environmental impacts. *Stanislaus Natural Heritage Project v. County of Stanislaus* (1996) 48 Cal. App. 4th 182, 199. It is instead an opportunity to analyze impacts common to a series of smaller projects, in order to avoid repetitious analyses.

I21-53  
cont'd

Thus, it is particularly important that the RDEIR for the General Plan analyze now, rather than when individual specific projects are proposed at a later time, the overall impacts for the complete level of development it is authorizing. A General Plan, as the “constitution for all future development,” dictates the location and type of future development in the County. An EIR for a general plan must take into account all of “the future development permitted by the [general plan].” *City of Redlands v. County of San Bernardino* (2002) 96 Cal. App. 4th 398, 409 (citation omitted); *see also City of Carmel-by-the-Sea v. Bd. of Supervisors* (1986) 183 Cal. App. 3d 229, 245. Although legally flawed, Tulare County’s Plan provides sufficient information for analysis of the environmental impacts associated with the buildout allowed under its Land Use Element.

The RDEIR’s analysis must necessarily begin with an identification of the acreage within each and every plan area, including the amount of developed land and land intended for development by the proposed General Plan. The analysis must then assess the location and intensity of the land uses allowed under the General Plan itself as well as under each of the other plans that the County says comprise the General Plan. The analysis must then estimate the amount of development that could be built on those County lands that do not have adopted plans (e.g., community plans and sub-area plans). These plan areas allow an undefined level of mixed use development until such time as the County adopts future plans.

I21-54

In addition, the analysis of the General Plan’s environmental impacts must assume that the maximum allowable residential densities and non-residential building intensities will apply in all unincorporated land and that the allowable density will be fully built out. Where land use designations allow a range of uses and intensities, the environmental impact analysis must assume the highest intensity. Thus, for example, inasmuch as the Valley Agricultural land use designation allows a 10-80 minimum parcel size, given the lack of specific information or direction, the RDEIR must assume that lands with this designation would be built out with a 10- acre minimum parcel size. Likewise, the RDEIR must assume that lands with a “mixed use” land use designation

I21-55

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 23

(e.g., in all community plan locations without an adopted community plan, hamlets, etc.) would be built out with 30 dwelling units per acre. *See* Table 4.1. | I21-55  
cont'd

In addition to considering maximum buildout, another indispensable component of a complete assessment of project impacts is an accurate depiction of existing environmental conditions. Investigating and reporting existing conditions are “crucial function[s] of the EIR.” *Save Our Peninsula Comm. v. Monterey County* (2001) 87 Cal. App. 4th 99, 122 (“SOPC”). “[W]ithout such a description, analysis of impacts, mitigation measures and project alternatives becomes impossible.” *County of Amador v. El Dorado County Water Agency* (1999) 76 Cal. App. 4th 931, 953. Decisionmakers must be able to weigh the project’s effects against “real conditions on the ground.” *City of Carmel-by-the-Sea*, 183 Cal. App. 3d at 246. “Because the chief purpose of the EIR is to provide detailed information regarding the significant environmental effects of the proposed project on the physical conditions which exist within the area, it follows that the existing conditions must be determined.” *SOPC*, 87 Cal. App. 4th at 120 (internal quotation marks omitted). Therefore, the RDEIR must present the existing acreage and dwelling units or floor area of existing uses and uses proposed on the County’s unincorporated lands. The document must also show or describe *where* the new uses proposed would represent changes from existing uses. | I21-56

The RDEIR, here, fails to provide the legally required analysis of the unfettered growth that the General Plan allows and promotes. Thus, in addition to preparing a legally valid General Plan that comprehensively plans for all unincorporated County land, the County must revise the RDEIR to accurately disclose the impacts of the maximum density allowed by the General Plan it does propose to adopt. Below, this letter details the specific legal inadequacies of the RDEIR’s various impact sections. | I21-57

**1. The RDEIR’s Analysis of and Mitigation for the General Plan’s Agricultural Impacts Is Inadequate.** | I21-58

**(a) The RDEIR Fails to Describe the Current Distribution and Designation of Agricultural Land.**

The RDEIR’s description of the current state of agricultural land in the County is lacking crucial information. Every analysis of a project’s environmental effects must begin with the description of the environmental conditions before the project – the baseline. *See Save Our Peninsula Committee v. Monterey County Board of Supervisors* (2001) 87 Cal. App. 4th 99, 122. In considering impacts to agricultural lands, the crucial issues are how much agricultural land is under threat of development, and where the threatened land is located. To that end, the RDEIR contains two important

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 24

maps (Figures 3.10-1 and 3.10-2) showing the location of Important Farmlands and “Williamson Act Classifications” throughout the County. However, this information is virtually useless without a description or depiction of how these lands relate to the land use designations proposed by the General Plan. In other words, what the RDEIR is missing is a discussion of which agricultural lands could be developed under the General Plan. Thus, what is needed is a map showing where important farmlands are located in relation to the proposed urban boundaries of incorporated cities, unincorporated communities, and hamlets, along with some description of the types of development allowed there.

I21-58  
cont'd

In lieu of this information, the RDEIR assumes that all land within the “Rural Valley Lands Plan unincorporated community areas” would be built out. RDEIR at 3.10-13. Table 3-10.9 defines these areas as the areas within the Cities’ urban area boundaries, the hamlet development boundaries, and the urban development boundaries of 22 unincorporated communities. All told, development of these areas would result in the conversion of nearly 60,000 acres of important farmland. However, these figures do not include the vast potential for development outside these boundaries created by the General Plan. Most of the RVLP area appears to be designated “Valley Agricultural,” which allows 1 dwelling unit per 10 acres. General Plan at Table 4.1. Thus, ranchette development outside the urban development boundaries of cities and communities is another source of potentially significant impacts on agricultural land. Moreover, “Planned Community Areas” are also allowed under the RVLP. General Plan at Table 4.1. Because the General Plan does not specify where these planned communities could or could not be developed, the RDEIR must assume they could be developed anywhere within the RVLP area.

I21-59

Figures 3.10-1 and 3.10-2 are also inadequate because they show only actual uses, not the existing land use designations. That is, the RDEIR does not show how land uses could potentially change under the current General Plan, without the proposed update; such analysis is required under CEQA Guidelines section 15125(e). It is impossible to evaluate how the Project will change the current General Plan without a clear picture of the Plan as it stands today.

I21-60

In sum, the RDEIR must be revised to provide a clear, complete picture of current and proposed uses for agricultural lands within the County, or it will remain inadequate.

I21-61

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 25

**(b) The RDEIR Underestimates the Amount of  
Agricultural Land Threatened with Development  
Under the General Plan.**

I21-62

The RDEIR acknowledges that “future growth resulting from implementation of the proposed project would result in both the direct and indirect conversion” of more than 59,000 acres of important farmland. RDEIR at 3.10-11. While this impact is rightly designated “significant,” it is a vast understatement of the important farmland jeopardized by this proposed General Plan.

The RDEIR’s calculation of important farmland likely to be converted by the Project assumes only “full build-out of the Rural Valley Lands Plan unincorporated community areas” and “growth within the unincorporated community areas of the Foothill Growth Management Plan Area.” RDEIR at 3.10-13. More specifically, this calculation includes only land within the UDBs incorporated cities and unincorporated communities, the UABs of incorporated cities, and Hamlet Development Boundaries. *Id.* at 3.10-13.

However, the General Plan allows far more farmland to be converted than exists within the UDBs, UABs, and HDBs. According to the Land Use Element, “Planned Communities” appear to be allowed *anywhere* in the RVLP area. General Plan at 4-8 (Table 4.1). These Planned Communities are essentially new communities developed according to one Master Plan in places where no community currently exists. General Plan at I-4-20 to 21. They may include residential, commercial, administrative, and industrial uses, with a maximum density of 30 dwelling units per acre. *Id.* Moreover, pursuant to the Corridors Framework Plan, mixed-use development is allowed along many of the County’s transportation corridors, which crisscross agricultural lands. General Plan at II-2-1.

According to the RDEIR, a majority of the County’s important farmlands are located in the RVLP area, outside of the urban and hamlet development boundaries. RDEIR at 3.10-11. Although there is no quantification of the number of acres of important farmland within the RVLP area, the County contains over 700,000 acres of important farmland and, according to Figure 3.10.1, nearly all of it appears to be within the RVLP area. Because Planned Communities could be developed anywhere within the RVLP area, full buildout under the General Plan could convert hundreds of thousands—not tens of thousands—of acres of important farmland to urban uses. The RDEIR thus significantly understated the Project’s potential impacts on agricultural resources.

& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 26

(c) **The Proposed General Plan Will Result in Early Termination of Active Williamson Act Contracts.**

I21-63

The RDEIR concludes that the proposed General Plan will not have a significant impact on agricultural resources because it will not result in early termination of active Williamson Act contracts. RDEIR at 3.10-17. However, this conclusion is directly contradicted by policies and implementation measures in the General Plan by which the County expressly states its intent to pursue and encourage the early termination of Williamson Act contracts. For example, AG-1.4 states that the County “shall support non-renewal or cancellation” of contracts within UDBs and HDBs. General Plan at I-3-4. Contrary to the representation in the RDEIR, this policy does not serve to limit the County’s support of contract non-renewal or cancellation, but rather states an affirmative policy of support for non-renewal and cancellation within UDBs and HDBs. *See* RDEIR at 3.10-17 (representing that AG-1.4 “only supports Williamson Act non-renewal or cancellation . . . for lands within CACUDB and HDB areas”).

Implementation Measure 3 goes even further, requiring the County to maintain a database of contracted agricultural preserves within UDBs of unincorporated communities and to review this database at regular intervals to determine “whether any unincorporated community in the County is unduly constrained or confined by land contracted under Williamson Act.” General Plan at I-3-9. If development of an unincorporated community is so constrained, Implementation Measure 3 *requires* the County “encourage the land owner to file a notice of non-renewal so that the contract on the property could be terminated nine years from that date.” *Id.*

Policy AG-1.4 and Implementation Measure 3 set a clear course for the County with respect to Williamson Act contracts: eliminate them if they will impede the sprawling growth planned around cities, unincorporated communities, and hamlets.<sup>4</sup> According to the RDEIR, there are over 60,000 acres of contracted lands within the County’s “unincorporated community areas.” RDEIR at 3.10-16.<sup>5</sup> Moreover, a

<sup>4</sup> AG-1.8 further defines this course, stating that “the County shall not approve applications for Williamson Act contracts on lands within a UDB or HDB unless it can be shown that the restriction of land to agricultural use will not “detrimentally affect the growth of the community.” General Plan at I-3-5.

<sup>5</sup> It is not clear whether this figure includes contracted lands within the UDBs of the eight incorporated cities. If not, even more contracted land is at risk from these policies.

I21-64

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 27

comparison of the “Land Use Diagram” (Figure 2-2- of the General Plan) and the map of “Williamson Act Land” (Figure 3.10-2 of the General Plan) suggests that some of the proposed development boundaries surrounding unincorporated areas may overlap with Farm Security Zones.

I21-63  
cont'd

By encouraging non-renewal of the contracts covering these lands, the General Plan will not only result in their early termination, but will also result in the conversion of agricultural land to urban uses, as the reason for non-renewal or cancellation is generally to make way for urban development. In addition, the conversion of some contracted lands to urban uses will increase development pressure on neighboring parcels, increasing the likelihood that even more agricultural lands will be converted. *See* Exhibit 4. These impacts are significant and must be analyzed as such in a revised and recirculated EIR.

The General Plan also sets forth policies and implementation measures requiring the County to seek the early termination of Williamson Act contracts for parcels smaller than 10 acres (if the land is Prime Farmland) or 40 acres (if the land is Non-prime Farmland). Specifically, AG-1.5 provides that “[t]he County may work to remove parcels that are less than 10 acres in Prime Farmland and less than 40 Acres in Non-Prime Farmland from Williamson Act Contracts.” *Id.* at I-3-5. Implementation Measure 4 then *requires* the County to serve notices of non-renewal on contracts for parcels that are smaller than 10 acres of Prime Farmland or 40 acres of Non-prime Farmland. General Plan at I-3-10.<sup>6</sup>

These policies will result in the early termination of Williamson Act contracts on smaller parcels throughout the county; indeed, that is their very purpose. None of the planning documents provided to the public indicates how many acres of farmland will be converted on account of these policies. Moreover, these parcels need not be located within the UDBs of any city or unincorporated area. Thus, their cancellation could result in the conversion of agricultural lands to urban uses anywhere in the County. The RDEIR must be revised and recirculated to indicate how many acres of

<sup>6</sup> The General Plan incorrectly states that such parcels “do not meet the minimum parcel sizes set forth under § 51222 of the California Government Code.” *Id.* The Government Code contains no such “minimum parcels size” required to qualify for a Williamson Act Contract. Rather, the cited statute provides that parcels bigger than 10/40 acres of Prime/Non-prime Farmland are presumed to be big enough to support commercial agriculture. Gov. Code § 51222.

I21-65

David Bryant, Project Planner

Page 28

Williamson Act contracted lands will be affected by these policies, and to analyze the potentially significant impacts of converting this additional acreage from farmland to urban use.	I21-63 cont'd
--	------------------

<b>(d) The RDEIR Fails to Provide Sufficient Mitigation for the General Plan's Agricultural Impacts.</b>	I21-66
--	--------

The RDEIR concludes that the Project's significant impacts on agricultural resources are unavoidable, leaving unmitigated the conversion of tens of thousands of acres of important farmland contemplated by the General Plan. In doing so, the RDEIR overlooks numerous feasible mitigation measures.

The simplest measure of all, of course, is to revise the proposed policies and implementation measures that will cause this massive conversion. One obvious candidate for revision is RVLP-1.1. As proposed, that policy "limits" non-agricultural development to "UDBs, UABs, HDBs, and other adopted land use plans which may include urban corridors, planned communities, and the Kings River Plans." However, as discussed above, planned communities are permitted anywhere in the RVLP area. Urban corridors, likewise, could be designated along many transportation corridors in the County. General Plan at II-2-1 (Corridors Framework Plan). Moreover, by the County's own definition, UABs should not be developed until communities have expanded to the edge of their UDBs. General Plan at I-2-49. Thus, at the very least, the County could remove "urban corridors," "planned communities," and "UABs" from the list of areas where non-agricultural development may occur as a means of reducing conversion of agricultural land.	I21-67
--	--------

Another candidate for revision is PF-1.2. That policy directs urban development to the UDBs of incorporated cities, unincorporated communities, planned community areas, HDBs, and "other areas suited for non-agricultural development, as determined by the procedures set forth in the Rural Valley Lands Plan." General Plan at I-2-7. Like RVLP-1.1, PF-1.2 could be revised to significantly limit where urban development can take place within the County, and thereby reduce the General Plan's potentially significant agricultural impact.	I21-68
---	--------

In addition, the County could include an Agricultural Conservation Easement Program as part of the General Plan, rather than adopting policies that simply require the County to consider one at some unspecified time in the future. RDEIR at 3.10-15; General Plan at I-3-5. The Department of Conservation has suggested this approach in commenting on Solano County's General Plan. See Exhibit 4 (Letter from Dept. of Conservation to Solano County). Such a program would require applicants	I21-69
--	--------

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 29

seeking to convert agricultural land to urban uses to “purchase conservation easements on land of at least equal quality and size as partial compensation for the direct loss of agricultural land, as well as for the mitigation of growth inducing and cumulative impacts on agricultural land.” *Id.* at 3. The policies included in the current draft of the General Plan, on the other hand, are not mandatory and thus are unenforceable.

I21-69  
cont'd

The policies and implementation measures supporting or requiring early termination of Williamson Act contracts could also be eliminated. *See* AG-1.4, AG-1.5, AG-1.8; Implementation Measures 3, 4.

I21-70

Revisions to AG-1.13 could also reduce the General Plan’s impacts on agricultural resources. Policy AG-1.13 provides that the County “shall allow agriculturally-related uses” such as processing facilities in areas designated Valley or Foothill Agriculture. However, as the RDEIR points out, one significant cause of lost farmland in the County is the expansion of precisely these types of facilities. RDEIR at 3.10-13 (noting that the expansion of new dairy/livestock operations has contributed and will continue to contribute to the conversion of important farmland). Thus, the County could prevent further conversions of important farmland by changing AG-1.13 to limit these facilities to other types of land (e.g., grazing land).

I21-71

**2. The RDEIR Inadequately Analyzes and Mitigates the General Plan’s Land Use Impacts.**

I21-72

**(a) The RDEIR Fails to Adequately Analyze the General Plan’s Potential Conflicts with the Cities’ Plans.**

The RDEIR boldly asserts that “[t]he proposed project was designed specifically to achieve and promote consistency with the planning documents of other key neighboring land use agencies or other agencies that may have jurisdiction over future projects anticipated under buildout of the General Plan Update.” RDEIR at 3.1-22. The document then concludes that the Project’s potential to conflict with adopted local land use plans would be a less than significant impact. *Id.* The RDEIR, however, provides *no analysis* to support this conclusion. Had the RDEIR actually conducted the analysis of the Project’s consistency with other plans, and particularly the Cities’ general plans, it would have determined that (1) the Project was certainly not designed to promote consistency with these plans; and (2) the Project’s incompatibility and inconsistency with the Cities’ general plans constitute a significant impact.

As discussed above, the proposed General Plan includes eight “County Adopted City General Plans” (“CACGP”), which are intended to govern development in

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner

May 26, 2010

Page 30

the areas surrounding the County's eight incorporated cities. General Plan at I-1-4. Contrary to what their name implies, these plans are not the Cities' own general plans, which typically include land use designations for the areas within the Cities' UDBs and UABs. Instead, the CACGPs are plans developed by the County. *See* Tulare County General Plan, Part III. Moreover, many of the CACGPs date back decades, while many of the Cities' general plans have been updated recently to reflect current conditions. Thus, contrary to the RDEIR's assertion, the proposed General Plan could not have been designed to promote consistency with the Cities' general plans.

I21-72  
cont'd

Nor are the CACGPs consistent with the Cities' general plans. A preliminary review of the Cities' general plans reveals critical discrepancies between the Cities' and the County's planning efforts. At the most fundamental level, the CACGP and the Cities' general plans contain different planning boundaries. The UDBs and UABs established in the CACGPs do not reflect the Cities' UDB and UABs. Specifically, the CACGP's boundaries for the Cities of Dinuba, Exeter, Porterville, Tulare, and Visalia vary from these Cities' planning boundaries. *See* City General Plan Documents, attached as Exhibit 5. Because the future growth within the County will occur within these unincorporated areas near cities (*see* General Plan Policy P.F-1.2 at I-2-7 and RDEIR at 2-9), it is vitally important that there be no debate as to the exact physical delineation of these planning areas. Moreover, because the Cities' UDB boundaries reflect the planning area in which the Cities are able to effectively and efficiently plan for the provision of infrastructure and services, it is critical that the County's planning boundaries match the Cities' designated boundaries (both UDB and UAB).

I21-73

In addition to the discrepancies in planning boundaries, the CACGPs and the Cities' general plans often have different land use designations for the same property. For example, land use designations adopted by the cities within the planning boundaries of Visalia, Farmersville and Dinuba appear to differ significantly from those proposed by the County General Plan:

I21-74

(i) **Visalia**

The County relies on an outdated 1992 County adopted General Plan Land Use Map for Visalia's CACGP rather than Visalia's current Land Use and Circulation Element Map, which was most recently updated in 2010. *See* Exhibit 6. Not surprisingly, the land use designations on the two maps are inconsistent. *Id.* For example, the land just east of Road 100 and north of Avenue 272 was designated "Agriculture" in the 1992 map but is designated "Urban Reserve" in the 2010 Map, indicating that the land will be developed in urban uses when the City's population

I21-75

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 31

reaches 165,000. Similarly, land just north of Avenue 272 and south of Avenue 276 was designated "Agriculture" in the 1992 map but is currently designated "Urban Reserve" in the 2010 Map. *Id.* | I21-75  
cont'd

(ii) **Farmersville**

The County relies on a 1976 land use map for its Farmersville CACGP. *See* Exhibit 6. The land use designations in this 1976 map are inconsistent with the land use designations identified in the City's 2002 General Plan. For example, the area just south of Avenue 288 and west of Farmersville Boulevard (to the West of North Ventura Avenue according to Google Map) is designated "Agriculture" in the 1976 Land Use Plan but designated "Medium Density Residential" in the current 2002 Land Use Plan. Land north of Walnut and west of 168 was designated "Agriculture" in 1976 but is now designated "Medium Density Residential." | I21-76

(iii) **Dinuba**

The County relies on a 1964 land use map for its Dinuba CACGP rather than the City's 2008 current land use map. *See* Exhibit 6. Again, it comes as no surprise that the land uses shown in these two documents do not match. The area to the south of El Monte Way and west of Alta Avenue is shown as the limit of designated residential uses on the 1964 map, and all lands to the west are designated "Agriculture" except for a narrow strip along Alta Avenue. *Id.* The City's 2008 map shows the same area in the middle of the city with land use designations of "Professional Office," "Residential," "Neighborhood Commercial," "Public-Semi Public" and "Urban Reserve" extending westward to Road 56. *Id.* The same situation exists for the area south of El Monte Way and east of Crawford Avenue, which was largely designated as agricultural land in 1964 and is now designated as "Residential," "Neighborhood Commercial," "Public-Semi Public," and "Urban Reserve" eastward to Road 96. *Id.* | I21-77

The inconsistencies between the Cities' and County adopted General Plans extend beyond the variations in planning boundaries and land use designations. The proposed General Plan is also blatantly inconsistent with the provisions in the Cities' General Plans that require annexation prior to development. *See e.g.*, City of Visalia Policy 6.2.5 (Annexation to the City is the appropriate method for urbanization within the Visalia Urban Area Boundary) and Policy 6.2.6 (Annexation of land outside of the current Urban Development Boundary may be permitted only if: (a) the proposal is required for orderly and efficient land use planning with Visalia's planning area, and (b) the land is designated consistent with the City's Land Use Element Map), attached as Exhibit 5-F; *see also* City of Porterville Implementation Policy LU 1-3 (calling for the | I21-78

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 32

UDB to be amended in order to guide growth through annexation and development, and the efficient extension of public services to new areas), attached as Exhibit 5-D. Yet, because the proposed County General Plan actually encourages County approved development within the Cities' planning boundaries and does not ensure this development occurs only upon annexation to the Cities, the General Plan would result in extensive environmental impacts. These impacts are discussed below.

I21-78  
cont'd

Thus, even if the County were to adopt land use designations that were consistent with the Cities' General Plans' land use designations, this would not begin to resolve the significant land use impacts created by the proposed General Plan. The only approach capable of sufficiently mitigating the proposed General Plan's land use impacts is to include the policies and framework necessary to ensure that development occurs only when the Cities are ready to annex so that development is consistent with Cities' land use plans and standards for development.

**(b) The RDEIR Fails to Analyze the Land Use Implications Associated with the General Plan's Weakening of the "Annexation Referral Policy" and Lack of Cooperation with Cities.**

I21-79

Currently, the Tulare County General Plan establishes a policy requiring referral of proposals for development projects within city UDBs to affected cities for potential annexation and development. The purpose of this policy is to attempt to ensure that growth adjacent to city boundaries is orderly, and is timed and designed so that there are adequate City services available for these new developments. While the prior referral policy did not always achieve its intended results, the answer is not to abandon the policy, but rather to strengthen the policy to improve coordination and cooperation between the County and Cities.

The County's new approach – as reflected in policies PF-1.2, PF-4.13 and PF-4.24 of the proposed General Plan – essentially abandons the existing referral policy. While the County "may work with a city" when considering development proposals within the city's UDB, such coordination is not mandatory. See PF-4.18 through 4.27. In fact, pursuant to PF-4.13, the County could approve a project within a city's UDB even when the city does not consent to annexation of the project site. A city's refusal to annex a project site most likely indicates the city's judgment that the proposed use does not fit with its land use blueprint and will not promote contiguous compact growth that is consistent with city development standards and compatible with future planned infrastructure. In other instances, it is simply not possible for a city to annex the project site. For example, if unincorporated land lies between the development site and a city's

SHUTE, MIHALY

Page 33

municipal boundary, and the owner of the intervening property is unwilling to annex, the city would be unable to annex the property.

I21-79  
cont'd

Policy PF-4.13, however, allows the County to approve the proposed development anyway. As discussed below, this second-guessing is clearly a formula for land use impacts. With no effective annexation referral policy, the County will be free to approve any project it finds appealing within the Cities' UDBs. However, county planning programs typically focus on agricultural land uses and do not have experience with the issues and design techniques associated with urban development. As a result, urban developments permitted by counties are often poorly designed with inadequate improvements and infrastructure. *See Michelle Anderson, Cities Inside Out: Race, Poverty, and Exclusion at the Urban Fringe*, 55 UCLA L. Rev. 1095, 1106–08, 1144–52 (2008), attached as Exhibit 7.

Tulare County is no different. In the past, County forays into this type of development have been disastrous. For example, the County recently approved the development of a church on land just outside Visalia's municipal boundary. After extensive negotiations between the County and the developer, the County approved the Calgary Worship Center without requiring strict adherence to the Visalia's development standards. Conversation with Mike Olmos, Visalia City Community Development Director/Assistant City Manager, May 12, 2010 (Olmos, 2010). The County allowed the development to proceed without requiring sufficient street improvements, sidewalks, streetlights, and landscaping. Critically, the County did not even require connection to a municipal wastewater system, and consequently the church must service its wastewater needs with a septic tank. *Id.* Had the developer been held to City standards, the church property would have been developed with each of the aforementioned improvements. In addition, the church would not have been approved with a septic system; instead it would have been required to connect to municipal or another public wastewater system provider. The problems caused by these mismatched standards will inevitably become the City's, once its boundaries expand, as planned, toward the UDB.

I21-80

As the attached photograph of the Calgary Worship Center shows, County-approved development is the antithesis of sound land use planning principles. Indeed, it offers a textbook example of the type of conflict that can arise when the County allows premature urban conversion of agricultural lands. *See Exhibit 8.* This development is not city-centered or even immediately contiguous to urban development in the City. Instead, it leaps over agricultural land and thus sits as a small island in a sea of farmland. Thus, not only did the County allow the development of valuable fields, but by encroaching into active farming operations, the church itself, or church patrons, will likely complain about pesticide sprays, dust, odors, noise and other normal aspects of farm operation.

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 34

The County's decision to allow an urban use in the midst of active farmland results in a classic farm-urban edge conflict. While Visalia's General Plan ultimately contemplates urban development in this location, the development would have occurred as part of an orderly, well-timed and well-designed expansion of municipal boundaries.

I21-80  
cont'd

The Matheny Tract is another example. In the late 1940s, the County approved the Matheny Tract, located just south of the City of Tulare city limits. Over the years, this community has grown to a 900-resident enclave. Unfortunately, according to Tulare Vice Mayor Phil Vandegrift "little to no building standards were followed, leading to serious lack of infrastructure." *See* Matheny Tract articles, attached as Exhibit 9. Consequently, the Matheny Tract has been struggling with substandard infrastructure and the community is forced to live with a contaminated water supply. According to Vandegrift, "[w]ater, sewer, street, curb and gutter improvements, with an estimated \$8 million price tag, must be completed to bring up the enclave's infrastructure to city standards." *Id.* For the last three years, City staff has been working with this community to help secure a state grant to upgrade the community's water system and possibly tie into the City of Tulare's water system.

I21-81

Ignoring the fundamental planning principal that incompatible land uses should be separated from one another, the County also recently approved the expansion of an existing "recycling center" directly adjacent to the City of Tulare. Two residential subdivisions are located within 120 feet of the recycling center and the City proposes to develop a school very close by. *See* City of Tulare SA Recycling Appeal at 7, attached as Exhibit 10. The expanded recycling center would include, as part of its operations, the wrecking and crushing of car bodies, even though such uses are not generally allowed under the County's own zoning standards. *See id.* at 1, 3. Approval of an expanded automobile wrecking and crushing operation adjacent to a residential neighborhood and a school will likely result in significant impacts to nearby residents including excessive noise, increased traffic, visual blight, and potential health risk due to exposure to hazardous substances.

I21-82

It is noteworthy that the County clearly recognizes the harm that can accompany County-approved development within cities' planning boundaries inasmuch as it calls for limiting development within a CACUDB if a city enters into a "revenue sharing agreement" with the County. *See* General Plan Implementation Measure 27 at I-2-77. As this measure demonstrates, the County intends to base its land use decisions not on sound urban planning principles or environmental protection, but instead on financial compensation. Moreover, such a policy causes all sorts of uncertainty. Indeed, it is impossible to determine the amount of development that would occur within the Cities' UDBs, if the County intends to alter its development plans based on city-by-city "revenue

I21-83

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 35

agreements.” This further implicates the RDEIR’s faulty Project Description and the ability of the EIR preparers to evaluate the General Plan’s environmental impacts.

I21-83  
cont'd

(i) **Premature leapfrog development.**

I21-84

The examples of County-approved developments within Cities’ UDBs and UABs discussed above also provide real-world examples of the potential environmental impacts such uncoordinated planning can have. The first set of impacts are those related to leapfrog development. Leapfrog development is development separated from continuous urban development by vacant, low density, or rural land. This type of development is even worse than sprawl in that it skips over land available and suitable for development and instead consumes large tracts of land. Development leaps to outlying and isolated areas because the cheapest land tends to be the furthest from urbanized city centers.

The reactionary and haphazard nature typical of County-approved development on lands within the Cities’ UDBs results in precisely this type of leapfrog development. A landowner or a developer applies for an entitlement such as a subdivision on these comparatively distant lands because the land is less expensive and therefore more fiscally beneficial for development. In addition, the County’s development standards are considerably less stringent than those required by the Cities, and development impact fees, if any exist at all, are nominal in comparison to the Cities’ fees. The fiscal benefits of development on unincorporated lands, coupled with the proximity to the Cities’ comparatively ample public services and amenities, make development on the County’s lands very attractive. More often than not, the County grants the approval, which typically results in comparatively low density development without adequate public services. (Olmos, 2010).

Indeed, development proposals occurring in counties tend not to achieve the densities or land use patterns contemplated by cities’ general plans. This is largely because adequate infrastructure such as sewer and water is often unavailable to meet the needs of more urban (i.e., higher) densities. City-centered development within city limits, on the other hand, occurs in accordance with a municipality’s general plan, which tends to promote a contiguous, compact, higher density development to ensure an orderly and efficient transition from rural to urban land uses. The County’s Cities have specific General Plan’s policies and goals calling for growth to occur in a concentric pattern, contiguous to existing developed areas. For example:

- City of Porterville Policy 4.1 LU-G-2: Maintain a well-defined, compact urban form with Downtown as the “heart of the City;” Policy LU-I-5:

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner

May 26, 2010

Page 36

Require contiguous development within the UDB unless it can be demonstrated that development of property which is contiguous to urban development is unavailable (*see* Exhibit 5-D);

I21-84  
cont'd

- City of Exeter Annexation Policy 90-01 and 10-year annexation line. This policy and annexation line place restrictive controls on residential growth in Exeter. The objective of these two growth control measures is to promote residential infill development and a development pattern that is generally contiguous to existing development and concentric to Exeter's downtown (*see* Exhibit 5-B);
- City of Dinuba Planning Principle stating that new development should take place in a concentric pattern, contiguous to existing developed areas; Objective A: Provide for an orderly and efficient transition from rural to urban land uses; and, Objective B: Minimize urban sprawl and leap-frog development (*see* Exhibit 5-A).

Cities seek to avoid leap frog development because it is an extremely inefficient method for providing infrastructure, because it paves over productive farmland, and because it adversely affects a city's cohesiveness, character and ambiance.

Perhaps most disturbing, the County's proposed General Plan would allow regional commercial development, industrial development, office parks and highway commercial development along "corridors" located inside city UDBs and UABs. Again, because the General Plan allows approval of these types of uses prior to the preparation and adoption of Corridor Plans, the County will face pressure to approve development before a coherent plan for development is in place. As a result, developments will occur haphazardly throughout the County's lands. The RDEIR fails to recognize that development under the General Plan could result in these sprawling, leap frog development patterns and therefore fails to analyze the environmental effects from this type and amount of development.

(ii) **Interference with the Cities' ability to provide adequate infrastructure and public services and associated environmental impacts.**

I21-85

As the examples above demonstrate, when the County permits urban development within the Cities' UDBs and UABs, the resulting development typically lacks adequate infrastructure and services. The reason for these inadequacies is that the County's development improvement standards and facility financing and maintenance

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 37

mechanisms are less stringent than the Cities' standards and mechanisms. (Olmos, 2010). The County might not mandate right-of-way improvements, such as roadways and catch basins scaled to future development levels, where the city would impose such requirements. Or the County might allow the use of individual septic systems in an area where the city is concerned about groundwater quality and planned to extend sanitary sewer lines.

I21-85  
cont'd

Without adequate infrastructure, improvements, and services (e.g., storm drains, streetlights, sidewalks, or drinking water), developments permitted by the County can result in serious environmental, health and safety impacts. One recent study documents the type of impacts that can occur when basic infrastructure and services are lacking:

[t]hese disparities can be dangerous, such as the illnesses caused from unsafe drinking water, the heightened likelihood of mosquitoes carrying West Nile virus as a result of standing water arising from inadequate storm drains, and the higher rates of traffic accidents on poorly maintained roads. Or, they can chip away more slowly at the prospects for building a strong community, when there is illegal dumping, poor sanitation service, few or no recreation facilities for youth, and dilapidated schools.

*See Unincorporated Communities in the San Joaquin Valley: New Responses to Poverty, Inequity, and a System of Unresponsive Governance, attached as Exhibit 11.*

Providing a safe and adequate public drinking water supply is already a major problem in Tulare County. Shallow domestic wells are contaminated with nitrates, a byproduct of fertilizer, dairy farms, and leaky septic tanks. *See Nitrates in Our Drinking Water, Part 1 – The Present Threat, The California Report (May 14, 2010), attached as Exhibit 12.* In addition, communities that are not served by public water providers must rely on wells for their drinking water. These same communities that suffer from poor water quality also tend to lie beyond the boundaries of public sewer systems, and thus rely on individual septic systems. However, these septic systems only compound the water quality problems in the area, as they can result in elevated nitrate levels in ground and surface water bodies.

I21-86

County-initiated development within cities' planning boundaries can adversely impact cities over the long term. Because County-approved development does not meet the Cities' strict development standards, it makes it difficult to assimilate these communities into the Cities, as the Cities' boundaries expand. The financial burden of extending infrastructure in and around these poorly designed unincorporated

I21-87

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 38

neighborhoods can be overwhelming, and is placed squarely on the shoulders of the neighboring cities, not the County. At the same time, some of the communities with the greatest environmental, health and safety problems – and that would benefit the most from the utilities and services provided by cities – are the most resistant to annexation efforts. Annexing *established* communities, as opposed to proposed developments, is often fraught with complications as residents often oppose annexation efforts. While residents may be frustrated with the County's level of service, they nonetheless have become accustomed to living in the County. In some instances, residents simply feel an allegiance to the County rather than the City, or they may prefer the County's more lenient approaches toward code enforcement, or the County's lower tax rates.

I21-87  
cont'd

The RDEIR analyzes none of these potentially significant impacts associated with uncoordinated growth along municipal boundaries. As a result, the RDEIR violates CEQA.

**(iii) Land use conflicts.**

I21-88

In the absence of coordination with the Cities and policies that ensure development occurs together with annexation, County-approved development within the Cities' UDBs will inevitably result in land use conflicts. The General Plan's policies for development within UDBs frequently conflict with the Cities' own policies for development there and within the Cities' UABs. As the examples identified above show, if the County proceeds in approving development under its CACGP alone, these conflicting policies will likely lead to conflicting land uses down the road along with conflicts with Cities' development and improvement standards and public facility plans. In the absence of General Plan policies that ensure development is city-centered and coordinated with annexation, the General Plan will result in land-use conflicts and the associated environmental impacts (e.g., exposure to offensive odors, dust and other air pollutants, excessive noise levels and traffic congestion). The RDEIR must be revised to analyze these potentially significant impacts.

**(iv) Increased use of the Cities' services and facilities**

I21-89

The General Plan provisions allowing the County to permit development adjacent to city boundaries will also likely result in increased demand on the adjacent city's public services, such as parks and libraries. Appendix G to the CEQA Guidelines provides that a project will have a potentially significant environmental impact if it would "increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated." Counties typically provide far fewer acres of parkland per resident than

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 39

cities. Thus, residents from County developments within the UDBs will likely turn to City parks, increasing their use.

I21-89  
cont'd

While the County operates parks within or adjacent to some Tulare County cities, the County does not provide parks in or around the cities of Dinuba, Woodlake, Exeter, Farmersville or Porterville. *See* Map of Tulare County Parks and Recreation, attached as Exhibit 13. County residents, however, do not pay the municipal taxes or impact fees to support these services and amenities. This comes at a time when cities' budgets are already substantially reduced given the bleak fiscal climate. Consequently, cities that are struggling to even maintain their current level of operation for city residents find that they cannot accommodate the increase in demand caused by County residents.

County-approved development within the Cities' UDBs and UABs will also increase the demand on Cities' police and fire protection services, possibly necessitating the construction of new facilities to maintain acceptable response times. This impact is considered a potentially significant impact under CEQA Guidelines, Appendix G. Although Tulare County and the Cities may have automatic and mutual aid agreements, which require the provision of police, sheriff and fire service between the Cities and the County, in practice, the Cities' police and fire service bear the brunt of these agreements inasmuch as city staff responds to calls from County residents. (Olmos, 2010). Rarely, if ever does the County provide sheriff and fire service to the Cities' residents. *Id.* Authorizing County development adjacent to cities will only increase this burden on the Cities, and may require the Cities to develop new police and fire facilities to ensure the public safety. The RDEIR must consider this potential significant impact.

I21-90

**(c) The RDEIR Fails to Consider Effective Mitigation for the General Plan's Land Use Conflicts.**

I21-91

The RDEIR is clearly incorrect when it concludes that the General Plan would not conflict with adopted land use plans. Significant environmental impacts will result not only from the conflicts with the Cities' general plan designations, but also because the County general plan will result in uncoordinated growth that is inconsistent with city standards. The only way to avoid such conflicts is to revise the General Plan policies to ensure that the County's growth is city-centered and occurs along with annexation of the property. Without this alteration, the General Plan will remain in conflict with city land use plans and result in significant environmental impacts, impacts the RDEIR must acknowledge, analyze and mitigate.

**3. The RDEIR's Analysis of and Mitigation for the General Plan's Transportation Impacts Is Inadequate.**

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 40

**(a) The RDEIR Contains No Evidence that Its  
Transportation Model Actually Reflects Buildout  
Conditions Under the General Plan.**

I21-92

The General Plan's failure to specifically describe the location, type and intensity of development that would occur on all of the County's lands in 2030 results in significant flaws in the RDEIR's purported evaluation of transportation impacts. Rather than use a land use-based approach to transportation impact analysis, the RDEIR relies on a regional travel demand forecast model created by the Tulare County Association of Governments ("TCAG") that uses population and employment projections to generate traffic data. RDEIR at 3.2-21.

Unfortunately, the RDEIR contains no detail about the modeling assumptions other than vague statements such as the following: the TCAG model "contains many socioeconomic data attributes including information related to number of households and number of employees per traffic analysis zone" (*Id.*) and "[i]mplementation of the proposed project *would result in additional Countywide residential and non-residential land use developments*, with many [sic] of the resulting population growth contributing additional vehicle uses on local and regional streets and highways within all of the County's individual planning areas" (at 3.2-26 (emphasis added)).

Given these vague and generic statements and the lack of any descriptive land use information or trip generation estimates, it is not possible to determine if the traffic model uses the same population and employment assumptions as the draft General Plan itself or if and how it considers the General Plan's land use designations. In other words, there is no evidence that the transportation model is actually analyzing the impacts of the General Plan rather than some other scenario.

Moreover, even if the model's population and employment assumptions are consistent with the General Plan's, such statistics alone do not provide sufficient information to determine how the County's roadway network would operate under the proposed General Plan. Specificity regarding the Plan's land use component (i.e., the location and distribution of land uses) is critical to evaluating transportation impacts. As the RDEIR states, "transportation and circulation needs are closely tied to the location and distribution of land uses." RDEIR at 3.2-21.

The County's failure to actually analyze the transportation impacts from the General Plan was a critical flaw in the original 2008 DEIR and remains a flaw in the RDEIR. This is essentially a matter of common sense—to understand transportation

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 41

impacts, one must know where people live and work and how they will travel between the two. Thus, the RDEIR should have used the General Plan's land use designations as the basis for evaluating its transportation impacts. But because the General Plan does not include a comprehensible land use plan, the RDEIR could not do so.

I21-92  
cont'd

In general, transportation impact analyses for development projects—including general plans—follow a fairly routine formula: First, land use locations, densities and intensities must be assigned. This is the key missing step in the present General Plan and RDEIR. As described above, in many instances, the proposed General Plan is essentially a free-for-all since the County assigns a mixed use land use designation to all of the County planning areas that do not have adopted plans. Yet the County has not even disclosed the acreages of the planning areas. Without this fundamental information, it is not possible to even guess at the holding capacity of the County's myriad planning areas. As discussed above, the RDEIR must provide this information and also assume full buildout at the maximum density available in each part of the County. This will provide the needed data about the location of population and employment. Then, trip generation and trip distribution data should be attributed to each land use; these data will then be combined with background transportation data (e.g., existing roadway and intersection traffic volumes, level of service and public transit service statistics); and, based on these components, the RDEIR can estimate the General Plan's impact on the transportation system.

To make matters worse, the RDEIR concludes that deterioration in the County's traffic level of service standards is largely unavoidable "mostly due to city growth not directly controlled by this plan." RDEIR at 3.2-21. Yet, because the RDEIR provides no detail about the County's growth projections—let alone any documentation relating to growth within each of the County's cities—it is simply not reasonable to cast blame on the Cities for any role they may play in traffic congestion on roadways within the County.

I21-93

In sum, the failure of the original DEIR to analyze the transportation impacts of the General Plan was an egregious flaw that warranted supplemental analysis and recirculation of the environmental document. We are perplexed that after two years, the revised traffic analysis suffers from the exact same defect. The County must again revise its traffic analysis and recirculate the environmental document for public review.

I21-94

David Bryant, Project Planner  
May 26, 2010  
Page 42

**(b) The RDEIR Relies on an Inappropriate Baseline for Evaluating the Project's Transportation Effects.**

I21-95

The RDEIR fails to evaluate the General Plan's transportation impacts against an accurate baseline. CEQA case law holds that existing conditions at the time an agency prepares environmental review, rather than some hypothetical future scenario, establish the "baseline" for determining the significance of impacts. *See* CEQA Guidelines § 15125(a); *see also* *Communities for a Better Env't. v. S. Coast Air Quality Mgmt. Dist.* (2010) 48 Cal. 4th 310; *Save Our Peninsula Cmte. v. Monterey County Board of Supervisors* (2001) 87 Cal. App. 4th 99, 125; *Environmental Planning & Information Council v. County of El Dorado* (1982) 131 Cal. App. 3d 350, 354.

Here, the RDEIR attempts to predict 2030 traffic conditions by using a future roadway system, but it is unclear whether the assumed 2030 roadway improvements are part of the Project or mitigation for the Project. As the RDEIR states, "[a] series of model runs were conducted to evaluate the effectiveness of the circulation plan. As a result of this analysis, it was determined that the following roadways (with several outside the immediate jurisdiction of the County) would require future improvements (mitigation in the form of widening, additional lanes, etc.)." RDEIR at 3.2-24. This language is so vague that there is no way for a reader to determine which roadway improvements were actually a part of the traffic modeling and whether they are in the General Plan's Circulation Element as part of the Project or considered as mitigation for the Project.

What exactly is the General Plan's circulation plan and which specific roadway projects are included in this plan? Inasmuch as the RDEIR suggests that the list of roadway improvements is mitigation for the General Plan's impacts, are these improvements a part of the circulation plan or not? Moreover, an improvement that is assumed in the initial analysis of traffic conditions cannot then be counted as a mitigation measure to reduce traffic congestion. In addition, it is entirely unclear whether these roadway projects would be operational by 2030 given the federal, state and local budget crises. *See* General Plan Background Report 5-26 through 5-36, which painstakingly describes the "bleak" transportation funding picture facing Tulare County. To complicate matters further, the RDEIR states:

I21-96

[M]ost of the roadway infrastructure improvements identified are on facilities under the jurisdiction of entities outside the County (such as Caltrans or the City of Visalia, etc.). Therefore, implementation of the proposed improvements would be subject to approval by other agencies, as well as to funding programs that are not fully developed at this time. Timely

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 43

construction of the proposed improvements would require substantial coordination and cooperation between the county and other agencies.

I21-96  
cont'd

RDEIR at 3.2-31. Again, are these roadway infrastructure improvements part of the General Plan's Circulation Element? And given the fact that certain of the improvements are outside the County's jurisdiction (the RDEIR never actually tells us which improvements are within and which are outside the County's jurisdiction), the County has even less certainty and assurance that the roadway improvements would be undertaken by 2030. All of these outstanding questions also implicate the failure of the RDEIR to adequately describe the proposed Project.

If the RDEIR's traffic analysis does, in fact, assume the existence of roadway projects that may not be built within the General Plan's 2030 horizon, then the General Plan is likely to result in transportation impacts far more severe than the RDEIR discloses. In order to understand exactly how the County's roadways and freeways would operate upon implementation of the General Plan, the revised RDEIR must conduct two separate analyses. First, the RDEIR should evaluate the traffic that would be generated by General Plan buildout against existing conditions (i.e., the 2010 roadway network). Second, the RDEIR should evaluate the traffic that would be generated by General Plan buildout against a 2030 roadway system. Yet, as regards this latter analysis, only those transportation improvement projects that are programmed and that have a high likelihood of funding, and consequently a high likelihood for full implementation by 2030, should be included in the transportation model in order to provide a realistic evaluation of future traffic impacts.

I21-97

Finally, this revised traffic analysis must distinguish the traffic that would be generated by the County's growth from that which would be generated by other jurisdictions. As discussed above, the RDEIR suggests that the deterioration in the County's traffic level of service standards is largely unavoidable mostly due to city growth not directly controlled by this Plan. RDEIR at 3.2-21. This statement all but confirms that the County has not yet performed the necessary analyses to determine the amount of trips that would be generated by the proposed General Plan and the effect these trips would have on the operation of roadways in the County. Again, the purpose of an EIR is to analyze the impacts of the project at hand.

I21-98

**(c) The RDEIR Fails to Analyze the Project's Impact on Freeway Interchanges.**

I21-99

The RDEIR fails to include *any* analysis of the General Plan's impact on freeway interchanges claiming that such an analysis is "too specific for a general plan."

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 44

RDEIR at 3.2-25. This omission is particularly troublesome especially because—as the County itself recognizes—“no single design feature has a greater impact on the urban corridor than the interchange.” *See* General Plan Background Report at 5-16. Certain interchanges such as those along State Route 99 “are antiquated, have capacity problems, and subsequently safety hazards associated with them.” *Id.* at 5-17. While the General Plan identifies several interchange improvement projects and lists target dates for when these projects may be constructed (Background Report at 5-18 and Table 5-4), this information is not sufficient for purposes of CEQA review.

I21-99  
cont'd

Contrary to the RDEIR’s bold assertion that it is not required to conduct an analysis of freeway interchange impacts, it is precisely the purpose of this RDEIR to analyze the environmental consequences of General Plan buildout. If traffic from the General Plan would affect interchanges—and of course it will—then the RDEIR must analyze these impacts. As discussed above, the RDEIR must clearly document and justify transportation planning assumptions. Only those interchange improvement projects that are programmed and that have a high likelihood of funding, and consequently a high likelihood for full implementation by 2030, should be included in the analysis.

**(d) The RDEIR Underestimates Traffic Impacts by Failing to Analyze Traffic Impacts During Peak Periods and by Ignoring Traffic Impacts on Intersections.**

I21-100

The RDEIR understates the General Plan’s traffic impacts because it uses an inappropriate methodology to evaluate traffic conditions. Specifically, the RDEIR’s level of service (“LOS”) analysis was conducted only for average daily traffic (“ADT”), rather than peak hour or peak period traffic. LOS is typically measured during the weekday a.m. or p.m. peak period or peak hour; that is, the heaviest travel time of any given day. This is the most accurate measure of traffic conditions because congestion generally occurs during morning and evening commute periods, not during the middle of the day. *See* General Plan at I-13-1. Averaging traffic volumes over an entire day could smooth out very high peak volumes. This would then give the impression that the roadway suffered no traffic problems, when in fact there was significant congestion and vehicular delay during commute times.

The RDEIR’s approach of calculating LOS based on ADT understates the true effects of development under the General Plan. CEQA requires that the analysis of periodic impacts, like traffic or noise, account for the peak periods of impact, rather than submerging them in an average. *See Berkeley Keep Jets Over the Bay Committee v.*

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 45

*Board of Port Comrs.* (2001) 91 Cal. App. 4th 1344, 1355 (requiring the analysis of single-event noise levels) (“*Berkeley Jets*”).

I21-100  
cont'd

The flaws in the traffic analysis methodology extend beyond its failure to evaluate peak hour or peak period traffic congestion. The RDEIR’s LOS analysis was conducted for roadway segments rather than intersections. While it may be helpful to understand how roadway segments operate, the critical measure of a roadway’s capacity is the capacity of its intersections. Intersections, and not roadway segments, are the choke points in a roadway network. While a roadway segment may operate at LOS D, intersections along that same roadway may operate at LOS E or F.

I21-101

As the General Plan itself recognizes, “[o]perational analyses typically focus on intersections rather than road segments since the capacity of the intersections is usually more critical than the capacity of the roadway.” General Plan at I-13-1. Inasmuch as the Plan prescribes LOS standards for both roadway segments and intersections in Policy TC-1.16, it is therefore difficult to fathom why the RDEIR ignores this crucial category of impact. “An EIR must identify and evaluate *all* significant environmental effects of a project.” *Citizens to Preserve the Ojai v. County of Ventura* (1985) 176 Cal. App. 3d 421, 428 (emphasis added) (citation omitted). The RDEIR, by failing to consider intersection impacts, has failed to live up to this charge. Had the RDEIR analyzed peak period intersection LOS, the Project’s traffic impacts would certainly be more severe than the RDEIR discloses. See RDEIR at 3.2-24, 25 and Table 3.2-7.

**(e) The RDEIR Fails to Analyze and Mitigate the Project’s Impact on Transit Service.**

I21-102

The proposed General Plan encourages development on the outskirts of the County’s cities. Although this increase in development would result in an increase in transit demand within the Cities, the RDEIR fails to analyze or mitigate these impacts. Instead, the document casually asserts that “as new population growth occurs and transit demand increases, additional transit services will be developed to ensure that adequate supply exists. Largely market driven, transit service will expand as needed and will be self mitigating.” RDEIR at 3.2-26. Because the RDEIR fails to provide even the most rudimentary analysis of the Project’s impact on increased transit demand within the Cities, it fails to meet CEQA’s clear requirements.

The RDEIR also fails to recognize the General Plan’s sprawling low density land use patterns would severely hamper the region’s efforts to sustain and expand transit service within the County. One of the challenges of justifying

I21-103

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 46

development of urban transit systems (bus, rapid bus, and light rail) both from a practical and financial standpoint, is that there must be urban densities to support the systems. Those densities should occur within City UDBs within the Cities. In other words, properties must develop at sufficiently high densities within the City UDBs to ensure the feasibility of transit. TCAG has completed a light rail study for a transit system between the Cities of Tulare and Visalia confirming that in the absence of such high density land uses, there is simply no potential for a viable transit system. (Olmos, 2010). The revised EIR must analyze these transit-related impacts and identify feasible mitigation measures.

I21-103

**(f) The RDEIR Fails Altogether to Analyze the General Plan's Impact on Pavement Conditions.**

I21-104

Road condition is an important factor in the overall capacity and operational characteristics of the County's roadway system. *See* RDEIR at 3.2-7 and General Plan Background Report at 5-21 and 5-39 through 5-43. The General Plan explains that due to a significant reduction of available funding for road maintenance over the past two decades, the County has not been able to adequately maintain its roadway system. *Id.* at 5-39. The County's roads are deteriorating at an accelerated rate and many roads have large potholes, alligator cracking and deteriorating asphalt. *Id.* Much of this deterioration is attributed to the steady increase of truck and commodity growth in the County. *Id.* While 30 years ago there were 150,000 trucks with 4,000,000 in tonnage; now there are 550,000 trucks with 14,000,000 in tonnage. *Id.* at 5-41. The issue of roadway deterioration is critical for the agricultural industry that uses these roads for farm-to-market trips and also significantly contributes to road deterioration. *Id.* at 5-39.

With as much detail as the General Plan presents with regard to this critical transportation issue, one would expect the RDEIR to have provided a thorough analysis of the General Plan's effect on pavement deterioration. Yet, this is not the case. Although the RDEIR's environmental setting section acknowledges the importance of road conditions, and particularly deteriorating roads that are narrow or do not have adequate shoulders (at 3.2-7), the document fails to provide *any* evaluation as to how this condition affects roadway capacity. More importantly, the RDEIR fails to evaluate the effect that the increase in automobile and truck travel that would result from implementation of the General Plan would have on roadway conditions within the County. The RDEIR must be revised to analyze and mitigate this significant impact.

SHUTE, MIHALY  
& WEINBERGER LLP

May 26, 2010  
Page 47

**(g) The RDEIR Fails to Include Feasible Mitigation Measures for the General Plan's Transportation Impacts.**

I21-105

The RDEIR comes to the conclusion that no mitigation measures, other than the proposed General Plan's policies, are available to reduce the transportation impacts that would result from implementation of the General Plan. RDEIR at 3.2-31. The RDEIR's approach to mitigation fails in three substantive ways: (1) the General Plan policies would not effectively reduce Project impacts; (2) other feasible mitigation exists that would further reduce Project impacts; and (3) the RDEIR fails to actually analyze the effect the policies would have on roadways. Thus the public and decisionmakers are left in the dark as to which roadways will operate under unacceptable conditions in 2030.

**(i) The General Plan Policies Would Not Effectively Reduce Project Impacts.**

I21-106

The RDEIR determines that the General Plan would result in significant traffic impacts. RDEIR at 3.2-26. CEQA therefore, requires the identification of mitigation measures to avoid or minimize those impacts. *See* CEQA Guidelines 15126.4(a). The RDEIR relies on certain General Plan policies and implementation measures as mitigation to minimize the impacts but concludes that these measures could not, in fact, reduce them to a less than significant level. RDEIR at 3.2-32. Yet, these measures fail to reduce traffic impacts because, among other reasons, they are too vague and are otherwise unenforceable.

CEQA requires that "mitigation measures proposed in an EIR must be "fully enforceable" through permit conditions, agreements, or other legally binding instruments." CEQA § 21081.6(b); CEQA Guidelines § 15126.4(a)(3). Uncertain, vague, and speculative mitigation measures have been held inadequate because they lack a commitment to enforcement. *See, e.g., Anderson First Coalition v. City of Anderson* (2005) 130 Cal. App. 4th 1173, 1188-89 (holding traffic mitigation fee measure inadequate under CEQA due to vagueness in program for implementing required improvements). The policies identified as traffic mitigation do not meet these standards.

For example, the measures call for the County to maintain a public road network (TC-1.1), continue to work with other agencies to assess transportation needs (TC-1.3), work to enhance funding (TC-1.4), and give priority to roadway maintenance to maintain integrity of roadways (TC-1.5). The first two of these policies are utterly vague and do nothing to actually reduce the traffic congestion impacts identified in the RDEIR. The second two might improve congestion problems, if the County actually takes the proposed action, but the policies are in no way binding or enforceable, and thus may not

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 48

be relied upon as effective mitigation. The purpose of mitigation is to reduce the severity of an environmental impact; the cited General Plan policies do little more than state the County's interest in reducing traffic impacts. Setting goals is important, but it is no substitute for actually imposing effective mitigation measures.

I21-106  
cont'd

The County cannot use the RDEIR's failure to incorporate adequate, enforceable, feasible mitigation measures into General Plan policies to justify the RDEIR's conclusions that the Project's impacts are unavoidable; to the contrary, if the RDEIR had proposed and analyzed adequate mitigation measures—as required under CEQA—some of those impacts might have been avoided. In order to do this job, the General Plan policies must be revised to make them mandatory and legally binding.

Moreover, to the extent the RDEIR claims that the General Plan policies and implementation measures would minimize the Project's significant effects on the 13 roadway segments that would operate at deficient service levels in 2030 (RDEIR at 3.2-31), the document must provide some evidentiary support for this conclusion. The RDEIR lacks any quantitative traffic operations analysis with respect to implementation of the proposed policies, implementation measures or the other roadway projects that may be implemented to reduce impacts. Thus the public and decisionmakers have no idea what effect, if any, this "mitigation" will have on service levels. In essence, then, the RDEIR fails to provide a single meaningful action to mitigate the significant impacts associated with the proposed General Plan. Instead, each of the 13 significantly impacted segments (which are disingenuously grouped together as a single impact) are left "significant and unavoidable." This approach ignores the fact that measures could certainly be implemented, or the General Plan itself could be redesigned, to resolve some of the impacts. The bottom line, however, is that the public and decisionmakers are left in the dark as to exactly what effect the General Plan would have on the area's roads.

I21-107

This deficiency is particularly egregious in terms of the Project's extensive impacts on the Cities' transportation systems. Because the proposed General Plan encourages substantial growth throughout the County and within the Cities' planning boundaries, the increased traffic from this development would place vast demands on the Cities' transportation networks. Yet, the RDEIR's superficial approach to impact analysis fails entirely to present mitigation that would ensure the Cities are sufficiently protected from this onslaught of traffic.

I21-108

(ii) **Feasible Mitigation Exists and Should Be Adopted.**

I21-109

CEQA requires that an EIR identify, and the decisionmaker adopt, all feasible mitigation measures that would reduce or avoid a project's significant impacts.

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 49

CEQA § 21002; CEQA Guidelines § 15091(a)(3). The agency must comply with this requirement even if the mitigation would not reduce the impact to a less than significant level, as long as the measure would have some mitigating effect. The best way to mitigate the General Plan's traffic impacts would be to reduce both the total number of vehicle trips and the average trip length. The most efficient way to reduce vehicle trips and trip length is to control sprawling growth patterns.

I21-109  
cont'd

Decentralized development, such as that proposed in the General Plan, separates homes from other land uses, requiring automotive transportation for most or all trips. In addition, low density, scattered development lacks the economies of scale necessary to make public transit effective and economical. Residents of cities, on the other hand, often have substantially reduced vehicle dependency. Municipal development often has higher density, mixed use communities. People tend to be closer to jobs and shopping, sometimes within walking or bicycling distance. Transit service also tends to be higher frequency and more reliable in cities in comparison to lower density unincorporated communities. If people choose to use a car in cities, trips are short. The U.S. Environmental Protection Agency ("EPA") modeled the transportation and environmental impacts of locating the same development on two sites—one infill, and one suburban edge/greenfield—and compared the results. The modeling predicted that the infill site would outperform the greenfield site in six important dimensions:

- Average trip distance: generally shorter with the infill site.
- Per capita vehicle miles traveled: generally fewer with the infill site.
- Travel time: generally shorter with the infill site.
- Public infrastructure and household travel costs: lower with the infill site.
- Environmental impacts, including emissions: smaller with the infill site.
- Multi-modal orientation and access to community amenities and transportation choices: greater at the infill site.

See "The Transportation and Environmental Impacts of Infill Versus Greenfield Development: A Comparative Case Study Analysis," Hagler Bailey Services (prepared for U.S.EPA), October 1999, excerpts attached as Exhibit 14. The EPA study concluded that city-based development can produce non-trivial transportation, environmental, and public infrastructure cost benefits. *Id.*

Consequently, in addition to revisions to the General Plan's policies that would control sprawling growth patterns, the County should evaluate measures to ensure that it is taking all available means to ensure that County inhabitants travel less. To this end, the revised RDEIR should include a list of alternative transportation strategies.

I21-110

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 50

Specifically, the RDEIR must evaluate project and community design standards and techniques that achieve the following objectives:

I21-110  
cont'd

- Reducing commute distances and commute times;
- Reducing automobile use, especially single-occupant vehicle automobile trips; and
- Encouraging and supporting the use of transit.

Moreover, as explained above, traffic impacts are intimately tied to land use patterns. Once the traffic analysis in the RDEIR has been revised to analyze the land use types and locations called for in the General Plan, that analysis can be used to re-examine the General Plan's land use policies. For example, if, as seems likely, it turns out that the RDEIR projects that significant amounts of traffic will come from commutes between residences in unincorporated areas to jobs in cities, then the General Plan could be revised to mitigate this traffic by shifting residential growth inside municipal boundaries and closer to jobs.

I21-111

**4. The RDEIR Fails to Adequately Analyze and Mitigate the General Plan's Air Qualities Impacts.**

I21-112

**(a) The RDEIR's Analysis of the General Plan's Impacts From Stationary and Area Sources Is Deficient.**

The southern San Joaquin Valley, including Tulare County, suffers from some of the nation's worst air quality. By its own admission, implementation of the General Plan would cause a substantial increase in air pollution. RDEIR at 3.3-18. The RDEIR, however, fails to actually analyze the health effects that would occur as a result of exposure to these pollutants.

While the RDEIR's air quality analysis contains extensive flaws, we summarize just a few of the most egregious deficiencies below. We suggest that the County follow closely the San Joaquin Valley Air Pollution Control District's ("SJVAPCD") Guide for Assessing and Mitigation Air Quality Impacts ("GAMAQI"). This Guide, produced by the agency with the most extensive expertise in Valley air issues, sets the standard for effective, useful analysis of the emissions produced by projects and plans in this region.

The RDEIR's analysis of air quality impacts is crippled by the same flaws that afflict the rest of this document: because the General Plan does not provide a comprehensible description of the distribution of proposed land uses throughout the County, the RDEIR does not analyze the environmental consequences of such land uses.

I21-113

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 51

The air quality analysis, like the traffic analysis discussed above, relies on the TCAG traffic model. Because of the RDEIR's failure to explain the model's assumptions, it is impossible to determine whether the model accurately reflects the General Plan. The RDEIR includes vague and uninformative statements that all but confirm that the air quality analysis is not based on the actual land use assumptions of the proposed General Plan. (See e.g., RDEIR at 3.3-24: "[t]his analysis assumes that growth in population, vehicle use and other source categories will occur at historically robust rates."). An analysis of the General Plan's environmental impacts should necessarily be based on the emissions generated by stationary and mobile sources from projected development levels, not historical growth rates. Moreover, from the limited information included in the RDEIR, it is evident that the estimate of air emissions omits or underestimates several sources of pollutants.

I21-113  
cont'd

While the initial 2008 DEIR stated that development under the General Plan would introduce a variety of new stationary and area sources of emissions to the County, including facilities that use natural gas, landscape maintenance equipment, and woodburning stoves, as well as a variety of industrial and commercial processes (DEIR at 4-50), the RDEIR does not include woodburning stoves or landscape maintenance equipment in its emission inventory. See RDEIR at 3.4-20, 21. The failure to include these sources consequently results in an underestimation of the Project's air quality impacts. See *Id.*, Table 3.3-5. Unless and until the RDEIR is revised to account for the whole of the General Plan's increase in emissions, it will remain inadequate.

I21-114

The RDEIR's conclusions regarding projected vehicular emissions levels are undermined by its reliance on the TCAG model and on an assumed reduction in per-car tailpipe emissions, sufficient to overcome the increased driving due to population growth. RDEIR at Table 3.3-5, footnote b. Although vehicles are getting cleaner, the RDEIR's conclusion that overall vehicular emissions will decrease between 2007 and 2030 is wholly insupportable in the absence of evidence regarding land use patterns. Studies show that growth in driving is likely to cancel out improved vehicle fuel economy:

I21-115

If sprawling development continues to fuel growth in driving, the projected 48 percent increase in the total miles driven between 2005 and 2030 will overwhelm expected gains from vehicle efficiency and low-carbon fuels. Even if the most stringent fuel-efficiency proposals under consideration are enacted, [ ] "vehicle emissions still would be 34 percent above 1990 levels in 2030 – entirely off-track from reductions of 60-80 percent below 1990 levels by 2050 required for climate protection."

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 52

See "Growing Cooler: Evidence on Urban Development Change," Executive Summary, attached as Exhibit 15.

I21-115  
cont'd

If future growth occurs in a pattern that encourages more driving than the TCAG model assumes, then the RDEIR's conclusions are entirely wrong. Without information about the correlation between the transportation model and the development patterns under the General Plan, one cannot assess whether the reduction in vehicular emissions will indeed compensate for the increased in vehicle miles travelled. Thus the RDEIR is not supported by the substantial evidence that CEQA requires.

The RDEIR's analysis of those emissions sources that it does identify is also flawed. First, it lacks support for its quantification of the increase in emissions from dairy and feedstock facilities. The RDEIR explains that dairy and feedstock emissions were estimated in the Tulare County Draft Phase I Animal Confinement Facilities Plan Supplemental EIR ("ACF EIR"), which assumed buildout by the year 2020. RDEIR at 3.3-17 and Table 3.3-5. The planning horizon for the Tulare County General Plan, however, extends to 2030. The RDEIR does not disclose its methodology for determining the dairy-related emission estimates for the ten years between 2020 and 2030, and thus lacks substantial evidence in support of its determinations.

I21-116

In addition, the ACF EIR cannot support the RDEIR's conclusion, even for the time up to 2020. First, it is inappropriate to rely upon this type of incorporation by reference as substitute for an important analysis of a key environmental impact. "Incorporation by reference is most appropriate for including long, descriptive, or technical materials that . . . do not contribute directly to the analysis of the problem at hand." CEQA Guidelines § 15150(f). Clearly the analysis of emissions from dairy and other livestock facilities "contributes directly" to the analysis of the General Plan's air quality impacts, and therefore should have been included directly in the text of the RDEIR, not merely incorporated by reference. Moreover, even if the RDEIR could legitimately rely upon an outside document for its analysis and conclusions, it would need to include a thorough description of the ACF EIR's scope and methodology. See *Emmington v. Solano County* (1987) 195 Cal. App. 3d 491, 502-03 (outside reports do not support environmental document where they are not adequately summarized and analyzed).

I21-117

CEQA also requires that an agency relying on an EIR prepared for a different project or program must comply with specific procedures, including notifying the public about where a copy of the previous EIR can be obtained. CEQA § 21094(e); CEQA Guidelines §§ 15152 & 15153. The RDEIR contains no such information about

I21-118

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 53

the ACF EIR. As a result, the County cannot rely on that EIR in analyzing the Project's impacts.

I21-118  
cont'd

In order to provide the public and decisionmakers with the information required by CEQA, the RDEIR must identify 2030 ROG, NO<sub>x</sub> and CO emissions with and without the General Plan. In other words, the RDEIR must provide the absolute increase in all stationary and mobile source emissions from 2010 to 2030.<sup>7</sup> Decisionmakers must understand the full range of transportation and air quality assumptions if they are truly to understand the General Plan's impact on the region's air quality.

I21-119

**(b) The RDEIR Fails to Adequately Analyze Impacts Relating to the Project's Effect on the Regional Air Quality Plan.**

I21-120

Rather than analyze how the General Plan's increase in air emissions would affect the SJVAPCD air quality plan, the RDEIR generally asserts that the General Plan was designed specifically to achieve and promote consistency with the planning documents of neighboring jurisdictions and other agencies that have jurisdiction over the project. RDEIR at 3.3-23. The RDEIR then relies upon a series of General Plan policies to conclude that impacts relating to the General Plan's consistency with the regional air quality plan would be less than significant. *Id.* at 3.3-23, 24. CEQA requires more than this cavalier approach to impact analysis.

To give just one example, ROG emissions from dairy and feedlot operations alone would be 2,570 tons per year, while the SJVAPCD standard is 10 tons. RDEIR at Table 3.3-5. Under the General Plan, emissions from just this one category of source would exceed the applicable standard by more than 250 times. Rather than seriously grapple with the effect the Project would have on the region's air quality plan, the RDEIR simply asserts that "the amount of growth predicted . . . could make it more difficult to attain [ ] the standards" and "the potential that a significant impact could

<sup>7</sup> Moreover, because the RDEIR identifies only year 2030 emissions, it does not accurately assess impacts in the middle of the General Plan's buildout period (i.e., 2015 or 2020). The SJVAPCD recommends an interim year analysis: "[i]f a project has over a five year projected build-out, analyses should be done for the final build-out year (using the nearest default year in URBEMIS) and one intermediate year (using the URBEMIS default year nearest to the midpoint of projected build-out of the project)." SJVAPCD GAMAQI at 40. Consequently, the RDEIR should be revised to provide an interim year analysis.

I21-121

David Bryant, Project Planner  
May 26, 2010  
Page 54

occur remains a possibility.” *Id.* at 3.3-24, 25. These obvious, generic statements do not come close to meeting CEQA’s requirements for a detailed impact analysis. A legally adequate EIR “must contain sufficient detail to help ensure the integrity of the process of decision making by precluding stubborn problems or serious criticism from being swept under the rug.” *Kings County Farm Bureau*, 221 Cal. App. 3d at 733; CEQA Guidelines § 15151.

I21-120  
cont'd

The RDEIR must thoroughly disclose the implications on the region’s air quality plan. Would implementation of the General Plan push compliance with the air quality standards back by one year, five years, or ten years? What would be the health implications for the region’s residents? Simply concluding that the General Plan may conflict with the air quality plan does not allow decisionmakers to evaluate whether implementation of the proposed Project is worth a potentially extensive delay in achieving attainment of health-based air quality standards. The revised EIR must explain the actual and specific implications associated with the region’s failure to attain the state and federal standards for each of the pollutants for which the region is in non-attainment of the standards.

I21-122

**(c) The RDEIR Fails to Analyze Impacts Relating to PM<sub>2.5</sub> Emissions.**

I21-123

The federal Clean Air Act requires all states to attain the 1997 standards for the particulate pollutant known as PM<sub>2.5</sub> as expeditiously as practicable beginning in 2010, but no later than April 5, 2015. *See* SJVAPCD Proposed PM<sub>2.5</sub> Plan. Buildout of the County’s General Plan would result in 759 tons per year of PM<sub>2.5</sub>.<sup>8</sup> The RDEIR, however, fails to determine either whether the Project’s substantial increase in PM<sub>2.5</sub> emissions would be a significant contribution to the region’s already significant PM<sub>2.5</sub> problem, or whether it would conflict with or obstruct implementation of the SJVAPCD

<sup>8</sup> The original 2008 DEIR determined that the General Plan would result in an additional 2,264 tons per year of PM<sub>2.5</sub>. The RDEIR does not explain why its PM<sub>2.5</sub> emission estimates have been reduced so substantially in comparison to the previous environmental document. The RDEIR must provide an explanation for this reduction, especially because the County has a high number of dairies and feedlots which emit high levels of ammonia. Ammonia is a precursor to PM<sub>2.5</sub> (RDEIR at 3.3-26). There is no indication that the County intends to substantially reduce the number of dairies/feedlots in 2030. Consequently, it is counter-intuitive that PM<sub>2.5</sub> emissions would have dropped so substantially since the last version of the EIR.

I21-124

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 55

plan. The revised EIR must undertake this analysis and identify mitigation measures capable of eliminating or reducing this impact. The SJVAPCD has prepared a comprehensive and exhaustive list of strict regulatory and incentive-based measures to reduce PM<sub>2.5</sub> and precursor emissions throughout the Valley. *Id.* at ES-2. In addition to including these measures as mitigation, the revised EIR should consider measures to reduce particulate emissions from mobile sources, which are beyond the District's direct jurisdiction. *Id.* at ES-3.

I21-123  
cont'd

**(d) The RDEIR Fails to Analyze Adequately the Project's Potential to Expose Sensitive Receptors to Substantial Pollutant Concentrations.**

I21-125

The RDEIR makes no attempt to quantify the increase in toxic air contaminants ("TAC") from buildout of the General Plan; instead it defers this analysis, suggesting that these emissions can be controlled at the local and regional level through permitting. RDEIR at 3.3-21. CEQA does not allow an EIR to defer analysis and mitigation to a future time. *Sundstrom v. Mendocino County* (1988) 202 Cal. App. 3d 296. A project's impacts must be analyzed, disclosed, and mitigated at the "earliest feasible stage in the planning process." *Id.* at 307; *see also* CEQA Guidelines § 15126.4(a)(1)(B) ("Formulation of mitigation measures should not be deferred until some future time."); *Communities for a Better Env't. v. City of Richmond*, 2010 WL 1645906 at \*14; *Gentry v. City of Murieta* (1995) 36 Cal. App. 4th 1359, 1396. Consequently, the RDEIR must evaluate the increase in TAC emissions that would result from implementation of the General Plan.

The RDEIR also fails to evaluate the health risk to sensitive receptors resulting from exposure to TAC emissions. Although the RDEIR acknowledges that sensitive land uses near local roadways, for example, could be exposed to air pollutant emissions (RDEIR at 3.3-25), the document stops short of actually analyzing this very serious potential public health impact. This failure, of course, is due largely to the General Plan's lack of a comprehensible land use plan. The lack of specific information regarding the distribution of different land uses hampers the RDEIR's ability to discern where sensitive receptors and TAC-generators might come together. The RDEIR should have identified locations at particularly high risk from TAC exposure (e.g., areas along major roadways, rail activity areas, areas near dairy and feedlot operations) and, in mitigation, required any necessary modifications to the County's proposed land use plan, such as the creation of sufficient buffer areas and contingency plans.

The RDEIR's failure to provide this analysis is particularly disturbing since the California Air Resources Board ("CARB") provides guidance pertaining to TACs and

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 56

land use development. As the RDEIR acknowledges, CARB's Air Quality and Land Use Handbook ("CARB Handbook") is intended to provide guidance to agencies when considering the potential risks to sensitive receptors (e.g., schools, homes, daycare centers, medical facilities) from TAC exposures. *See* RDEIR at 3.3-26. Land uses that result in such exposures, particularly exposure to combustion-related diesel particulate matter ("DPM"), are rarely required to acquire air quality permits. Therefore, lead agencies, such as the County, must take action to prevent or minimize health risk exposure, and cannot rely on future permitting, as the RDEIR has attempted to do.

121-125  
cont'd

Indeed, the CARB Handbook explains that the *primary purpose of General Plans*, and the source of government authority to engage in planning, is to protect public health, safety and welfare. CARB Handbook at 41 (emphasis added). CARB highlights the potential health impacts associated with proximity to TAC sources, and offers guidance and setback distances for a number of land use types commonly associated with TAC emissions. CARB guidance states that "[b]ecause living or going to school too close to such air pollution sources may increase both cancer and non-cancer health risks, we are recommending that proximity be considered in the siting of new sensitive land uses." *Id.* at ES-1. The Guidance further states "what we know today indicates that keeping new homes and other sensitive land uses from siting too close to such facilities would provide additional health protection." *Id.*

Clearly, sound planning principles, along with CEQA's bar on deferred analysis, dictate that the appropriate context for addressing and eliminating these land use conflicts is during a comprehensive update of the General Plan, not at the project-specific level. The General Plan RDEIR should have used this CARB guidance—both to evaluate the potential health risk associated with implementation of the General Plan and to determine feasible alternative land use patterns if health risks would be elevated as a result of the proximity of sensitive receptors to toxic sources.

**(e) The RDEIR Fails to Adequately Analyze the Potential for Development Under the General Plan to Create Objectionable Odors.**

121-126

Dairies and feedlots have the potential to generate odors and to impact nearby sensitive receptors. Despite this fact, the RDEIR devotes exactly three sentences to this important issue. Moreover, this cursory discussion omits any actual analysis of how sources of odorous emissions caused by implementation of the General Plan would impact sensitive receptors. Again, the RDEIR defers this important analysis and concludes, absent any evidence, that impacts relating to odorous emissions would be less than significant. RDEIR at 3.3-28. The RDEIR can hardly conclude that no sensitive

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 57

receptors will be affected by dairy or feedlot odors if there is no plan to ensure that such receptors will not be located near the odor sources.

I21-126  
cont'd

The purpose of the General Plan is to guide the growth and development of the County. Locating adequate sites for dairy and feedlot development will become more difficult upon buildout of the County. Sensitive land uses must be protected from these incompatible uses. Had the County prepared its General Plan in a manner that outlined present land uses and provided a comprehensible description of the distribution of proposed land uses, the RDEIR would then be able to evaluate these potential impacts. Under the General Plan as currently proposed, with its lack both of a legally adequate land use plan and of effective policies to avoid odor-related land use conflicts, the RDEIR must assume that the County is built out to the maximum density allowable. It must then estimate how many sensitive receptors are likely to be located within an affected area of odor-producing facilities. This calculation will allow the determination of the severity of the impact, which is likely to be significant.

**(f) The RDEIR Fails to Identify Feasible Mitigation Measures for the General Plan's Significant Air Quality Impacts.**

I21-127

The RDEIR fails entirely to identify adequate mitigation for the General Plan's significant air quality impacts. For example, as regards the potential for the General Plan to expose sensitive receptors to sources that generate TACs and offensive odors, the RDEIR looks to policies AQ-3.1 to AQ-3.6, claiming that these policies will "address a variety of nuisance issues." *Id* at 3.3-28. Yet, these policies have no relationship to the specific impact. For example, the policies call for: (1) placing employee services near employment centers; (2) adding landscaping to projects and roadway medians; and (3) promoting energy conservation. *See* General Plan at I-9-9. The RDEIR fares no better when it relies on land use policies LU-1.1, LU-1.4 and LU-1.8. *Id*. These policies, which call for "smart growth" and infill development, will have little, if any effect, on impacts resulting from siting polluting industries near sensitive receptors. *Id*. Clearly, the RDEIR authors must dig deeper to develop measures to mitigate these serious air quality impacts.

As for the General Plan's increase in mobile sources of emissions, the RDEIR relies on mitigation measures that are vague and otherwise unenforceable. AQ-1.1, AQ-1.7, and AQ-2.1 call for nothing more than cooperation and support with other agencies, while AQ-2.3 calls for the County to simply study transportation methods, and AQ-2.4 calls for the County to "encourage . . . participation" in programs. (*See* General Plan at I-9-7, I-9-8). These policies would fail to bring about *any* measurable reduction

I21-128

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 58

in General Plan-related vehicular emissions. On the other hand, the mitigation measures identified above in connection with transportation impacts would, if implemented, result in a substantial reduction in pollutant emissions. CEQA therefore requires this RDEIR to identify such measures before the General Plan may be approved.

I21-128  
cont'd

**(g) The RDEIR Fails to Analyze or Mitigate the Project's Cumulative Air Quality Impacts.**

I21-129

The RDEIR lacks an analysis of the General Plan's cumulative air quality impacts. Instead, it looks to the project-specific analysis of impacts and concludes the Project would contribute considerably to a significant and unavoidable air quality impact. RDEIR at 5-8. Yet, as the RDEIR explains, the project-specific analysis did not evaluate air quality from the entire air basin, or even the entire County:

This assessment includes emissions attributable to all unincorporated lands within Tulare County. It does not include emissions associated with incorporated cities within Tulare County. Therefore, unincorporated Tulare County is considered to be the organizational boundary for the assessment.

See RDEIR at 3.3-16.

The revised RDEIR must include an analysis of the General Plan's cumulative air quality impacts. This analysis must necessarily consider emissions from the entire air basin. Once this analysis is undertaken, the County will be in a position to evaluate feasible mitigation measures capable of offsetting the project's contribution to these cumulative air quality impacts.

**5. The RDEIR Fails to Adequately Analyze and Mitigate the General Plan's Climate Change Impacts.**

I21-130

**(a) The RDEIR Fails to Present an Accurate Representation of Climate Change Impacts Caused by the General Plan.**

Like its predecessor, the RDEIR provides insufficient detail regarding methodology and assumptions to determine whether the greenhouse gas ("GHG") analysis actually evaluates the Project's impacts. Here too, the RDEIR relies on TCAG vehicle miles traveled ("VMT") data to arrive at on-road mobile source GHG emissions. RDEIR at 3.4-25. Yet, the document never (1) identifies the actual VMT numbers from TCAG or the draft General Plan or (2) explains the relationship between the proposed General Plan, including the type and location of proposed land uses, and the TCAG data

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 59

to allow the public and decisionmakers to determine whether the RDEIR's emissions estimates reflect the proposed Project.

I21-130  
cont'd

In order to accurately prepare a GHG emissions inventory representative of the proposed Project, the RDEIR should calculate the number of vehicular trips and the overall VMT attributable to development under the General Plan. Yet, the first step to identifying VMT is to identify the location and extent of existing and proposed land uses (residential, commercial, industrial, mixed use, agricultural and open space, and public) for all land within the County. Until this fundamental first step is undertaken, it is simply not possible to calculate changes in VMT and consequently mobile sources of GHG emissions.

While the RDEIR does now include emissions from electricity, natural gas and solid waste, the RDEIR's electricity sector emission estimates provide no information regarding methodology and assumptions as to how the RDEIR authors calculated the emission estimates. Which specific sources were considered in the calculation of electricity GHG emissions? Were GHG emissions from construction activities and operations taken into account? If so, how were the emission estimates arrived at in the absence of detailed land use data?

I21-131

Construction activities, such as site grading and asphalt paving, and the associated use of utility engines and heavy-duty construction vehicles of individual projects related to the General Plan would produce combustion emissions from various sources. During construction of the Project, GHGs would be emitted through the operation of construction equipment and from worker and builder supply vendor vehicles, each of which typically uses fossil-based fuels to operate. The combustion of fossil-based fuels emits GHGs. GHG estimates must be based on residential, commercial and industrial growth and must be calculated assuming some buildout projection (i.e., 1/20th of the total development occurs in each year with equal construction phasing in each year). Here, the RDEIR provides none of this information.

I21-132

Other critical information missing from the RDEIR relating to its electricity-related GHG emissions projections includes the following: (1) the amount of commercial and industrial square footage within the General Plan area; (2) the number of employees in 2030; (3) the number of single-family and multi-family residences allowed by the General Plan in 2030; and (4) the amount of water-related energy use assumptions (conveyance, water treatment, water distribution, and wastewater treatment).

I21-133

The RDEIR appears to ignore agricultural activities as a source of GHG emissions. According to the Yolo County General Plan EIR, agricultural activities

I21-134

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 60

account for the largest source of GHG emissions under existing conditions and account for 40 percent of the total inventory in that County. *See* Yolo County General Plan EIR, April 2009, at 358, excerpts attached as Exhibit 3. The Yolo County General Plan EIR states:

I21-134  
cont'd

Agricultural activities contribute to emissions of greenhouse gases through a variety of processes, including direct emissions from the field (e.g., manure and soil management) in the form of nitrous oxide and methane, and carbon emissions from agricultural equipment and water-pumping systems. The estimates of greenhouse gas emissions related to agricultural activities are based on emissions from equipment exhaust, including harvesting equipment, emissions from fertilizer application and water use. Rice is produced in the northeast part of the county and in portions of the Yolo Bypass Wildlife Area; methane is produced during flooded rice cultivation by the anaerobic (lacking oxygen) decomposition of organic matter in the soil. *Id.*

While the RDEIR accounts for emissions from dairy/feedlots, there is no indication that these emission estimates take into account all other agricultural operations. The revised EIR must provide the necessary details regarding all sources of GHG emissions.

**(b) The General Plan and RDEIR Must Recognize that Uncontrolled, Sprawling Growth Undermines State Greenhouse Gas Reduction Goals.**

I21-135

The RDEIR determines that the substantial increase in GHG emissions that would accompany implementation of the General Plan could conflict with the State's ability to meet the AB 32 goals. RDEIR at 3.4-32. The document correctly identifies this impact as significant. *Id.* Yet the RDEIR is entirely wrong when it concludes that this impact is unavoidable. Tulare County has the ability to create and adopt a General Plan that advances the goals of AB 32 (and SB 375), and this General Plan creates the opportunity to advance a sustainable land use and transportation planning agenda.

As discussed above in the transportation section of the letter, the General Plan and RDEIR must recognize that uncontrolled, sprawling growth undermines the State's GHG reduction goals. Decentralized, low density land use development results in excessive reliance on the private automobile. Thus GHG emissions will continue to rise despite technological advances, because the increase in driving is projected to overwhelm planned improvements in vehicle efficiency.

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 61

Findings from the study entitled “Growing Cooler: The Evidence on Urban Development and Climate Change,” show that “much of the rise in vehicle emissions can be curbed simply by growing in a way that will make it easier for Americans to drive less”—specifically, through compact development that can reduce driving by 20 to 40 percent. *See* Exhibit 15 [Growing Cooler]. Indeed, recognizing the unsustainable growth in driving, the American Association of State Highway and Transportation Officials, representing state departments of transportation, is urging that the growth of vehicle miles traveled *be cut in half*. *Id.* (emphasis added.) Slowing the growth of vehicle miles traveled, especially when many regions including Tulare County are facing substantial increases in population, is a daunting task. However, much of the rise in vehicle emissions can be curbed simply by managing land use in a way that makes it easier for people to drive less. *Id.* The Legislature and the people of California have decided that this state must move toward sustainable growth. Tulare County’s insistence on working against this goal is unjustifiable.

I21-135  
cont'd

**(c) The RDEIR’s Approach to Climate Change Mitigation Is Utterly Deficient.**

I21-136

The County takes a step in the right direction by preparing a Climate Action Plan (“CAP”) as an implementation measure to reduce the substantial increase in GHG emissions that would accompany implementation of the General Plan. Yet the CAP appears to include identical policies as the General Plan’s air quality chapter of the Environment Element. Unfortunately, many of these General Plan policies are voluntary, flexible, and unenforceable in nature and consequently will be ineffective in mitigating the General Plan’s GHG impacts. CEQA requires more. “The purpose of an environmental impact report is . . . to list ways in which the significant effects of such a project might be minimized . . .” CEQA § 21061. The Supreme Court has described mitigation as part of the “core” of an EIR. *Citizens of Goleta Valley v. Bd. of Supervisors of Santa Barbara County* (1990), 52 Cal. 3d 553, 564. It is important to note that the RDEIR’s obligation to identify mitigation is not diminished just because no available mitigation reduces the impact all the way to a less-than-significant level. Any measure that will reduce the severity of the impact is still useful, and still must be identified and analyzed. CEQA Guidelines § 15126.4(a)(1); *cf. Santiago County Water Dist. v. Orange County* (1981) 118 Cal. App. 3d 818, 831.

Many of the policies and programs listed as mitigation in the RDEIR include terms like “shall strive to,” “as feasible,” “shall cooperate with,” “shall work to comprehensively study,” “shall encourage” and “shall monitor and support.” As such, the RDEIR and the CAP provide inadequate commitment to substantive, enforceable climate change mitigation and protection, and fail to provide mechanisms to ensure that

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 62

climate change mitigation will evolve, as appropriate, while enduring across the twenty year project lifespan. Generally, policies that call for “encouraging,” and “supporting” should be modified to actually require the implementation of the policies’ programs. For example, where AQ-2.3 calls for the County to work with TCAG to comprehensively study methods of transportation, which may contribute to a reduction in air pollution in Tulare County, this measure should be changed to “implement and impose an enforceable requirement on developers to contribute toward enhanced transit service” or “adopt a transit mode share goal.” *See* CAP at 72

I21-136  
cont'd

In essence, we can find no evidence that the County is seriously committed to offsetting the substantial increase in GHG emissions that would result from implementation of the General Plan. Additional actions to reduce GHG emissions have been demonstrated to be feasible as evidenced by their adoption by other jurisdictions in California. Tulare County should consider adopting all feasible mitigation measures using the powers the County has to enact ordinances and control development characteristics to reduce GHG emissions.

**6. The RDEIR Inadequately Analyzes and Mitigates the General Plan’s Water Supply Impacts.**

I21-137

As the General Plan admits, Tulare County faces serious limitations with regard to ground water supply. For the Tulare Lake Basin alone, “the total overdraft is estimated at 820,000 acre-feet per year, the greatest overdraft projected in the State, and 56 percent of the Statewide total overdraft.” General Plan at I-11-3. Throughout Tulare County, but especially in the smaller communities and hamlets, the quantity and quality of water supplies cannot be taken for granted. Nonetheless, that is precisely the tack taken by the RDEIR, which assumes, or perhaps hopes, that water supply can keep up with demand.

Most troubling is the RDEIR’s conclusion that there may be insufficient groundwater supplies to satisfy demands from the future growth allowed under the General Plan. This impact is discussed in two places in the RDEIR: as part of the Hydrology, Water Quality and Drainage analysis (Impact 3.6-2) and as part of the Public Services analysis (Impact 3.9-1). Under CEQA, an EIR must clearly identify the proposed water supply for the entire project under review, and must then analyze the reliability of that supply. *See, e.g., Vineyard Area Citizens for Responsible Growth, Inc. v. City of Rancho Cordova* (2007) 40 Cal. 4th 412, 431-32; *Santa Clarita Organization for Planning the Environment v. County of Los Angeles* (2003) 106 Cal. App. 4th 715, 722-24; *Napa Citizens for Honest Government v. Napa County Board of Commissioners* (2001) 91 Cal. App. 4th 342, 373-74. If it is uncertain whether the proposed supply can

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 63

provide the needed water, the EIR must also identify an alternative source. *Vineyard Area Citizens*, 40 Cal. 4th at 432. The EIR must finally analyze and disclose the potential environmental impacts of tapping these sources. *Id.*

I21-137  
cont'd

The RDEIR fails to comply with these requirements in several ways. First, the RDEIR lacks the required analysis to determine the location and significance of the Project's impacts on groundwater supplies. The first step in this analysis must be to quantify how much groundwater each community or region will need at full buildout under the proposed General Plan and compare that to the projected, available groundwater supply serving each community or region. Unfortunately, this analysis is missing from the RDEIR. Instead, the RDEIR merely lists the various domestic water service providers throughout the County and states "qualitatively" whether each of these providers will be able to serve the "projected general plan population growth." RDEIR at 3.9-17. In a revised and recirculated EIR, the County must conduct a quantitative analysis of this impact, estimating how much capacity each water service provider has and comparing that to the projected demand for that provider's water at full buildout based on the distribution of land uses under the General Plan.

The purpose of such quantitative analysis is clear: if it demonstrates that there will be insufficient water supplies in any given community or region, the County must identify the steps required to increase capacity or obtain new water sources and consider the environmental impacts of obtaining this supply, including the impacts of constructing any required infrastructure. *Vineyard Area Citizens*, 40 Cal. 4th at 432. Another purpose served by this analysis would be to guide the development of alternatives and mitigation measures. If this analysis reveals that domestic water service providers simply cannot provide sufficient water to satisfy the demands from proposed development in a particular community, the County should—indeed, must—consider adopting policies that limit growth there. The absence of this analysis deprives the public and decisionmakers of sufficient information to draw their own conclusions about the wisdom of this General Plan and its environmental costs. *See Citizens of Goleta Valley*, 52 Cal. 3d at 568; CEQA § 21080(e)(1)-(2).

Even without this analysis, however, the RDEIR acknowledges that at least several domestic water service providers will be unable to serve the additional population and development allowed in accordance with the proposed General Plan. Under CEQA, this determination triggers the RDEIR's obligation to identify and analyze the impacts associated with alternate sources. *See Vineyard Area Citizens*, 40 Cal. 4th at 432. The RDEIR, however, does no such thing, and therefore is legally inadequate.

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 64

The proposed General Plan's water supply policies only paper over the RDEIR's failings. Requiring demonstrated water only on a project-by-project basis, as do Policies WR-3.3 and PFS-2.2, is likely to lead to a haphazard scramble for supplies, as well as the potential over-commitment of limited resources. The County needs to identify and quantify available supplies now, in order to guide growth to those areas with sufficient supplies to support it. The currently proposed policies should certainly remain in the General Plan, although they ought to be strengthened to make clear that the County will not approve any project that does not demonstrate a sufficient water supply over the long term. But these policies are no substitute for the extensive water-supply analysis that CEQA requires of this RDEIR.

I21-138

The RDEIR also overlooks the potentially significant public health impact caused by allowing so much development in an area where the groundwater supplies are frequently contaminated with nitrates. *See* Exhibit 12. Nitrates have been linked to "blue baby syndrome" and other health risks. *Id.* The source of these appears to be fertilizer and byproducts from septic systems. *Id.* Individual wells are especially likely to contain elevated levels of nitrates, but municipal water supplies are at risk as well. *Id.* A revised EIR must contain an analysis of the significant environmental impacts associated with locating new development in areas where groundwater supplies are contaminated.

I21-139

Moreover, the RDEIR concludes these impacts are "significant and unavoidable," while overlooking concrete measures that could reduce them. For example, the RDEIR cites to Visalia's program to mitigate the impacts of development on groundwater resources. RDEIR at 3.6-45. This program imposes fees on water users and those seeking to convert land from agricultural use to urban use. *Id.* These fees, in turn, are used develop "groundwater management programs, purchase surface water for recharge, and purchase water rights for delivery into areas impacting the groundwater reservoir underneath the City." *Id.* The County could adopt a similar program as part of this General Plan Update to mitigate the Project's water supply impacts.

I21-140

In its discussion of cumulative water supply impacts, the RDEIR relies on state water planning statutes, SB 610 and SB 221, to prevent such impacts. This reliance is misplaced and unsupported. The existence of these statutes does nothing to relieve the EIR of its obligation to explain the County's water supply plans and to analyze the environmental impacts of these plans. In fact, SB 610 requires that the County prepare that analysis now. *See* Water Code §§ 10910(b) & 10912(a)(7). The County's failure to do so violates state water law requirements.

I21-141

Moreover, for future development projects, it is not clear that state water laws will do the job that the RDEIR claims. The water supply statutes' requirements

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 65

apply only to developments over a certain size—generally, 500 residential units. *See* Gov. Code § 66473.7(a)(1). The RDEIR asserts that “[m]ost new development throughout the County” would meet the statutory thresholds, but it offers no evidence. RDEIR at 5-10. There is nothing in the RDEIR to indicate that development would follow this pattern, and, in the absence of an adequate land use plan, there is no reason to believe that development will proceed through such large projects, rather than through the haphazard growth of smaller subdivisions. Knowing that the County is relying solely on state mandates, and not performing its own water supply inquiries, developers are likely to size their projects in order to evade review under SB 610 and SB 221. The County may well see a sudden increase in the number of 499-unit subdivision applications. In short, in the absence of substantial evidence, the County cannot rely on the mere assumption that state laws will prevent any cumulative water supply impacts.<sup>9</sup>

I21-141  
cont'd

Water supply planning is serious business in Tulare County. When the members of the Council of Cities come to the Local Agency Formation Commission with annexation and development proposals, Commissioners consistently—and appropriately—ask tough questions about water supply, ensuring that the cities do not take on projects without knowing, well ahead of time, that water is available. CEQA, and good public policy, demand that the County ask itself the same hard questions.

I21-142

**7. The RDEIR Inadequately Analyzes and Mitigates the General Plan’s Impacts Related to Public Services.**

I21-143

The RDEIR fails to adequately consider the ability of the County to provide adequate public services and utilities to support buildout of the General Plan. The purpose of analyzing public services is to determine whether a project will lead to additional demand that could, in turn require construction or other activities that might have environmental impacts. The RDEIR goes through the motions of performing this analysis, but in the end produces only generic descriptions of potential impacts, with no specific information about what might actually happen under the General Plan.

---

<sup>9</sup> The RDEIR also asserts that the General Plan includes “several policies” applicable to all projects that will address this impact by clarifying how the County will “work with local service providers to address the phasing of future development and the availability of an adequate water supply.” RDEIR at 5-10. However, the RDEIR does not indicate which policies these are or how they will reduce the project’s cumulative impacts on water supply.

I21-144

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 66

The RDEIR's discussions of schools, fire protection, police services, sanitary sewer, landfill, and water treatment all follow the same pattern. Like the initial DEIR, the RDEIR largely acknowledges that new facilities will likely be needed, and then reels off a brief list of the types of impacts that might occur and declares the impacts to be unavoidable. In effect, the RDEIR simply states that there could be impacts and moves on. It does not explain by how much demand will exceed supply or when in the life of the General Plan new facilities might be needed, nor does it give any indication of *where* new construction might take place. This analysis is insufficient; the RDEIR must include more detail about the specific impacts connected with each type of facility before it will be adequate under CEQA. *See Whitman v. Bd. of Supervisors of Ventura County* (1979) 88 Cal. App. 3d 397, 412 ("The use of phrases such as 'increased traffic' and 'minor increase in air emissions,' without further definition and explanation, provides neither the responsible agency nor the public with the type of information called for under CEQA.").

I21-145

The RDEIR's treatment of the General Plan's impact on wastewater facilities is particularly deficient. As with other sections of the RDEIR, the RDEIR does not correlate the County's planned growth and distribution of land uses with its projected wastewater demand in 2030, so there is no indication that the wastewater systems analysis is, in fact, based on buildout of the General Plan. Indeed, the RDEIR states that for the unincorporated areas not identified as "communities" within the General Plan, an assumed growth estimate of 2% across the board is applied for capacity analysis purposes. RDEIR at 3.9-50. An "assumed growth rate" for all of the "unincorporated areas not identified as 'communities'" would indicate that wastewater demand is not based on the General Plan at all.

I21-146

Moreover, the RDEIR contains a table identifying year 2030 wastewater treatment capacity needs but omits any information as to the methodology and assumptions for determining the capacity estimates. *See* Table 3.9-22: Year 2030 Wastewater Treatment Capacity Needs. The footnotes for this table—which should provide the necessary detail—are cryptic and uninformative. *See id.* Footnote 1 states "existing number of connections are estimated based upon *available information*;" Footnote 2 states "Year 2030 ESDs (Projected Need) is estimated based upon *preferred General Plan Alternative, with necessary adjustments for analysis purposes*." *Id.* (emphasis added). None of this information appears to take into account the increase in wastewater from the General Plan's actual land uses (i.e., increases in residential, commercial, industrial development). Without some indication that the RDEIR's identification of wastewater demand reflects 2030 conditions, it is not possible to

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 67

determine by how much demand will exceed supply or when in the life of the General Plan new facilities might be needed.

I21-146  
cont'd

In addition, the RDEIR's discussion of wastewater facilities and service providers contains only the most cursory information relating to the provision of this important public service. According to Table 3.9-22, numerous wastewater treatment providers would have deficient capacity in 2030. *See* RDEIR at 3.9-51.<sup>10</sup> The document correctly identifies this impact as significant, concluding that the General Plan would result in wastewater treatment demand in excess of planned capacity that cannot be met by new or expanded facilities. RDEIR at 3.9-50. Yet rather than grapple with the serious issue of how wastewater service would be provided to accommodate the County's planned growth, the document largely punts the issue suggesting that the provision of adequate wastewater system capacity in Tulare County is largely outside the control of the County. *Id.* The RDEIR further suggests that these wastewater treatment providers "must ... expand as needed to accommodate projected growth within each service area." *Id.* But the document provides no explanation as to why these agencies *must* provide wastewater service to meet County demand. Nor does the document identify how, exactly, this increase in service would occur. It is the purpose of this RDEIR to provide this necessary analysis.

The RDEIR errs further when it suggests, absent evidence or analysis, that the eight incorporated cities within the County would likely have the capacity to accommodate projected growth due to "advanced planning and capital improvement financing capabilities." RDEIR at 3.9-51 and 52. Again it is the purpose of this RDEIR to actually evaluate the feasibility of other jurisdictions or wastewater service agencies to provide wastewater service. Such an analysis must be supported by substantial evidence. *Laurel Heights I*, 47 Cal. 3d at 409. Moreover, it is especially ironic that the EIR preparers tout the importance of the cities' advanced planning capabilities when it is precisely the purpose of this General Plan—and its EIR—to *plan* for the County's future wastewater needs.

The RDEIR's failure to provide specific information about the General Plan's approach to land use development results in significant omissions in analysis. Several cities in the County have recognized the problems that can accompany County-

I21-147

---

<sup>10</sup> Again, it is not clear what information the RDEIR preparers relied upon to determine these capacity deficiencies or whether the projections relate in any way to the draft General Plan's proposed land uses.

I21-146  
cont'd

David Bryant, Project Planner  
May 26, 2010  
Page 68

initiated urban development within cities' UDBs and UABs. Because these developments are typically not dense enough or are too geographically remote from urban wastewater systems, the developments must be served by septic systems or on-site package sewage treatments plants. Failure of septic systems and insufficient maintenance can result in water quality degradation and other environmental harm. Moreover, adjacent cities often find themselves in the position of having to extend wastewater service – at great cost – to these insufficiently planned developments.

I21-147  
cont'd

In addition, the RDEIR fails altogether to analyze whether the proposed General Plan would exceed the wastewater treatment requirements of the Central Valley Regional Water Quality Control Board. *See* RDEIR Significance Criteria at 3.9-33. This analysis is particularly important inasmuch as it is compliance with wastewater requirements that ensures wastewater treatment service does not cause degradation of groundwater quality. The RDEIR's failure to conduct this analysis is particularly egregious inasmuch as it may not be possible to permit sufficient wastewater treatment capacity to meet the County's wastewater demand. This General Plan update process is exactly the moment for the County to evaluate and resolve public utility constraints and evaluate their environmental impacts. Planning for these types of infrastructure challenges is one of the purposes of the General Plan. The County, however, has opted again not to undertake any planning, but instead to put it off until demand begins to catch up with supply and the need becomes acute. The County must take a more forward-looking approach to planning for public utilities.

I21-148

Finally, as with the RDEIR's approach to mitigation for the General Plan's other environmental impacts, the document fails to provide effective mitigation to reduce the Project's "significant and unavoidable" impacts relating to wastewater facilities. Here too, the RDEIR looks to measures that call for the County to encourage urban development to be located in existing UDBs and HDBs where infrastructure is available or may be established in conjunction with development. *See* PF-1.4 at 2-7 (emphasis added). This policy is too vague and flexible to ensure that adequate infrastructure is in place prior to urban development. Moreover, this policy could actually result in the exact impacts it was intended to prevent. As discussed in the land use section of this letter, there are numerous examples of County-initiated development within a city's UDB that have resulted in extensive infrastructure impacts.

I21-149

**8. The RDEIR Fails to Adequately Analyze and Mitigate the General Plan's Impacts on Biological Resources.**

I21-150

Tulare County has a multitude of sensitive and critical habitats and an astonishing array of special-status species that have the potential to occur in Tulare

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 69

County. RDEIR at 3.11-6 through 3.11-20. The California Natural Diversity Database and the California Native Plant Society for Tulare County lists 182 listed species. *Id.* at 3.11-20. Given these extraordinary biological resources, one would expect the RDEIR to provide a comprehensive analysis of the effect that implementation of the General Plan would have on the County's plant and wildlife communities.

I21-150  
cont'd

Yet, the RDEIR never actually evaluates how growth expected under the General Plan would impact sensitive habitats, or plant and wildlife communities. Instead, the document takes the novel approach of assessing whether the proposed General Plan includes adequate provisions to ensure protection of the resources. *Id.* at 3.11-30. While this exercise is certainly necessary, it does not release the County from its obligation of actually analyzing how growth from the General Plan would affect resources. CEQA requires that an EIR be detailed, complete, and reflect a good faith effort at full disclosure. CEQA Guidelines § 15151. The document must provide a sufficient degree of analysis to inform the public about the proposed project's adverse environmental impacts and to allow decisionmakers to make intelligent judgments. *Id.* Consistent with this requirement, the information regarding the project's impacts must be "painstakingly ferreted out." *Environmental Planning and Information Council of Western El Dorado County v. County of El Dorado*, 131 Cal. App. 3d 350, 357 (1982) (finding an EIR for a general plan amendment inadequate where the document did not make clear the effect on the physical environment).

To analyze impacts to biological resources, the RDEIR must include not just lists of species and habitats, but maps showing their locations (and migration corridors) in the County and textual explanations of the species' needs and their status—a discussion, that is, of how rare they are locally and overall, and how development under the General Plan might threaten them. Having established the baseline, the RDEIR would then need to compare the locations of habitat and species to the locations of development, and to propose concrete, enforceable mitigation measures to protect any threatened resources. Of course, this analysis must look to the maximum densities allowed under the proposed General Plan in order to determine where development will effect biological resources.

Until it follows these steps, or undertakes some similar procedure to determine the potential impacts of development under the General Plan, this RDEIR's analysis will remain thoroughly inadequate. Furthermore, until this analysis is undertaken, it is not possible to identify or evaluate feasible mitigation measures capable of minimizing the Project's significant impacts on biological resources.

**9. The RDEIR Inadequately Analyzes the General Plan's Cumulative Impacts.**

I21-151

Under the CEQA Guidelines, “a cumulative impact consists of an impact which is created as a result of the combination of the project evaluated in the EIR together with other projects causing related impacts” CEQA Guidelines § 15130(a)(1). Because “[c]umulative impacts can result from individually minor but collectively significant projects” (CEQA Guidelines § 15355(b)), an impact that appears less than significant (or mitigable to such a level) when only the project is scrutinized may turn out to contribute to a significant cumulative impact. In that case, the EIR must determine whether the project’s contribution is “cumulatively considerable,” that is, whether its “incremental effects . . . are significant when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects.” CEQA Guidelines § 15065(a)(3); *see also Kings County Farm Bureau*, 221 Cal. App. 3d at 729. This mandate assumes even greater importance for a program-level EIR such as this one. *See* CEQA Guidelines § 15168(b)(4) (programmatic EIR allows agency to “consider broad policy alternatives and program-wide mitigation measures” at an early stage when the agency has greater flexibility to deal with cumulative impacts.)

To analyze the General Plan’s potentially significant cumulative impacts, the RDEIR purports to consider “a summary of projects contained in an adopted general plan or related planning document or in a prior environmental document which has been adopted or certified, which described or evaluated regional or area wide conditions contributing to the cumulative impact.” RDEIR at 5-4 (citing CEQA Guidelines § 15130(b)). However, the only relevant “summary of projects” included in the RDEIR is Table 5-2, which simply lists the “planning timeframe,” “buildout population,” and “significant environmental impacts” of general plans adopted by the eight incorporated cities within the County and the neighboring counties of Fresno, Kern, and Kings.<sup>11</sup> *Id.* at 5-5. It does not include “a summary of projects” contained in these adopted plans, or any indication of whether these documents “described or evaluated regional conditions contributing to the cumulative impact,” as required by the CEQA Guidelines § 15130(b).

<sup>11</sup> The RDEIR does not even include this minimal information about the cities of Woodlake and Exeter. RDEIR at 5-5. Contrary to the assertion in the RDEIR concerning the unavailability of the plans, these general plans are available and are attached to this comment letter.

I21-152

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 71

In fact, after listing these general plans, the RDEIR goes on to analyze the Project's cumulative impacts without once referring back to the general plans<sup>12</sup>

I21-152  
cont'd

Instead, the cumulative impacts section of the RDEIR largely repackages, in abbreviated form, the project-specific impact analysis. In doing so, the RDEIR misses the point of cumulative impacts analysis entirely. For example, the RDEIR concludes that the Project would not contribute considerably to cumulative Fire Protection and Emergency Medical Services impacts because the RDEIR's project-specific analysis "took into consideration the potential growth within the area that would be provided emergency services by the County and no significant impact was identified." *See* RDEIR at 5-9; *see also* RDEIR at 5-9 to 5-10 (applying similar logic to Law Enforcement Services and Schools). However, the project-specific analysis did not analyze whether the buildout allowed under the County General Plan, together with development in the Cities and neighboring counties, would cause significant cumulative impacts on these services.

The very purpose of cumulative impact analysis is to determine whether impacts that appear insignificant in isolation add up to significant damage the environment. Thus, the fact that individual projects have only less than significant impacts is no answer to the question whether they, taken together, have a cumulative impact. *See Kings County Farm Bureau*, 221 Cal. App. 3d at 720. The RDEIR must take a hard look at the impacts of the General Plan together with the impacts of development in the Cities and neighboring counties, and after undertaking that analysis, must determine whether the General Plan's contribution to such impacts are cumulatively considerable.

The RDEIR not only violates CEQA by failing to provide a legally adequate analysis of cumulative impacts, it violates CEQA by failing to propose feasible mitigation to reduce those impacts. The RDEIR acknowledges that the General Plan could contribute considerably to numerous significant cumulative impacts (e.g., aesthetics, traffic, air quality, climate change, noise, solid waste, water supply and delivery, flooding, agricultural resources, biological resources). Nonetheless, it identifies

I21-153

<sup>12</sup> The RDEIR also lists four proposed developments within the unincorporated County—Goshen, Yokohl Ranch, Rancho Sierra and Earlimart—and states that these projects "are taken into consideration for the cumulative impacts discussion and analysis." RDEIR at 5-5 to 5-6. However, the RDEIR does not mention these developments in the subsequent analysis of the Project's cumulative impacts.

I21-154

David Bryant, Project Planner  
May 26, 2010  
Page 72

no additional mitigation measures that could reduce these significant impacts, as required by CEQA. *See* CEQA Guidelines § 15130(b)(5). As in its project-specific analysis, the RDEIR assumes unfettered urbanization is inevitable. In doing so, the RDEIR overlooks the County's vast potential for guiding the foreseeable development and mitigating its impacts through strong General Plan policies and meaningful land use designations. The resulting RDEIR, which jumps straight to the conclusion that the General Plan's impacts will be significant *and* unavoidable, is inadequate.

I21-153  
cont'd

**C. The RDEIR Fails to Adequately Mitigate the Impacts that Will Occur as a Result of the General Plan.**

I21-154

CEQA requires that an EIR identify, and the decisionmakers adopt, all feasible mitigation measures that would reduce or avoid a project's significant impacts. CEQA § 21002; CEQA Guidelines § 15091(a)(3). The agency must comply with this requirement even if the mitigation would not reduce the impact to a less than significant level, as long as the measure would have some mitigating effect. As discussed in the environmental impact sections of this letter, CEQA requires that "mitigation measures proposed in an EIR must be "fully enforceable" through permit conditions, agreements, or other legally binding instruments." CEQA § 21081.6(b); CEQA Guidelines § 15126.4(a)(3). Uncertain, vague, and speculative mitigation measures have been held inadequate because they lack a commitment to enforcement. *See, e.g., Anderson First Coalition*, 130 Cal. App. 4th at 1188-89 (holding traffic mitigation fee measure inadequate under CEQA due to vagueness in program for implementing required improvements). Here, the RDEIR is utterly deficient because it: (a) fails to identify all feasible mitigation for impacts the EIR identifies as significant and unavoidable; and (b) contains measures that are unenforceable, uncertain and vague. In addition, the General Plan policies that the RDEIR documents rely on are discretionary and ineffective.

**1. The RDEIR Fails to Identify and Analyze All Feasible Measures for Impacts that the RDEIR Finds Significant and Unavoidable.**

I21-155

The RDEIR finds that the implementation of the General Plan would result in nearly two dozen significant and unavoidable environmental impacts. *See* RDEIR at ES-12 through ES-26. Contrary to the RDEIR's conclusions, these impacts—including the loss of agricultural land, adverse effects on water supply and quality, wastewater treatment, solid waste, biological resources, flood hazards, traffic, air quality, climate change, noise, cultural and visual resources, and growth-inducing impacts—are certainly avoidable. Yet, the County abdicates its responsibility under CEQA to consider and approve specific mitigation measures that could reduce these impacts.

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 73

The County cannot approve a project with significant environmental impacts if there are feasible mitigation measures that would substantially *lessen* those effects (even if they are not completely avoided or reduced to a less than significant level). CEQA § 21002. Moreover, the RDEIR may not avoid disclosure and analysis of the significant environmental impacts of a project by merely concluding that those impacts are unavoidable. CEQA does not permit a lead agency to “travel the legally impermissible easy road to CEQA compliance” by “simply labeling [an] effect ‘significant’ without accompanying analysis.” *Berkeley Jets*, 91 Cal. App. 4th at 1371.

I21-156  
cont'd

The numerous significant environmental impacts brought about by the proposed General Plan are not inevitable as the RDEIR would imply; to the contrary, if the RDEIR had proposed and analyzed adequate mitigating measures—as required under CEQA—some of those impacts could certainly be avoided. This letter identifies numerous feasible mitigation measures that would certainly help to offset the General Plan’s significant environmental impacts. The revised EIR must evaluate the feasibility of these measures and the County must adopt those measures that are determined to be feasible.

**2. The RDEIR Contains Inadequate Mitigation Measures that Are Unenforceable, Uncertain, and Vague and Thus Do Not Ensure Impacts Will Be Reduced to Insignificant Levels.**

I21-157

The RDEIR finds in numerous instances that Project impacts would be mitigated to less than significant levels through the implementation of mitigating policies and implementation measures. *See e.g.*, Impact 3.4-2: wasteful, inefficient energy consumption at 3.4-29; Impact 3.5-1: construction noise impacts at 3.5-23; and Impact 3.9-7: school services or facilities at 3.9-64. In each of these instances, the RDEIR fails to put forth measures to mitigate the impacts that are specific and enforceable.

For example, with regard to the Project’s significant impact on energy resources, the RDEIR identifies policy ERM-4.8 calling for the County to encourage renovations and new development to incorporate energy efficiency (*Id.* at 3.4-30). Yet, as this policy makes clear, the County is not actually committing itself to take any specific action to reduce energy consumption.

I21-158

The RDEIR does no better in its attempt to mitigate the General Plan impacts on school facilities since the measure simply states that “the County may require new projects to mitigate impacts on school facilities...” *See* PFS Implementation Measure #3 at 3.9-66. This empty shell of a measure provides no assurance that the County would even try to mitigate impacts to school facilities, let alone provide a specific

I21-159

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 74

proposal for accomplishing this task. The RDEIR nonetheless touts this insubstantial measure in concluding that the General Plan's impact on school facilities would be less than significant. *Id.* at 3.9-67.

I21-159  
cont'd

Finally, as regards the Project's significant construction-related noise impacts, Policy HS-8.18 calls for the County to seek to limit construction noise to the hours of 7 a.m. to 7 p.m. (at 3.5-24) as if elevated construction noise levels during these daytime hours would not be bothersome or annoying. In the absence of specific information about the decibel level of construction operations, and the location of potentially affected noise-sensitive land uses, the RDEIR cannot simply conclude, as it currently does, that construction-related noise impacts would be mitigated to a less than significant level. Because the RDEIR provides no basis to judge the effectiveness of this measure, it is a "mere expression[]" of hope" that the County will be able to devise a way around the problem of elevated construction noise levels. *Lincoln Place Tenants Assn. v. City of Los Angeles* (2005) 130 Cal. App. 4th 1491, at 1508. CEQA requires more than that to mitigate significant impacts. *Id.*

I21-160

Because the RDEIR relies on vague, flexible and non-enforceable mitigation measures, it lacks the evidentiary basis to conclude that Project impacts would be reduced to less than significant levels.

I21-161

**3. The Policies the RDEIR Relies on to Reduce the Project's Impacts to Less Than Significant Levels Are Discretionary and Ineffective.**

I21-162

The RDEIR relies on myriad policies and implementation measures to conclude that environmental impacts from the General Plan would be less than significant and therefore have no need for mitigation. Again and again, the RDEIR fails to actually analyze the Project's potentially significant environmental impacts, instead it merely looks to the implementation of General Plan policies before boldly concluding that impacts would not be significant (*see e.g.*, Impact 3.1-2: conflicts with applicable adopted land use plans at 3.1-22; Impact 3.2-4: substantial increase in public transit usage at 3.2-35; Impact 3.3-1: exposure of sensitive receptors to construction-related air emissions at 3.3-18; Impact 3.3-5: expose a substantial number of people to objectionable odors at 3.3-27; Impact 3.4-1: result in wasteful or inefficient energy consumption due to population growth at 3.4-26; and Impact 3.6-4: create additional stormwater runoff that would exceed capacity of existing drainage systems at 3.6-50). Yet, here too the RDEIR relies on General Plan policies that are vague, speculative and unenforceable and therefore would not effectively reduce the Project's significant environmental impacts.

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 75

Moreover, the RDEIR makes no effort whatsoever to evaluate the effectiveness of the General Plan policies and thus lacks the evidentiary basis to conclude that the specific environmental impact would be less than significant. In addition to the examples already discussed in this letter (*see e.g.*, odor impact analyses), the RDEIR's approach to policies relating to the Project's potential to result in wasteful, inefficient, or unnecessary energy consumption is particularly disingenuous. In this instance, the RDEIR uses flexible and non-enforceable language such as "the County shall ensure whenever possible" (TC-1.6); "the County shall strive to meet" (TC-1.18); "the County will continue to work with" (TC-4.2); and "the County shall consider" (TC 5.2). Thus, while the RDEIR would appear to include a long list of policies intended to reduce impacts, a careful review demonstrates that very few, if any, of the policies would provide a meaningful reduction in impacts. In the absence of such policies, the RDEIR has no evidentiary basis to conclude that Project impacts would be less than significant. The RDEIR must be revised to include mandatory and legally binding General Plan policies.

I21-162  
cont'd

**D. The DEIR's Analysis of Alternatives to the Proposed General Plan Update Is Inadequate.**

I21-163

As discussed above, this General Plan will determine the shape of growth in Tulare County for decades to come. Determining which policies become a part of the Plan is likely to be one of the most important decisions the current Board of Supervisors will make. It is thus crucially important that the Board and the public have all of the available information before them.

This RDEIR, of course, is the main vehicle for that information. And at the "core of an EIR" lies the analysis of alternatives. *Citizens of Goleta Valley*, 52 Cal. 3d at 564. "Without meaningful analysis of alternatives in the EIR, neither the courts nor the public can fulfill their proper roles in the CEQA process . . . [Courts will not] countenance a result that would require blind trust by the public, especially in light of CEQA's fundamental goal that the public be fully informed as to the environmental consequences of action by their public officials." *Laurel Heights I*, 47 Cal. 3d at 404. An EIR therefore must analyze a reasonable range of alternatives to the proposed project. *Citizens for Quality Growth v. City of Mount Shasta* (1988) 198 Cal. App. 3d 433, 443-45. A reasonable alternative is one that would feasibly attain most of the project's basic objectives while avoiding or substantially lessening the project's significant impacts. *See* CEQA § 21100(b)(4); CEQA Guidelines § 15126.6(a).

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 76

Although the RDEIR presents some worthy alternatives, it does not live up to these standards. Its analysis of these alternatives—like almost all of its impact analyses—lacks any real discussion of their environmental effects and is therefore inadequate. Moreover, the RDEIR gives short shrift to the City-Centered Alternative, both understating its environmental benefits and incorrectly claiming that it will not meet the project objectives.

I21-163  
cont'd

**1. The City-Centered Alternative Is Environmentally Superior.**

I21-164

The RDEIR presents both a City-Centered Alternative, in which growth is directed to areas inside the UDBs of the County's eight incorporated cities, and a Confined-Growth Alternative, which allows more growth in unincorporated communities and hamlets, but limits UDB modifications so that the total area inside a given UDB does not grow. The RDEIR determines that the Confined-Growth Alternative is environmentally superior, but it can only arrive at this conclusion by underestimating the benefits of the City-Centered Alternative.

The RDEIR does not explain why it finds the Confined Growth Alternative superior to the City-Centered Alternative. While the RDEIR notes that the Confined Growth Alternative would "convert less open space and prime agricultural farmland than the proposed project," and "has the potential to result in fewer impacts to scenic resources" (RDEIR at 4-36), the City-Centered Alternative boasts these benefits, as well. RDEIR at 4-20. In fact, the only apparent benefit of the Confined Growth Alternative is its strong policies limiting the expansion of urban development boundaries of hamlets and planned communities. But, under a City-Centered Alternative that coordinated development with annexation, there would be little call to modify the UDBs of these communities at all, because growth would be directed to the Cities rather than to these areas. Under the City-Centered Alternative, the Cities, rather than unincorporated areas, would absorb population growth. Thus, the City-Centered Alternative would be just as effective at reducing the Project's impacts as the Confined Growth Alternative.

Indeed, the City-Centered Alternative provides an additional environmental benefit missing from the Confined Growth Alternative: as the RDEIR states, the City-Centered Alternative would reduce the total vehicle miles traveled in the County. RDEIR at 4-20 and -21. This is mainly common sense—if housing is concentrated in denser areas, closer to jobs and services, people will drive less both because they will be closer to these jobs and services and because good transit systems are easier to develop and maintain under such circumstances. What does not make sense, however, is the RDEIR's failure to follow through on this logic. If the alternative would reduce vehicle miles, then it would, by definition, reduce emissions from vehicles, including greenhouse gases. The

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 77

RDEIR, however, claims that the alternative would have similar air quality and global warming impacts as the project as proposed. *Id.* This conclusion is illogical and unsupportable. The City-Centered Alternative could reduce these impacts substantially.

I21-164  
cont'd

The COC would support and encourage an even stronger City-Centered Alternative—one that directs 90% or more of future growth to the Cities and coordinates development with annexation. Such an alternative could even incorporate the strong policies of the Confined Growth Alternative, limiting UDB modification in areas that will not be incorporated by the Cities. This strengthened City-Centered Alternative would further reduce the significant environmental impacts caused by the County's anticipated growth and achieve the goal of encouraging coordination with the Cities.

Such an alternative is also feasible. As the County itself recognized in its Policy Alternatives Newsletter (July 2005), there is more than enough room in the Cities' UDBs and UABs to accommodate the growth projected by the County. *See* Exhibit 16 at 26. Moreover, since that report was issued, the Cities of Porterville, Tulare, Dinuba and Woodlake have adopted general plan updates expanding the capacity for development in their planning areas, and Visalia is currently updating its general plan, which will similarly increase its ability to accommodate growth within its planning boundaries. Nor would this truly City-Centered alternative impair the County's ability to meet its affordable housing needs. As recognized by the County in its 2010 Housing Element, there are sufficient sites in the existing unincorporated communities under the current general plan land use designations and zoning to accommodate all of the County's Regional Housing Needs for the 2007-2014 cycle. *See* 2010 Housing Element at 162-164.<sup>13</sup>

The RDEIR might have reached a different conclusion about the environmentally superior alternative if it had performed a more complete analysis of all the alternatives, as required by CEQA. A valid alternatives section must include meaningful analysis—including quantitative analysis, where possible—comparing the proposed Project's environmental effects with those of particular alternatives capable of reducing the Project's significant unmitigable impacts. *See* CEQA Guidelines § 15126.6(b); *Laurel Heights I*, 47 Cal. 3d at 401-04; *Kings County Farm Bureau*, 221 Cal. App. 3d at 732 (“[I]f there is evidence of one or more potentially significant impacts,

---

<sup>13</sup> According to Table 7-D, there are sites within the 22 existing communities that could accommodate 9,524 new units, including 4,117 low income, 4,392 moderate income, and 1,015 above moderate income units. 2010 Housing Element at 163.

David Bryant, Project Planner  
May 26, 2010  
Page 78

the report must contain a *meaningful* analysis of alternatives . . . which would avoid or lessen such impacts.”) (emphasis added). The RDEIR contains no such analysis, generally devoting just one paragraph to its discussion of each of the impact categories. *See generally* RDEIR at Chapter 4.

I21-164  
cont'd

**2. The DEIR Provides No Valid Reason for Rejecting the City-Centered Alternative.**

I21-165

Under CEQA, an agency may not approve a proposed project if a feasible alternative exists that would meet the project's objectives and would diminish or avoid its significant environmental impacts. CEQA § 21002; *Kings County Farm Bureau*, 221 Cal. App. 3d at 731. The City-Centered Alternative would clearly reduce the General Plan's impacts, and there is no suggestion in the RDEIR that it is infeasible. The RDEIR provides only two reasons why this alternative should not be selected: it would not, the DEIR claims, meet the project objectives of allowing unincorporated communities to grow, nor would it promote “reinvestment” in unincorporated communities and hamlets. DEIR at 7-4. Neither of these claims can support the rejection of the City-Centered Growth Alternative. The first is an excessively narrow objective, and therefore not a sufficient reason to reject the alternative, while the second is factually unsupported.

An EIR cannot provide a meaningful comparison between the project and various alternative courses of action unless the project's objectives are defined broadly enough to make such alternatives at least potentially possible. *See Kings County Farm Bureau*, 221 Cal. App. 3d at 735-37; *City of Santee v. County of San Diego* (1989) 214 Cal. App. 3d 1438, 1455. Here, growth in the unincorporated communities is a part of the proposed Project. Cailing such growth an objective of the General Plan is tantamount to saying that the objective of the Project is to implement the Project. Narrowing the Project's goals in this way tilts the analysis of alternatives unavoidably—and illegitimately—toward the General Plan as proposed. Rather than providing the required reasoned, objective analysis, the RDEIR has become “nothing more than [a] *post hoc* rationalization[.]” for a decision already made. *Laurel Heights I*, 47 Cal. 3d at 394.

The Council of Cities wishes to be very clear about its position on this issue: Tulare County's unincorporated communities and hamlets absolutely need and deserve the County's support and investment. These areas have tremendous infrastructure needs, and the Council of Cities is in favor of taking all appropriate countywide action to resolve these problems. The communities and hamlets are not to be abandoned or left to fend for themselves. Concentrating growth outside the cities, however, is not a solution to the County's infrastructure problems, nor should it be an essential goal of this General Plan. As the DEIR recognizes, confining growth to the

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 79

cities and coordinating that growth with annexation would produce growth that avoided many of the environmental impacts associated with the proposed General Plan. This alternative therefore should not be taken off the table merely because it offers a growth pattern different from the proposed Plan.

I21-165  
cont'd

Moreover, a City-Centered Alternative could be crafted to meet the Project goals of investing in existing rural communities and hamlets. In fact, the RDEIR never states how the proposed Project itself would meet these goals. Simply allowing more people to live in these communities is certainly not the solution: there is no evidence that doing so will make it any more economically feasible to provide them with the municipal water and sewer services they need. *See* Exhibit 7 (Michelle Anderson, *Cities Inside Out: Race, Poverty, and Exclusion at the Urban Fringe*, 55 UCLA L. Rev. 1095, 1106–1109 (2008) (describing the extreme lack of municipal services in unincorporated communities)); Exhibit 11 (Victor Rubin et al., *Unincorporated Communities in the San Joaquin Valley: New Responses to Poverty, Inequity, and a System of Unresponsive Government* 10 (2007) (noting that the population sizes in unincorporated communities can vary widely)); Exhibit 12 (California Report, *Nitrates in Our Drinking Water, Part 3 – Cleaning up the Past* (May 18, 2010) (reporting that the Inland Empire Utilities Agency spent over \$300 million to construct a water treatment facility for removing nitrates from groundwater)). Nor does the proposed Project include any commitments to do so.

A City-Centered Alternative could provide reinvestment for the unincorporated communities and hamlets. Reinvestment is ultimately a question of revenue. City-centered growth would not only provide the County with more revenue than uncontrolled, sprawling growth, it is also likely to cost less in services, leaving more flexibility to support the unincorporated areas. More city-centered growth may concentrate economic activity within municipal boundaries and also allow the regional economy to “draw on usable excess operating capacity in already developed areas as well as efficiencies of service delivery.” National Research Council, “Costs of Sprawl Revisited” (1998) at 55-57 (attached as Exhibit 6 to COC’s April 11, 2008 Comment Letter.). For example, one landmark study of urban growth plans in New Jersey concluded that the plan gave municipalities an annual increase in revenues of some \$112 million, or 2% of operating budgets, mostly by concentrating population and jobs in already developed areas and by creating or expanding centers in newly developing areas. *Id.* at 55.

Real-world experience in Visalia bears this out. A table illustrating the tax revenues from various development scenarios at the North Plaza Drive Industrial Park is attached to the City of Visalia’s March 1, 2010 Staff Report. *See* Exhibit 16 at 17. Comparing the first two columns shows the large increase in County revenue brought

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 80

simply by annexing the land into the City. Even though the County's share of the tax allocation is slightly reduced, the assessed value of the land increases so much that the County is much better off. Concentrating growth within city limits will improve County revenues without increasing burdens on County services, and thus will allow the County to increase the services it provides to existing communities in the unincorporated areas.

I21-165  
cont'd

In addition to improving revenues, city-centered growth can reduce the cost of providing services. Substantial savings are to be had from compact growth across the county in areas such as land conversion, water and sewer infrastructure, road construction, real estate development, and public services costs, with a net benefit to public finances of roughly \$4 billion annually by 2025. *See Carruthers and Úlfarsson, Does "Smart Growth" Matter for Public Finances?*, U.S. Department of Housing and Urban Development Working Paper # REP 06-02 (attached as Exhibit 8 to COC's April 11, 2008 Comment Letter). These researchers found that,

if the nation's land use patterns had somehow evolved differently, and development everywhere was 25% more dense, public services would cost, in net, \$3.63 billion less annually; if it were that much less expansive, public services would cost \$6.56 billion less annually. The second scenario suggests that, if development everywhere was 50% more dense, public services would cost \$7.25 billion less annually; if it were that much less expansive, public services would cost \$13.12 billion less annually.

*Id.* § 4.2 at 16. By way of illustration, a hypothetical county of 88,000 residents with per capita expenditures of \$3,200 could expect to save up to \$4.3 million annually if it were 50% more dense. "In sum, the results for these two variables show that, other things being equal, the kind of low-density, spatially extensive development patterns that characterize sprawl cost more to support than the high-density, compact development patterns that the smart growth movement advocates." *Id.* § 4.1 at 15.

In short, the sprawling growth patterns allowed under the General Plan would bring the County less revenue, and would cost more to serve, than the City-Centered Alternative. The RDEIR offers no evidence in support of its opposite conclusion, let alone the substantial evidence that CEQA requires. It is clear that the RDEIR is simply incorrect when it determines that the City-Centered Alternative would not meet the objective of providing reinvestment for the unincorporated communities. In fact, the City-Centered Alternative is likely to produce more reinvestment for the crucial tasks of providing all of Tulare County's residents with the quality of life they deserve.

May 26, 2010  
Page 81

**E. The RDEIR Must Be Revised and Recirculated.**

I21-166

CEQA requires recirculation of an EIR when significant new information is added to the document after notice and opportunity for public review was provided. CEQA § 21092.1; CEQA Guidelines § 15088.5. *Laurel Heights Improvements Assn. v. Regents of the University of California* (1993) 6 Cal. 4th 1112, 1130 .

As this letter explains, the General Plan RDEIR clearly requires extensive new information and analysis. This analysis will likely result in the identification of new, substantial environmental impacts or substantial increases in the severity of significant environmental impacts. Consequently, the County must revise and recirculate the EIR for public review and comment.

**III. Approval of the Project Would Violate the Regional Welfare Doctrine.**

I21-167

Under the California Constitution, a public agency must adequately consider and address the welfare of the entire region—not just the area within its own jurisdictional boundaries—when exercising its police power. *See Northwood Homes, Inc. v. Town of Moraga* (1989) 216 Cal. App. 3d 1197, 1201 (citing *Associated Home Builders of the Greater Eastbay, Inc. v. City of Livermore* (1976) 18 Cal. 3d 582 ); *Lee v. City of Monterey Park* (1985) 173 Cal. App. 3d 798, 803-804 ; *Arnel Development Company v. City of Costa Mesa* (1981) 126 Cal. App. 3d 330, 336 . If the County were to approve the proposed General Plan, it would turn a blind eye to the General Plan's significant regional consequences, in violation of this constitutional mandate.

The sprawling nature of the proposed Plan's vision for growth in the County will have at least two significant impacts on the welfare of the broader region. First, the proposed Plan would convert tens if not hundreds of thousands of acres of important farmland. According to the RDEIR, agricultural products are one of Tulare County's most important resources, accounting for approximately \$5 billion dollars in gross production value. RDEIR at 3.10-2; *see also* 2008 Tulare County Annual Crop and Livestock Report (reporting that Tulare County's gross production value for agricultural commodities in 2008 was \$5,018,022,800) (attached as Exhibit 17). Moreover, the permanent conversion of so much farmland in a County that provides a substantial percentage of the agricultural products consumed across the state and nation could have a regional impact on food supplies and costs.

I21-168

Second, the proposed General Plan disregards the cooperative, regional approach to climate change called for in Senate Bill 375 and Assembly Bill 32. Both bills require state and local governments to work together to reduce the State's

I21-169

SHUTE, MIHALY  
& WEINBERGER LLP

David Bryant, Project Planner  
May 26, 2010  
Page 82

greenhouse gas emissions. After all, if the State is to meet its goals of reducing greenhouse gas emissions, any increase in emissions created by the proposed Plan must be offset (and then some) by reductions in other jurisdictions. The proposed General Plan, however, would admittedly result in increased emissions by allowing sprawling development, which increases vehicle miles traveled. This antiquated approach to planning puts the desires of the County—i.e., revenue from urban development in unincorporated areas—ahead of the regional and indeed global impacts caused by these increased emissions. Moreover, it places the burden of reducing the State's emissions on other jurisdictions, including the Cities.

I21-169  
cont'd

Third, as discussed above, the General Plan will adversely impact the welfare of the incorporated Cities that lie within the County by allowing the County to approve development within the Cities' UDBs and UABs without first coordinating with the Cities themselves. The General Plan creates a system under which the County "may" cooperate with the Cities—who will, eventually, be saddled with the expense of serving the development that results from County's experiment in urban planning—and "may" engage in responsible planning, but is not required to do so. Indeed, the General Plan expressly contemplates that the County will consider the welfare of the Cities only if those Cities agree to provide the County with adequate payment in return. *See* General Plan at I-2-77 (Implementation Measure 27). While this approach clearly pays close attention to the welfare of the County's coffers, it does not adequately consider the welfare of the region, as required by law.

I21-170

Very truly yours,

RE: General Plan U2030 Update and Draft Environmental Impact Report (SCH No.2006041162)

Dear Mr. Bryant,

Thank you for the opportunity to comment on the Recirculated Draft Environmental Impact Report (DEIR) and the revised Tulare County General Plan Update 2030 (GP).

The Southern Sierra Archaeological Society (SSAS) is an organization whose mission is to protect natural, cultural and historical resources as well as to educate the public on those subjects. The Committee has reviewed the Cultural Resources aspect of the Draft DEIR and the GP Update 2030 on behalf of SSAS. The sections on scenic landscapes, open space and agricultural were also reviewed, in so far as they included cultural resources.

The following comments on the GP follow the Six Principles of a Healthy Growth Alternative as proposed by the Tulare County Citizens for Responsible Growth, particularly Number 6, which states: Provide strong, clear policies with concrete enforceable implementation measures that include definite time frames, funding sources and departments in charge of monitoring and enforcement.

Sincerely,

*Sylvie Robillard*  
Sylvie Robillard, Vice President

I22-1

## Section 1: Introduction

I22-2

The 2010 version of the General Plan (GP) made only minor changes to the goals, policies and implementation measures from the 2008 version. CEQA's purpose is to identify feasible mitigations and alternatives in order to avoid or reduce a project's significant effects on the environment. The GP and Recirculated Draft Environmental Impact Report (RDEIR) do not have clear, measurable, and enforceable policies and implementation measures. Without practical, effective mitigation measures, there is no evidence to support the RDEIR's impact analysis and conclusions

## Part 1, Page 3-10

The County shall consider implementing ...

Part 1, Page 4-22 – LU-1, LU-1.3 and LU-1.5

The County shall promote... The County shall discourage... and The County shall encourage...

## Section 2: Detailed Comments

## General Plan Framework Component (Goals and Policies Report/February 2010/Page A-1)

Concept 2: The County will also utilize its goals and policies to guide the conversion of agricultural and natural resource lands to urban uses.

I22-3

Concept 2: This blatant statement that all agricultural and natural land will, with the County's blessing, be destroyed by cities and towns, would best be left unsaid, even if the destruction of the land is the ultimate goal.

## B. Prosperity

## Principle 3: Protection of Resources

Protect the County's important agricultural resources and scenic natural lands from urban encroachment through the implementation of Goals and Policies of the General Plan.

I22-4

Principle 3: Protection of Resources  
Protect the County's important agricultural resources and scenic natural lands from urban encroachment through *Work Plan/Implementation Measures*. Goals and policies do nothing to protect agricultural, cultural resources and scenic landscapes. Rather protection of these resources is accomplished through strong measurable, enforceable implementation measures.

## Principle 4: Limit Rural Residential Development

Strictly limit rural residential development potential in important agricultural areas outside of unincorporated communities, hamlets, and city UABs, UDBs (i.e., avoid rural residential sprawl).

Concept 4: Development will be avoided in naturally and culturally sensitive areas, wherever possible.

I22-5

## Principle 4: Limit Rural Residential Development

Concept 4: Development will be avoided in naturally and culturally sensitive areas.

<p><b>Add Implementation measure:</b> The County shall become a Certified Local Government (CLG).</p>	<p><b>7.5</b> How are citizen groups defined? A County Cultural Resource Committee would be helpful, or better yet, The Certified Local Government (CLG) Program, which is a national program designed to direct participation of local governments in the identification, registration, and preservation of historic properties. A local government becomes a CLG by developing and implementing a local historic preservation program based on federal and state standards. The plan promotes partnerships with the National Park Service and the State of California. Both entities are in Tulare County. This program was described in the Background Report, Page 9-45, why was it not included in the GP or DEIR? This process insures that local interests and concerns are integrated into the official planning and decision-making process from the beginning.</p>	<p>I22-10</p>
		<p>I22-11</p>

**CULTURAL RESOURCES**

**Concept 4: Natural and Cultural Resources (January 2008 Page A)-As Tulare County develops its unincorporated communities, the County will ensure that development occurs in a manner that limits impacts to natural and cultural resources through the implementation of its Goals and Policies and through proper site planning and design techniques.**

**8. Cultural Resources (Part 1, Page 7-10)**  
Add to the work groups: Southern Sierra Archaeological Society, Native American groups who are recognized under SB-18 and the Tulare River Indian Reservation.

**8.6 ERM-6.2 Protection of Resources with Potential State or Federal Designations (Page 8-11)**

The County should encourage the protection of cultural and archaeological sites. Such sites may be of statewide or local significance and have anthropological, military, political, architectural, economic, scientific, religious, or other values.

**ERM-8.3 Alteration of Sites with Identified Cultural Resources (Page 8-11)**

When planning any development or alteration of a site with identified cultural or archaeological resources, consideration should be...Development should be permitted... site specific investigation (Add) *has been conducted...*

**Implementation 58 (Page 8-20)**

The County shall incorporate provisions into development regulations that in the event archaeological or (Add) resources ... If significant resources are determined to exist (Add)

**ED-5.12 Heritage Tourism (Part 1, Page 5-8).** The County shall encourage

**ED-6** To take full advantage of the natural, cultural, and social opportunities available in the County for the enhancement of tourism.

**8.4 ERM-4 Energy Resources (Part 1, Page 8-14)**

**4.1 Energy Conservation and Efficiency Measures.**

**14. 9 Energy Facilities.**

**PFS-9.4 Power Transmission Lines (Part 1, Page 14-130)**

The County shall work with the Public Utilities Commission and power utilities in the setting of transmission lines to avoid interfering with scenic views, historic resources, and areas designated for future urban development.

**Concept 4: Restore former Concept 4: Natural and Cultural Resources ,** which reads: As Tulare County develops its communities and hamlets, the County will ensure that development occurs in a manner that limits impacts to natural and cultural resources through proper site planning and design techniques. Development will be avoided in naturally and culturally sensitive areas

**8. The Tulare River Indian Reservation**, is a federally recognized entity. SB-18 empowers those Native American groups who are recognized by the State of California. The Southern Sierra Archaeological Society is a group dedicated to preserving cultural resources. These groups would be a good fit under the Certified Local Government Program (CLG), described above, because the National Park, California State Parks and SHIPO are named as working partners.

**8.6 ERM-6.2** The County shall protect cultural and archaeological sites....Add the words: "archaeological, historical" to the list.

When planning any development or alteration of a site with identified cultural, historical or archaeological resources, consideration *shall be...* Development shall be permitted... site specific investigation *by an archaeologist certified by the Register of Professional Archaeologists has been conducted...*

**Imp. 58** The County shall incorporate provisions into development regulations that in the event archaeological or (Add) *buried historical* resources ... If significant resources are determined to exist, *as defined by CEQA*, the archaeologist...

**ED-5.12** Use stronger language.

**ED-6** This is a great goal in a multi-lingual County. However, the language is weak and there are not any implementation measures.

**ERM-4** Use stronger language, such as, The County shall require...

**PFS-9.4** At the current time Southern California Edison is proposing to put their 120 foot power lines on a Tulare County road designated as a Scenic Landscape. See picture, Preservation of Scenic Highways FGMP-1.5. PFS-9.4 is a good example of a meaningless sentence, due to lack of Implementation Measures and meaningful measurements.

LU-7.12 Historic Buildings and Areas. The County shall seek-to-preserve preservation of buildings and areas with special and recognized historic, architectural, or aesthetic value. New development should respect architecturally and historically significant buildings and areas. Landscaping, original roadways, sidewalks, and other public realm features of historic buildings or neighborhoods shall be restored or repaired where ever feasible. [New Policy – Modified Draft EIR Analysis]

LU-7.12 Historic Buildings and Areas. The County shall preserve buildings and areas with special and recognized historic, architectural, or aesthetic value. New development will respect architecturally and historically significant buildings and areas. Landscaping, original roadways, sidewalks, and other public realm features of historic buildings or neighborhoods shall be restored or repaired, after consultation with the . [New Policy – Modified Draft EIR Analysis]

### III. Conclusion

We recommend that the General Plan Update and the Draft Environmental Impact Report be revised to protect cultural resources, scenic landscapes, open space and agriculture from urban encroachment to a greater degree than is proposed in the current draft. Policies and mitigation measures must also be changed to reduce the impacts on the resources.

Tulare County citizens do not want generic, cookie cutter communities that do not reflect their history. Communities that preserve their historical resources for adaptive reuse find economic benefits and revitalization, as the integrity of the historic resources embody a unique sense of place where people want to live, work and play. Many elected officials do not understanding the value and potential profitability of preservation and re use.

Tulare County citizens want zoning regulations and general plan elements that address demolition and provide incentives for preservation and adaptive reuse projects. The Mills Act allows the County to provide tax incentives for rehabilitation. Tulare County must develop cultural resources ordinances and plans, which it has not done to date. The old General Plan mentions a Cultural Heritage Board, but never implemented it. Tulare County needs to survey its cultural resources and keep the survey up to date. Cultural Resource surveys are a valuable tool when planning for future development. (Pub. Resources Code § 21001 subd.(b)) states “take all actions necessary to provide the people of this state with ...enjoyment of historic environmental qualities.” We hope to see our communities in Tulare County revitalized through the adoption of a General Plan and a Environmental Impact Report composed of strong policies with a measurable, enforceable implementation plan.

**RE: Tulare County Draft General Plan 2030 Update and Recirculated Draft Environmental Impact Report  
(SCH No.2006041162)**

Dear Mr. Bryant:

Thank you for the opportunity to comment on the Recirculated Draft Environmental Impact Report (RDEIR) for the revised Tulare County General Plan 2030 Update.	I23-1
--	-------

Tulare County Citizens for Responsible Growth is a diverse group of local residents concerned about the direction of growth in our County. We are united by a desire for a General Plan Update (GPU) that will ensure cleaner air, secure and reliable water supplies, a strong and more diverse economy, and the protection of our agricultural and natural resource lands. We believe that focusing future growth in our existing urbanized areas is the key to achieving these priorities.	I23-2
---	-------

We were pleased to see that many of the value statements and guiding principles set out in the revised General Plan Update express similar desires. However, we are concerned that the revised General Plan Update will not attain any of these goals because it will not meet the goal of creating a compact urban form.	I23-3
---	-------

Our letter begins with a summary of our key concerns and recommendations on the GPU and RDEIR. We then include additional detailed comments on the adequacy of the RDEIR. You will also be receiving comment letters from some individual TCCRG members (which include extensive recommendations on GPU text and policies/measures and RDEIR analysis and mitigation measures). Our comments include both the General Plan Update and the RDEIR since they are each integral to the other.	I23-4
--	-------

# Tulare County Citizens For Responsible Growth

## I. Summary of Concerns

### ◆ Impacts related to sprawl not adequately evaluated or mitigated.

A variety of impacts will result from buildout of any General Plan which permits significant development away from established urban centers, thus devouring agricultural and open space land unnecessarily, contributing to unnecessarily increased VMTs, traffic commutes and traffic congestion, reduced air quality, and a myriad of other impacts. Such is the case with the Tulare County General Plan Update. Its foundation is a Planning Framework which purports to limit growth to existing urbanized areas, largely by assuming that the major portion of new growth will take place within incorporated cities and their designated urban boundaries, and relying on the City general plans as a guide for growth.

123-5

The General Plan Update Recirculated Draft Environmental Impact Report assumes that this land use concept and its implementing policy framework will mitigate potential environmental impacts throughout the County to a large degree. Yet this essential concept is weakened by the actual wording throughout the General Plan to the point that effective mitigation simply cannot be assured.

A critical example is the fact that there is no real requirement in the Plan for the County to adhere to the City general plans for compact growth within their Spheres of Influence and Urban Development Boundaries (UDBs). In addition the County's proposals to establish new "Growth Corridors" and "Planned Communities" (formerly called New Towns) which could be allowed in the rural areas currently intended for open space or agricultural protection because the Plan establishes no set boundaries for such new development.

Likewise, the County has designated 11 small, unincorporated communities as "Hamlets" and provided them with newly devised HDBs within which the RVLP is being repealed. The HDBs appear much larger than necessary to support the modest growth needed to allow for the small scale retail services appropriate to these communities and with no demonstration of any possibility of providing needed public facilities. None of the 11 Hamlets has a Hamlet Plan to guide growth and development. The County is simply declaring them all Mixed Use.

123-6

Where land use designations are not delineated specifically (such as in Hamlets, Growth Corridors, Mountain Service Centers, and Foothill Mixed Use areas), the designation of Mixed Use is applied, permitting any combination of uses and residential development from 1-30 units/ acre, resulting in "an anything goes" plan for much of the unincorporated area.

123-7

Yet the RDEIR does not evaluate the impact of this weakening of the General Plan's basic land use framework. Rather, it generally concludes that loss of agriculture and open space and numerous other impacts caused by sprawl will be significant and unavoidable without even exploring all available mitigation. Clearly, strengthening the land use framework to better protect agriculture and open space and minimize sprawl is an available and feasible mitigation measure that should be included in a revised General Plan and RDEIR to substantially reduce impacts of the Plan.

In response to these concerns, Tulare County Citizens for Responsible Growth (TCCRG) recommends a number of major concept revisions to the General Plan which will ensure a more compact urban form as the County grows and which will serve to mitigate environmental impacts to a substantially greater degree than that proposed in the RDEIR:

# Tulare County Citizens For Responsible Growth

## Major Concepts: TCCRG Proposed General Plan Revisions and Mitigation Program

- |  |               |
|--|---------------|
| <p><b>1. <u>Require</u> Consistency with incorporated City Plans and Efficiency of Growth in Unincorporated Communities to Promote Compact Development Form.</b><br/><b>To accomplish this, eliminate CACUABs and CACUDBs in favor of City control of their growth areas coupled with equitable revenue sharing.</b></p> <p>a. Eliminate the CACUABs and replace with agricultural designations.<br/>This area is not needed to support the County's growth projections for the GPU horizon, and should be protected as urban/rural separators/buffers.</p> <p>b. Ensure that urban development takes place in the following areas only:<br/>Within incorporated cities and their designated growth areas as they annex,<br/>Within UDBs of adjacent cities in other counties,<br/>Within UDBs of unincorporated communities and HDBs of Hamlets after they are sized for modest, compact healthy growth appropriate to each of these locations. (See 2b below.)</p> <p>The intent is to eliminate County approved urban development in the City UDBs (other than under existing zoning requiring no new parcelization or use permits) and to promote efficient non-sprawling development in the unincorporated communities and hamlets. This would be more cost effective for the taxpayers and allow the cities to deal with orderly resource-efficient growth in the areas to which they would be eventually providing infrastructure and services.</p> | <p>I23-8</p>  |
| <p><b>2. Eliminate "Anything Goes" Features of the Plan. No Growth Corridors or New Towns.</b></p> <p>a. Eliminate the proposed Growth Corridors and Planned Communities (New Towns) in the unincorporated area.</p> <p>b. Create Hamlet Development Boundaries (HDBs), unincorporated community boundaries (UDBs), and land use designations within them only after specific land use plans are inclusively created for each which clearly locate land uses of an appropriate scale of neighborhood, commercial, and non-residential uses, developed only concurrent with the provision of needed infrastructure and developer mitigation fees, and which are consistent with Development Efficiency Targets.</p>   | <p>I23-9</p>  |
| <p><b>3. Protect Agriculture and Open Space –<br/>Use Development Efficiency Targets to Protect Agriculture and Open Space, Reduce Sprawl, and Require Agricultural and Open Space Conservation Easements</b></p> <p>a. Require a system of Development Efficiency Targets, such as the ones proposed by the American Farmland Trust in their 2007 Comment Letter (attached), before a UDB or HDB is revised and before any individual discretionary land use development project, policy, or program is approved.</p> <p>b. Revise the agricultural and open space conservation easement policies to require that when developments are approved that will result in the loss of prime, important, or unique agricultural or open space, a fee will be assessed sufficient to purchase agricultural and open space protection easements of equal value elsewhere in the county, at a minimum ratio of 1:1.</p>  | <p>I23-10</p> |
| <p><b>4. Adopt the Healthy Growth Alternative – Revised Alternative 5.</b></p> <p>We continue to support a Healthy Growth Alternative which incorporates the measures above and <u>ensures</u> an 80% (or greater)-20% city/county growth scenario. This alternative is a revision of Alternative 5, the Confined Growth Alternative, which is considered the Environmentally Superior Alternative by the RDEIR. With the revisions we have recommended, this alternative would remain environmentally superior and would fully meet all of the General Plan Project Objectives.</p>   | <p>I23-11</p> |

# Tulare County Citizens For Responsible Growth

## ♦ Efficient Development Patterns Needed.

The most assured way to promote compact urban form and protect agriculture and other important open spaces is to ensure that most of the growth in the county will occur within the existing and future City limits, under control of the cities. In order to achieve this goal, the County land use designations and zoning in the UABs and UDBs surrounding the cities must be exclusively agricultural and open space so that development will be encouraged within the cities and their development expansion areas. The experience throughout California is that this will simply not occur if urban development is permitted under two different jurisdictions, with developers competing for suburban densities over urban densities, lower fees, and less urban infrastructure requirements. It certainly will not occur under the weak CACUAB and CACUDB policies in the Planning Framework.

I23-12

Additional growth is appropriate and needed in the unincorporated communities and hamlets. Such growth will not result in sprawl, however, if long-term planning boundaries firmly limit the circumstances under which they can be expanded. The Plan does not accomplish this, since it establishes significantly oversized UDBs and HDBs around the communities and hamlets and permits an interim allowance of “anything goes” Mixed Use” land use. In addition, the GPU policies create far too many opportunities for the UDB to be changed anytime there is a subdivision proposal, or potential “financial benefits” to the county, or even “any other relevant factor considered on a case by case basis.” This is no more than the market driven approach roundly criticized in the 2008 Draft general Plan Update, without a name. The result is that the Urban Development Boundary and Hamlet Development Boundary are no boundaries at all. We recommend that the proposed development boundaries around the communities and hamlets not be delineated in the General Plan Update. A General Plan amendment should be required for any establishment of these development boundaries in addition to an amendment to the community or hamlet plan (if one has been adopted). The focus of these plans and boundaries should be on revitalization of existing urbanized areas before allowing greenfield development, especially in areas that lack adequate infrastructure and reliable water supplies.

I23-13

Consistent with our previous recommendations, we also support the American Farmlands Trust proposed Development Efficiency Targets. Such a policy has two benefits: (1) it will minimize the conversion of lands important for agriculture and natural resources by ensuring that every acre is used efficiently; and (2) efficient development fosters a built environment that is more conducive to economically sound development patterns, making communities more attractive to both investors and residents by emphasizing mixed-use, and promoting pedestrian, bicycle, and public transit services, which in turn promote better health, lower pollution and GHG emissions, a feeling of community, and overall better quality of life.

I23-14

## ♦ Planned Community Areas, New Towns and Growth Corridors Negate the Concept of Compact Urban Form and Farmland Protection.

The Planned Community (formerly called New Town) and Growth Corridor concepts furthered in the General Plan fundamentally undermine its Guiding Principles within the Planning Framework which emphasize avoiding rural residential sprawl and protection of important agricultural resources, and it directly contradicts the priorities of the citizens of Tulare County. In effect, this provision encourages the building of entirely new towns by failing to establish any specific, measurable standards for when such a

I23-15

# Tulare County Citizens For Responsible Growth

massive undertaking might be “justified” by unspecified and unlimited “circumstances” that “should be judged on their individual merits.” (PF-5.1) This vague language leaves the door to “leapfrog” development wide open. A New Towns provision is no longer needed or justified: planned communities can easily be accommodated within existing development boundaries, Tulare County citizens want growth focused in existing communities, and they don’t want new towns.

I23-15  
cont'd

As reported by the County’s own consultants, the County’s existing cities, communities and hamlets already offer more than enough land within their existing development boundaries to accommodate 50 years worth of growth at current densities; more than that at higher densities. Moreover, existing urban areas can more efficiently expand their infrastructure to support such growth at a much lower cost than would be required to establish entirely new roads, water and power systems, public safety facilities, schools, etc.

I23-16

The County’s existing urban areas should be permitted to grow and provide whatever “benefits” any new town could provide. Instead, the New Town and Growth Corridor policies force Tulare County’s cities, hamlets and communities to compete with undeveloped land for investment dollars. While infill development may be more of a challenge to developers, it can also be ultimately more rewarding, as property values rise as a result of their development. Infill development also benefits the entire community – not just a particular development – as older downtowns revitalize, attracting new businesses and good-paying jobs, and bringing much-needed revenue to improve aging infrastructure.

By inviting New Town development in the guise of Planned Community Areas, Tulare County is putting its existing communities at a competitive disadvantage and jeopardizing their chances of getting the investment they need. This growth-inducing policy will also invite sprawl; worsen air quality; increase traffic problems; accelerate loss of agricultural lands, wildlife habitat, open space, and scenic views; result in higher costs and greater inefficiencies because of failure to utilize existing services, facilities, and infrastructure; and increase pollution and GHG emissions unnecessarily – to the detriment of the quality of life of all Tulare County residents.

The RDEIR has not examined the impacts of New Towns. Of particular concern is their potential impact on existing communities. The assumption that the criteria listed in the General Plan for New Town review assures they will not cause substantial impact is speculative at best and inappropriately defers this important subject to further study. As explained above, it is likely that creation of New Towns in Tulare County would result in significant adverse impacts on existing communities, many of which already suffer from lack of adequate infrastructure and public services. Moreover, the County must specifically define the conditions under which New Towns may be considered justified. The rules should be defined during the General Plan Update process, not tailor-made for each individual project at the time the project is proposed for approval.

I23-17

We recommend that this policy be removed altogether and that New Towns be prohibited instead as there is NO NEED for New Towns, and County citizens have said they don’t want to see the development of, entirely new towns.

I23-18

We have a similar concern with the proposed Regional Growth Corridors. Many miles of the County’s highways in the unincorporated area could be developed under these policies, and without a plan! Policy C-1.6 permits development in these corridors (which are unspecified) before a plan is developed and with minimal criteria. The RDEIR has not demonstrated how these minimal criteria would mitigate potential

I23-19

# Tulare County Citizens For Responsible Growth

impacts. If the locational criteria are met, a substantial amount of commercial and industrial development could be allowed, in competition with existing urbanized areas, similar to the impacts of New Towns as described above. Permitting development of these Growth Corridors simply is not consistent with numerous policies in the General Plan intended to attempt to encourage (though, regrettably not to require) a compact urban form. Certainly, the visual impacts could be substantial; this impact has not been adequately discussed in the RDEIR. We recommend that the GPU be revised to prohibit the development of these Growth Corridors and to focus such development in the urbanized areas that could support and benefit from it.

I23-19

## II. Additional Detailed Comments on RDEIR Adequacy

Our detailed comments on the adequacy of the RDEIR follow.

### ♦ Project Description flawed.

#### **Buildout of the Plan not quantified.**

##### **Land Use Diagram not complete.**

The Project Description is fatally flawed in that the General Plan and the RDEIR never illustrate or quantify what the project actually adds up to. State law requires that: "A land use element designates the proposed general distribution and general location and extent of the uses of the land for housing, business, industry, open space, including agriculture,... and that it *"include a statement of the standards of population density and building intensity recommended for the various districts."* and other territory covered by the plan." (Government Section 65302 (a). These basic requirements are not met in the General Plan Update making it also impossible to set forth an adequate project description in the RDEIR. *"An accurate, stable, and finite project description is the sine qua non of an informative and legally sufficient EIR."* (San Joaquin Raptor/Wildlife Rescue Center vs. County of Stanislaus, 1994.)

I23-20

There is no buildout chart in the General Plan Update or in the RDEIR. General Plan Table 4.1 outlines densities permitted in the various land use designations and where they are allowed. However, there is no tabulation of how many acres of each designation have been allocated and how many acres are vacant or underutilized in each category. This information must be provided, and then be used to multiply permitted densities by acreage and determine both a 2030 buildout and an ultimate holding capacity. Without this information, we cannot determine the most basic question: Has too much land been slated for urbanization, resulting in impacts greater than necessary?

I23-21

In addition, the land use designations are not shown on the Tulare County Planning Areas map (GPU/GPR Figure 4-1, p 4-5). The various community plans and area plans are incorporated by reference. Yet, one-third of the unincorporated communities and none of the Hamlets and MSCs have adopted plans. As a result, there are many areas that simply have not received land use designations more detailed than a Planning Framework boundary. (The UABs are an example.) A policy framework cannot meet the requirements of State law for what should be the simplest part of the General Plan for a citizen to understand: its illustration - the Land Use Map. The Land Use Map is the portion of the General Plan that in the future will receive the most use. After the policies become a bit dusty, the Map will be used on a daily basis. A citizen cannot look at the General Plan Update Land Use Map in its current condition and

I23-22

# Tulare County Citizens For Responsible Growth

determine what land uses are permitted in the UABs, the Growth Corridors, the Hamlet UDBs, and many other areas of the county. | I23-22 cont'd

Without a complete Land Use Diagram and buildout calculations, numerous critical questions cannot be answered: | I23-23

- What is the potential 20 year buildout population if the entirety of the UDBs, HDBs, and MSCs were to build out?
- The RDEIR relies on a population growth projection as the core of the Project Description (RDEIR page 2-24) with no spatial component other than a determination that State growth projections and traffic modeling led to a determination that the unincorporated area could accommodate 25% of the growth. (RDEIR page 2.24, para 3). How much more could the unincorporated area within the UDBs and HDBs actually accommodate? Could the Plan prediction of a 75%-25% city-county growth ratio expectation be exceeded by growth in the unincorporated areas of the county, as allowed by these UDBs and HDBs?
- The myriad of specific plans and area plans which make up the Land Use Map have not all been quantified as to 2030 or full buildout potential. What is the true total buildout potential in the unincorporated areas?

The RDEIR Project Description goes on to very generally conclude that future growth assumptions are consistent with “several” of the Update objectives (RDEIR page 2-24). In fact, the RDEIR Project Description fails to mention that numerous Planning Framework policies are actually worded counter to the argument that 75% of the new growth is expected to occur in cities. As an example, PF-4.24 notes that the County “may” (and, thus, we assume may not) refer development proposals to the cities for annexation. The RDEIR simply ignores the difficult but essential task of determining specifically where growth actually could occur based on the General Plan Land Use Map proposed. | I23-24

In addition to lack of figures for the year 2030 buildout, the RDEIR does not answer the question: What is the full population capacity of the Land Use Diagram, including the vast 50 year UABs and the various Mixed Use areas which could permit up to 30 dwelling units per acre? The maximum density permitted in each land use category by the General Plan must be evaluated to understand its full impact potential. As discussed previously, State General Plan law requires that all general plans specify the density and intensity permitted on all lands within the plan. To determine full buildout potential, the Plan and the RDEIR would need to multiply acreage of each land use type by the density and intensity permitted to complete RDEIR Table 2-10 (GPU Table 4.1). Clearly, it was assumed by the State via General Plan law that full density and intensity could occur (Government Code Section 65302 (a)). Certainly, the experience of land use in California is “if you zone it, they will come.” | I23-25

Thus, the question remains, what are the impacts of the plan? Without an accurate Land Use Diagram, and its quantification, most of the Plan’s impacts cannot be accurately determined, and many can hardly be guessed at. | I23-26

An understanding of 2030 and ultimate capacity buildout potential could lead to advisable, quantifiable mitigation such as restrictions on the timing of growth, reduction of growth areas, adjustment of densities, etc. The RDEIR and the GPU are not legally adequate without an understanding of the Project Description | I23-27

# Tulare County Citizens For Responsible Growth

which must include full buildout of the General Plan Update both in population and spatially in 2030 and at full capacity.

I23-27  
cont'd

## **Confusing Land Use Diagram – What Is the Plan?**

The Project Description as well as the GPU are also inadequate because of the confusing land use designation system developed (RDEIR page 2-21). Existing community plans, area and sub-area plans, and county adopted city general plans are listed and incorporated by reference. However, a citizen would need to find the land use maps in these plans to piece together an understanding of the whole. The GPU goes to the extent of including numerous maps delineating the boundaries of these plans, but not the land use designations within them. In addition, the remainder of the County includes vast areas (in UABs, HDBs, Growth Corridors, and Community UDBs) that do not have specifically assigned designations; they are designated Mixed Use over a large area or they are retaining existing General Plan designations which may or may not be consistent with the policies of the General Plan Update.

I23-28

## **◆ Numerous critical policies and measures are so vaguely worded that mitigation simply cannot be assured.**

The draft GPU provides future elected officials with too little real guidance, and the people of Tulare County with too little assurance, that their vision for the County's future will be protected. We need a General Plan with strong, clear, enforceable policies and concrete, trackable, timely implementation measures.

I23-29

The GPU states that a policy is “a statement that guides a specific course of action for decision-makers to achieve a desired goal. The County has strived to develop clear and unambiguous policies” (GPU Part I, page 1-8). The Goals and Policies Report (GPR) goes on to state that the GPR is the “essence” of the General Plan and that it “identifies a full set of implementation measures that will ensure the goals and policies in the General Plan will be carried out.” Finally, the GPR states that an implementation measure is “a specific measure, program, procedure, or technique that carries out plan policies” and that “Implementation measures describe actions that are measurable so their completion can be easily monitored in annual reports” (GPU, Part I, page 1-11).

Unfortunately, the GPU fails to meet its own standards in many respects. Many of the policies are far from specific, clear, and unambiguous, and many have no identified corresponding implementation measures. Many of the implementation measures that are provided are so vague as to be neither measurable nor enforceable; many state that they are “new,” yet indicate for their timeline that they are “ongoing,” so that one cannot determine whether they are supposedly already being implemented (in which case the date of actual implementation should be shown) or when one could expect them to be in force; others are scheduled to be commenced so far in the future that it is doubtful that much in the way of meaningful outcomes can be made to result from them within the life of the General Plan Update. Many implementation measures are cited in the RDEIR to serve as mitigation. However, the definition of implementation measures in the General Plan Update (see GPU/GPR page 1-11.) weakens the ability of these measures to effectively mitigate impacts. For example, timelines are considered “general guidelines” and “completion of various tasks... are subject to available staff, financial resources, and other considerations” (see GPU/GPR page 1-11.).

# Tulare County Citizens For Responsible Growth

As an example, the General Plan Update's foundation is a series of policies and measures which purport to limit sprawl and haphazard growth which is the source of many adverse impacts of growth including loss of agriculture and open space, reduction in quality of public services and facilities, reduced air quality, and increased traffic, VMTs, and GHGs, etc. And yet, these very policies and measures are not required to be carried out in the General Plan Update which uses weakly directive terms such as "may" or "should" or "encourage." As a result, the impacts resulting from the buildout pattern permitted by the General Plan cannot be expected to be mitigated below the significant level. The foundation on which the Plan rests is simply not firm. | I23-30

An EIR must provide substantial evidence demonstrating that the recommended mitigation measures are capable of: *"(a) avoiding the impact altogether by not taking a certain action or parts of an action; (b) minimizing impacts by limiting the degree or magnitude of the action and its implementation; (c) rectifying the impact by repairing, rehabilitating, or restoring the impacted environment; or (d) reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action. (CEQA Guidelines §15370.)* The RDEIR must use these tests to analyze whether or not the language "may" or "should" and other language which may weaken the actual implementation of policies and measures will actually result in effective mitigation. We argue that it will not, because the decision makers will not be required to carry out the underlying intent and the decision will be left to the whims of politics. | I23-31

As an example of ineffective mitigation wording, the General Plan Update Planning Framework policies are cited throughout the RDEIR chapters as mitigating in nature. A system of concentric growth boundaries around the cities and various unincorporated areas and a series of associated policies purporting to focus most growth in city spheres of influence and urban development boundaries form the Planning Framework (General Plan Update Part I, Chapter 2). The RDEIR claims that these policies will serve to limit sprawl, preserve agriculture to some degree, reduce traffic and air quality impacts, and more. However, as discussed above, the vague wording used in most of these policies will not ensure that these concepts are carried out; in other cases the concepts themselves are flawed (such as that the UABs will serve to focus growth) and will not reduce sprawl.

For instance, the General Plan Update sets forth a basic program in its Planning Framework that it claims would focus growth largely in the existing cities. To do this, the General Plan Update claims that it will rely on the City General Plans for these areas. However, the policy enacting this program does not require that it be carried out: | I23-32

***PF-4.8. General Plan Designations Within City UDBs.***

*On land that is within a CACUDB, but outside a city's incorporated limits, the County may [emphasis added] maintain General Plan land use designations that are compatible with the city's adopted General Plan.*

In addition, the policy which discusses how land use proposals submitted to the County in the areas just outside the cities (CACUDBs) will be handled does not require that land use proposals be referred to the cities for potential annexation, leaving no teeth in the policy:

***PF-4.24 Annexations to a City within the CACUDB***

*In addition to the County's current policies on development within a CACUDB, the County may [emphasis added] work with a city to provide that urban development projects within a city's*

# Tulare County Citizens For Responsible Growth

*Sphere of Influence (SOI) as set by the Tulare County Local Agency Formation Commission will be referred to the affected city for consideration of annexation.....* | I23-32 cont'd

The second concentric growth boundary circle proposed around the cities is an Urban Area Boundary (UAB), intended to provide for 50-year growth. The GPU claims that this area will be limited in growth, and planning will be coordinated with the cities. However PF-4.1, establishing the UABs around cities, states only that: *“the cities’ concerns may [emphasis added] be given consideration as part of the land use review process...”* In addition, this policy states that this area *“will generally have an agricultural land use designation or rural residential land use designation...”* Yet the rural residential designation can include rural ranchette 10 acre parcels (General Plan Table 4.3 - Countywide Land Use Designation Matrix) which is an inefficient parcel density counter to efforts to preserve agriculture and reduce sprawl. In addition, the Rural Valley Lands Plan is only advisory in the UABs. The policies attempt to allow some additional control by the County in these areas, but the wording used only notes that the County “may” work with individual cities to ensure that the RVLP policies apply in these areas (PF- 4.19, PF-4.21). In fact, the RDEIR admits in the Agricultural Resources section that development per the GPU in the UABs and HDBs will result in loss of up to 59,645 acres of important agricultural land (RDEIR Table 3.10-9), a significant “unavoidable” impact. | I23-33

The ability of the General Plan Update to limit sprawl is further weakened by the fact that unincorporated hamlets may be expanded substantially (PF-3), that New Towns (Planned Community Areas) may be formed (PF-5.1), and that Regional Growth Corridors (C-1.6) will be created. In addition, until plans are prepared for the Hamlets, Growth Corridors, and Community UDBs, the underlying land use designation is Mixed Use, which as defined in the General Plan Update permits an “anything goes” type of planning. Up to 30 units per acre of residential use are allowed and any type of commercial use is allowed, with only vague direction given: *“The consideration of development proposals in Mixed Use areas should [emphasis added] focus on compatibility between land uses, and the development potential of a given area compared to the existing and proposed mix of land uses and their development impacts.”* (General Plan Update Part I, page 4-20). The creation of these growth areas, located generally in the middle of agricultural areas, is inconsistent with the Planning Framework, and the wording in the policies guiding their review is so permissive as to be ineffective, not serving to mitigate any potential impact. | I23-34

Further, the General Plan Update does not require that the County, in permitting development within the CACUDBs and CACUABs, to conform to City infrastructure standards, public service level of service targets, or fee structures. (See policies PF-4.2 and PF 4.27.) Without equal standards and fees, developers will pit the County against the City and generally choose to develop where they are the lowest. And, under GPU policies, a project can be developed under County jurisdiction and not be required to annex to the city at a future date. (Policy PF 4.24d) | I23-35

The actual impact of these weakly worded Policy Framework policies and permissively worded growth plans in the form of New Towns (PCAs), Growth Corridors, and Hamlet and Community development boundaries would be the opposite of what is claimed in the RDEIR, resulting in heightened impact levels and inadequate mitigation. Under these Planning Framework policies, a proposed project in an unincorporated area can be referred to a city, denied annexation by the city at that time for appropriate reasons (such as inconsistency with their general plan or untimely development), yet can then be approved by the County with a potentially inconsistent land use density, with infrastructure that does not meet City standards, and under fees that will not provide for urban public facility levels of service. In addition, the | I23-36

# Tulare County Citizens For Responsible Growth

project may never be required to annex to the City in the future (which would be the only remaining way to eventually create a consistent buildout pattern in the area in question).

I23-36  
cont'd

There is a pattern of wording of these policies that makes it clear that the County may not truly be interested in a compact, resource-efficient urban form; there are loopholes in almost every relevant policy allowing the County to ignore City zoning and standards. And, there are loopholes which would permit extensive growth outside the cities. Rather than extensively revise the policy wording, it would be more effective as mitigation to eliminate the UABs, require the County to designate the city UDBs agricultural with urban plans to be implemented by the cities in this area, prohibit the New Towns PCAs) and Growth Corridors, and revise the hamlet and community boundaries as we have recommended earlier in this letter.

Weakly worded mitigating policies and implementation measures are found throughout the RDEIR and the GPU. They must be rewritten to assure effective mitigation and a legally adequate EIR.

## ♦ Not all available and feasible mitigation is explored in the RDEIR.

I23-37

An EIR must explore all available feasible mitigation measures even if they are not selected (*CEQA Guidelines § 15091(a)(c)*) and *Stevens v. City of Glendale (1981)*.) In some cases, the RDEIR "drops the ball" and concludes that an impact is unavoidable when, in fact, mitigation measures may be available. Feasible mitigation measures must be identified even if they do not fully mitigate impacts in an attempt to reduce impacts to the greatest degree feasible, even if an alternative approach would impede to some degree the attainment of the project objectives, or would be more costly. (*CEQA Guidelines § 15126.6(b)*).

Throughout these comments on the RDEIR, we point out mitigation measures which have not been explored and which will provide greater mitigation than that provided in the RDEIR. The RDEIR must be revised to explore all such measures and adopt them when determined to be feasible.

## ♦ Existing Setting description inadequate.

I23-38

There is no totaling of potential buildout under the existing General Plan or zoning in either the RDEIR or the General Plan Update. The General Plan Update Background Report does include a number of charts with some totaling of zoning or general plan designations by acreage and some population projections: Chapter 3 includes charts that total existing acreage zoning by category for the Rural Valley Lands Plan, Kings River Plan, the Foothill Growth Management Plan and the Mountain Planning Regions sub-areas. However, buildout calculations are not presented and cannot be determined by the reader since acreage is not identified as developed or undeveloped. The community plans have the most existing land use designation data presented (General Plan Update Background Report Table 3-6). However, the population projections are only for the plan period, not the full buildout potential, which cannot be determined by the reader with the data presented. Some of this information is available in individual adopted plans, but in total there is no way to determine what the existing County General Plan permits. Since the General Plan buildout calculations of the incorporated areas of the cities are not presented, the true existing buildout potential of the entire county cannot be understood.

# Tulare County Citizens For Responsible Growth

From a CEQA standpoint, without a knowledge of the buildout potential of the existing General Plan, it is impossible not only to understand the existing setting, but also to compare it to the proposed General Plan Update in the alternatives section of the RDEIR. And, clearly, it was not available during the creation of the proposed Land Use Diagram to inform decision making. It appears that the existing City Plans with modest expansion room into the UDBs alone could provide for all the growth projected for the County to 2030.

I23-38  
cont'd

## ♦ Land Use and Aesthetic Impacts

**Division of the physical arrangement of an existing community discussion and mitigation inadequate (Impact 3.11).** This impact discussion again relies on policies which cannot be assured of mitigation because of vague wording such as: “The County *may [emphasis added] ensure proposed development within CACUABs is compatible with future...circulation networks as shown in city plans*” (PF Policy 4.12) and the County “may” require a development project to meet the County adopted city development standards of the city in question (PF Policy 4.10). (Other examples include PF Policies 4.6, 4.8, 4.9, 4.13.)

I23-39

The General Plan Update maintains that the outer ring of development around the cities, the CACUABs will generally have an agricultural or rural residential land use designation (Policy PF-4). Yet Rural Residential land uses are permitted; these ranchette type densities run counter to the goal of reducing rural residential sprawl cited in the Guiding Principles. This remains a potentially significant impact which would best be mitigated by elimination of the CACUABs and assignment of agricultural zoning only in these areas.

However, of most concern related to dividing the physical arrangement of an existing community (which we assume is the current built form of the county) is the structure providing for “Planned Communities” (formerly called New Towns) and Growth Corridors within the General Plan Update, which has been discussed previously in this letter. Though these land use designations have not been specifically located yet, they clearly have the potential to alter the urban, suburban, and/or rural form of Tulare County. Implementation measures outline planning issues which must be addressed in these plans; however clearly, the magnitude of these entirely new growth areas has the potential for significant impacts. In the case of the Regional Growth Corridors, which could extend along much of the major highways in the County (RDEIR Figure 2-1), highway oriented commercial, industrial, and mixed use development may be approved by the County immediately, pending adoption of Regional Growth Corridor plans (Policy C-1.6). The Planned Communities must be at least 200 acres in size. The RDEIR does not discuss the potential for these new land use concepts to alter and divide the built form of the county. We maintain that impacts are unavoidable because of the magnitude of what is proposed and diversion from the current built form of the unincorporated County, regardless of the future planning that may be involved.

The RDEIR is inadequate without a discussion of these issues and incorporation of the available and feasible additional mitigation recommended.

**Conflict with other adopted land use plans discussion and mitigation inadequate (Impact 3.1.2).** The RDEIR concludes that this impact is less than significant, in part because “*policies in the Planning Framework are specifically designed to direct urban development within UDBs of existing cities, communities, and other County planning areas to ensure that all development is well planned and adequately served by infrastructure*” (RDEIR p. 3.1-23). However, again, a number of the policies cited as mitigation in this section include vague language which will not ensure implementation. For example,

I23-40

# Tulare County Citizens For Responsible Growth

PF-4.8 notes only that the County “may” maintain General Plan designations that are compatible with the City’s adopted general plan. In policy PF-4.13, it is recognized that if the City is not ready to annex a property in a UDB, the County can permit development if it determines that it is not incompatible development. Similarly, in policy PF-4.10, the County states only that it “may” require a development project to substantiate sufficient water supply and meet the County adopted city development standards of the city in question. And per policy PF-4.12, the County “may” (or may not) ensure that proposed development within CACUABs is compatible with future sewer and water systems, and circulation networks as shown in city plans.

I23-40  
cont'd

Numerous other Planning Framework policies cited as mitigation in the RDEIR will not, because of their non-directive wording, ensure implementation of City plans. (Other examples include PF 2.2, 2.3, 4.1, 4.2, 4.5, 4.6, 4.9.)

The conclusion of less than significant relative to conflict with other adopted land use plans cannot be reached without the revision of these and related policies to include directive language such as “shall” or “must.”

## ♦ Impacts to Agricultural Resources

### **Not all available agricultural impact mitigation is explored.**

I23-41

#### **Land Use Map revision needed.**

As discussed previously, the RDEIR does not explore all available mitigation as required by CEQA. This is particularly evident in the Agricultural Resources impact section. Rather than explore possibilities for effective mitigation, the RDEIR, by concluding that 59,645 acres of farmland may be lost under General Plan buildout “drops the ball” by neglecting to explore effective mitigation and concluding that impacts are unavoidable. Only one mitigation measure is added, and it does not even require action: *“The County shall consider (emphasis added) the implementation of an Agricultural Conservation Easement Program...”* (Agricultural Element Implementation Measure #15).

The most obvious way to reduce loss of agriculture to urban uses is to simply revise the Land Use Map, which the RDEIR fails to discuss. Elimination of all or part of the city CACUABs alone could retain up to 49,600 acres of farmland according to the RDEIR’s own figures (RDEIR Table 3.10-9). Even assuming that existing sprawling Rural Residential zoning is retained in these CACUABs, a substantial amount of farmland would still be preserved. UDBs around the unincorporated communities, Hamlet HDBs, and Growth Corridors could also be decreased in size. Combined with the Development Efficiency Targets discussed below, it is expected that the target population of the County could still readily be accommodated in this decreased urbanization area and impacts related to loss of agriculture and open space could be reduced below the significant level.

#### **Efficiency of development needed to reduce sprawl.**

Other mitigation options have been suggested which were not explored in the RDEIR. The American Farmland Trust (AFT) in their comments has recommended a Development Efficiency Target review system. Again, the RDEIR concluded that approximately 59,645 acres of agricultural land could be lost by

I23-42

# Tulare County Citizens For Responsible Growth

2030 under buildout of the General Plan Update. The American Farmland Trust estimated in 2007 that if the efficiency of development were increased to the Valley-wide average of 8 people per acre, only 23,675 acres would be needed to accommodate growth through 2025; and if it were increased to 15 people per acre, roughly comparable to the prevailing average in the Bay Area and urban Southern California, only 12,625 acres would be needed – less than 20 percent of the land currently planned for development (AFT, 2007 comments attached). Clearly, the AFT proposal would increase the efficiency of development and reduce overall per capita land consumption. This system is set forth below and should be evaluated and included as mitigation in the RDEIR in addition to Land Use Map changes:

I23-42  
cont'd

## ***Add PF 1.1a: Development Efficiency Targets***

### ***Efficient Development to Minimize Agricultural and Other Resource Land Conversion***

*The County shall promote efficient development that minimizes the conversion of agricultural land and other resources by adopting and applying Development Efficiency Targets in making future land use decisions affecting agricultural and open resource land. The County shall establish Targets for average residential density and commercial floor-to-area ratios (to be applied to public projects as well as private development), based on the amount of land to be dedicated to these uses, the projected population and the goal of limiting future urbanization of agricultural and other open land within the County (including those portions within cities) to not more than 16,000 acres through the year 2030. (This implies an average development efficiency of about 12 people per acre over the period, almost three times the current trend in Tulare County.)*

*The County shall use these Targets (and encourage cities to use them) to evaluate existing spheres of influence and urban development boundaries, existing zoning districts, rezoning petitions, community and specific plans, new town proposals (PCAs), agreements with cities that would expand their spheres of influence or urban development boundaries, and all new development projects within the unincorporated area of the County that are not already part of a community or specific plan. Such evaluations shall include specific findings, to be made available to the general public, that quantify any deviation of the efficiency of the development that is or would be authorized from the applicable Development Efficiency Targets.*

*The County shall also identify obstacles to increasing the efficiency of urban development and shall adopt (and encourage cities to adopt) changes in policies, zoning, rules and incentives to enable and encourage all communities (urban and urbanizing areas) to meet Development Efficiency Targets.*

## **Ineffectual wording of policies and measures must be eliminated.**

Finally, as throughout the General Plan Update, most of the agricultural resource policies are weakly worded with little potential for effectiveness because of their permissive wording, using terms such as “encourage,” “consider,” or “may,” or “should”. An obvious method of decreasing loss of agricultural land would be to fortify the wording of these policies and measures.

I23-43

For instance, the Conservation Easement Program recommended in the General Plan update is just that, only a recommendation: Policy AG-1.6 “*The County may (emphasis added) develop an Agricultural Conservation Easement Program...*” Both Implementation Measures 1 and 5 are intended to follow up on this policy. Yet they are too vague to be measured or enforceable; they should be made specific with a

# Tulare County Citizens For Responsible Growth

required land replacement ratio and given a deadline for establishment of the mitigation program. (I.M. 1: “The County shall take the lead to work with the cities and Tulare County Association of Governments (TCAG) to establish a comprehensive agricultural land mitigation program...” I.M. 5: “The County shall work with TCAG and the cities to establish criteria for the locations for agricultural conservation easements.”) Taking the lead does not ensure that a program will be adopted. If the land replacement ratio is not specified at this time, mitigation cannot be assured.

I23-43  
cont'd

Conservation easements are the last line of defense in an effective agricultural protection hierarchy: 1. Protective land use designations, 2. Clustering of growth to avoid sprawl, and finally - 3. Purchase of agricultural conservation easements on similarly valued agricultural land to mitigate the loss that still occurs after the first two steps are implemented.

The RDEIR concludes that a variety of other policies will assist in reducing conversion of agricultural lands to urban uses (table on RDEIR page 3.10-14). However, as discussed previously, most of these policies include language which does not require their implementation. In order for these policies and measures to result in any degree of mitigation, their wording must be strengthened.

**Williamson Act contracts need greater support.** Contracts for lands within UDBs are currently reviewed every five (5) years to determine whether any community is unduly restrained in its growth by the existence of an agriculture preserve. The County initiates the non-renewal process if a property is found to be inhibiting urban growth, and the contract is allowed to lapse at the end of its term. This existing procedure is more than adequate to protect the interests of both the urban community and the agricultural user. The following proposed amendment to AG-1.4 would ensure that Williamson Act contracts on land within UDBs or HDBs are not earlier cancelled or non-renewed unless requested by the landowner, thus preventing premature conversion of land from agricultural to other uses before the natural expansion of the urban center would require it, and simply because the land had become enveloped by a UDB or HDB.

I23-44

We suggest the following policy revisions:

***AG-1.4 Williamson Act in UDBs and HDBs:*** *The County shall support nonrenewal or cancellation processes ~~that meet State law for lands within UDBs and HDBs~~ for lands within UDBs and HDBs only after it has developed and adopted Development Efficiency Target standards that must be adhered to in exchange for supporting Williamson Act cancellations and non-renewals in HDBs and UDBs.*

**Limits on Ranchettes Still Not Mitigated.** We support the concept of limiting ranchette development, but the General Plan policy has no supporting implementation measure, which renders it meaningless. We suggest that this policy be revised to read:

I23-45

***AG-1.12 Ranchettes:*** *The County shall ~~discourage~~ not allow the creation of ranchettes in areas designated Valley Agriculture and Foothill Agriculture.*

***New policy recommended:*** *Division of agricultural lands shall not be permitted unless the Agricultural Commissioner / Sealer – Weights & Measures finds that the resulting parcels can be viably farmed.*

# Tulare County Citizens For Responsible Growth

**Summary- RDEIR inadequate without evaluation of all available and feasible agricultural land loss mitigation.** In conclusion, the measures discussed above must be evaluated in order to make a more adequate meaningful effort to explore all available feasible mitigation consistent with the requirements of CEQA. While impacts to agriculture may still be significant, they will be greatly reduced using these measures; these measures should be adopted to promote the greatest degree of mitigation possible. As the project proponent, if the County feels that these measures are infeasible, it is the County's responsibility to document the reasons, rather than simply dismiss the measures. It is not appropriate for the County to simply throw up its hands at the magnitude of the task that preserving agriculture and open space presents.

I23-46

## **Not all agricultural impacts are discussed.**

I23-47

A number of impacts related to agricultural resources were not discussed in the RDEIR:

### **Economic impacts not discussed.**

The figures in the 2008 General Plan Update compared with those in the 2010 General Plan Update show that over 5,000 acres of Prime Farmland were converted from 2004 to 2006. The RDEIR must answer the question: what are the economic impacts of agricultural land conversion and the continuing trend predicted in the RDEIR? An EIR must discuss the economic impacts of a project to the extent that they could result in physical impacts. Agriculture is the economic engine of Tulare County. Certainly, in the case of the General Plan Update, economic impacts could result in loss of jobs and related blight impacts in individual communities due to vacated homes and businesses, and loss of tax revenue leading to reduced public facility levels of service

### **Animal confinement facilities not discussed.**

I23-48

Animal confinement facilities (dairies, feedlots, etc.) are a major component of agriculture and the economy in Tulare County, and milk is far and away the County's single leading commodity. The County's failure to substantively address these facilities in the General Plan Update/RDEIR documents constitutes a major omission and detrimentally limits the public's understanding of the importance of animal confinement facilities to existing conditions in the County, related environmental impacts, and the adequacy of the County's related policies and implementation measures and mitigation measures. The new Climate Action Plan points out that 63% of the GHG emissions in the unincorporated area of the County are from dairies and feedlots (the next largest source is Mobile Sources, at 16%). The County must revise the General Plan Update and the RDEIR to include substantially more information related to this key subject, in proportion to its importance to all these aspects of the General Plan. To simply state that the County has a Plan, which is incorporated by reference, gives the public no understanding of the history, challenges, and problems associated with this Plan, which is still being worked on. Without a detailed analysis of the impacts of animal confinement facilities, this General Plan Update is inadequate by failing to examine and disclose the potential significant adverse environmental impacts of a major component of the County's land use, agriculture, and economy, affecting air quality, water supply and quality, Greenhouse Gas emissions, soil, flora, fauna, public health (and, in some cases, scenic landscapes).

### **Forest resource impacts not discussed.**

I23-49

Without explanation, the County has elected not to discuss potential impacts to existing forestry resources. This void occurs despite the County's aggressive development plans for the foothills and mountains.

# Tulare County Citizens For Responsible Growth

## ♦ Loss of Open Space

The TCCRG April, 2008 comment letter (attached) described a number of ways to increase protection of open space (pages 16-17, 21, 28-29), including use of a Transfer of Development Rights system. Since impacts to loss of open space were concluded to be unavoidable in the RDEIR, all available and feasible mitigation to reduce the impacts identified must be evaluated.

I23-50

## ♦ Biological Resource Impacts

The TCCRG April, 2008, comment letter noted numerous impacts which were not fully evaluated in the 2008 DEIR (letter attached). The additional analysis recommended was not included in the RDEIR presumably because, with a broad brush, impacts were concluded to be significant and unavoidable in most cases. However, our 2008 comment letter recommended a number of additional mitigation measures which must be evaluated in order to explore all available mitigation as required by CEQA.

I23-51

As an example, one particularly effective mitigation measure's revision was recommended which would serve to mitigate impacts to biological resources much more effectively than would have been accomplished in the RDEIR:

I23-52

*Revised ERM-1.2: Development in Environmentally Sensitive Areas: The County shall prohibit, restrict, or modify proposed development in areas that contain essential habitat for special status species, sensitive natural communities, and wetlands and riparian habitats as necessary to ensure the continued health and survival of these species and sensitive areas. Approved development projects shall be modified to avoid impacts to these resources to the maximum extent feasible. If habitat cannot be preserved, the County shall require developers of these resources to preserve at least one acre of land with comparable or greater resource value for every acre developed. The preservation of resource land shall be accomplished by purchasing the land in fee and dedicating a permanent conservation easement to a local non-profit land conservation organization; by dedicating a permanent easement over a portion of the property to be developed (generally on the edges of natural communities); or by paying a fee that will allow land with comparable resource values to be purchased and maintained by a local land conservation organization.*

This TCCRG recommended revision does not appear in ERM 1.2 (GPR p.8-9)

In other cases, biological resource mitigation measures were noted by TCCRG in our 2008 letter to be ineffective due to weak wording. One example is Policy ERM 1.14, which calls for mitigation banking; yet no implementation measure is created to ensure that this policy will be carried out.

I23-53

Each of the measures or revisions to measures related to biological resources which we recommended in 2008 must be evaluated in the GPU/RDEIR as to their effectiveness and an explanation given if they are not utilized, again, in an attempt to explore and adopt all available feasible mitigation.

I23-54

# Tulare County Citizens For Responsible Growth

## ♦ Air Quality and Global Climate Change

The TCCRG 2008 comment letter (attached) includes extensive comments on the Air Quality and Global Climate Change sections of the previous DEIR which still apply. We request that these comments be responded to in detail. | 123-55

The RDEIR does conclude that buildout of the General Plan will result in significant, unavoidable air quality impacts and contributions to global climate change. However, the RDEIR concludes that the proposed project addresses the issue of climate change, in part, by adopting a land use plan and policies that purportedly focus on compact growth (Table 3.4-5). Yet, examination of the GPU policies and implementation measures listed in response to the State Attorney General's recommended measures will show immediately that they will not serve to carry out the AG's recommendations. | 123-56

Throughout this comment letter, we have refuted the claim that the General Plan Update adequately promotes a compact urban form. In fact, the RDEIR does note that **at least two alternatives** could result in a more compact urban form. We have also recommended in this letter a third alternative that would more assuredly result in a more compact urban form. Yet, the RDEIR does not state any reasons why one of these more compact alternatives is not feasible and should not be adopted as a way to at least substantially reduce air quality impacts and greenhouse gas emissions. These reasons must be stated to ensure a legally adequate Alternatives discussion in the RDEIR. The greatest attempt possible must be made to find a feasible alternative which will address these (and other) significant, unavoidable impacts as required by CEQA. | 123-57

## ♦ Wildland Fire Hazard

The revised RDEIR should compare the relative fire risks and financial burden to the county of General Plan Alternatives that allow sprawling rural development versus development within existing boundaries served by existing fire-fighting districts. The RDEIR should analyze the following approaches to lowering risk and costs of wildfire in the General Plan Update: | 123-58

- Mandatory impact fees on new development near or within areas at risk of wildfire that reflect the true cost of providing fire protection and fuel reduction over the long-term,
- Greater focus on infill development within existing development boundaries as recommended in our Healthy Growth Alternative which keeps fire emergency response time short and makes fire fuel-reduction programs more efficient,
- Restriction of new parcels in areas rated "High" or higher, for fire hazard outside of existing fire district boundaries.

## ♦ Water Supply

The TCCRG April, 2008, comment letter (attached) includes extensive comments on the Water Supply section of the DEIR which apply to the RDEIR as well. We request that these previous comments be responded to in detail. | 123-59

# Tulare County Citizens For Responsible Growth

The RDEIR has been revised to make it clear that water supply impacts to individual water districts and the ability to serve growth provided in the General Plan Update are significant and unavoidable (RDEIR Impact 3.9-1). It concludes that groundwater drawdown will be significant and unavoidable (RDEIR 3.6-2). As a result, all available feasible mitigation must be explored. This conclusion gives greater importance to the need to adopt a land use alternative or set of mitigation measures, such as TCCRG's Healthy Growth Alternative, which will cluster development to a greater degree, thus assisting in water conservation and efficiency of serving new growth. The Healthy Growth Alternative (which could be created by a significantly revised Alternative 5) must be discussed in the Alternatives section of the RDEIR.

I23-60

## ♦ Water Quality

**Analysis of water quality impacts and available mitigation measures related to County buildout not adequate.** The General Plan Update RDEIR concludes that water quality will not be degraded as a result of buildout of the county (Impact 3.6-1). However, no adequate analysis of baseline conditions is provided, and no analysis is performed of water quality impacts that will occur as a result of intensive new development allowed by the General Plan Update. The policies cited to address mitigation do not add anything to the practices currently in place in the county. There is no specific evaluation of how these measures will actually be effective in avoiding water quality impacts even if implementation becomes more vigorous than is the current practice. As such, the water quality assessment fails basic requirements to provide a baseline assessment of conditions, to analyze significant effects that will be caused by the project, and to identify all available mitigation measures.

I23-61

The revised RDEIR must provide a more substantial analysis of the impact that the General Plan Update would have on the health of Tulare County watersheds and water quality. This analysis must include impacts associated with the grading of natural topography, loss of natural vegetation, filling of streams and wetlands, compaction of soils, and removal of trees and other natural vegetation. The RDEIR should describe the extent of such watershed disturbances projected to occur at full build-out at maximum allowable densities, and related effects such as alteration of local drainage patterns, increased impervious cover, loss of topsoil, increased erosion, and increased runoff.

In particular, numerous studies indicate that when as little as 10% of a watershed is covered in impervious surfaces, it becomes impaired. Greater amounts of impervious cover result in water quality impairments from increased pollution and runoff, as well as water supply impacts due to loss of groundwater recharge and contamination of local supplies. Increased runoff results in erosion and instability of stream banks, changes to channel structure, loss of natural vegetation and increased sedimentation. The revised RDEIR should analyze the expected increase in impervious coverage that would result from the GPU at full build-out, assuming maximum allowable development intensity/density, and describe related storm water, runoff pollution, flooding, erosion, loss of groundwater recharge and all other related impacts that would occur.

### **Water quality impacts of animal confinement facilities are not discussed in the RDEIR.**

I23-62

It has been almost nine years since the County entered into the settlement agreement requiring the County to prepare, circulate for public review, and certify the completion of an SPEIR to the PEIR for the Animal Confinement Plan-Phase I. The County agreed to carry out these actions within nine months (or sooner) from the effective date of the agreement, which was executed in June, 2001 (with the proviso that the time

# Tulare County Citizens For Responsible Growth

limit could be extended “as is reasonably necessary”). Clearly, impacts are not being mitigated; the Animal Confinement Facilities Plan (ACFP), which the General Plan Update incorporates by reference and which the RDEIR assumes will provide mitigation, is not being implemented. Yet the RDEIR does not address this issue. The General Plan Update must include specific policies and concrete, measurable implementation measures to address these substantial impacts since the ACFP cannot assure mitigation.

I23-62  
cont'd

## ♦ Traffic

The RDEIR Traffic and Circulation Impact section is inadequate in that it appears to use a population growth based impact analysis rather than a land use plan based analysis. It is unlikely that a land use plan based analysis could have been used since the County has not prepared a full land use plan with proposed land use designations over the entire county. To fully analyze traffic impacts, the RDEIR must be able to demonstrate what the full buildout of the General Plan might add up to by multiplying maximum density permitted by acreage in each land use designation and by subareas of the county. This is not possible with the information available, rendering the traffic impact discussion inadequate.

I23-63

However, since impacts to the County’s roadway levels-of-service are expected to be significant and unavoidable, the biggest drawback in the RDEIR automobile traffic analysis is the fact that not all available feasible mitigation measures were explored. In the case of traffic, the most obvious way to reduce impacts is to substantially reduce potential vehicle miles traveled by a greater assurance of establishing a compact urban form. The measures and alternative that we have described to this end throughout this letter must be analyzed relative to the ability to reduce traffic impacts.

I23-64

## ♦ Public Facilities and Services

The RDEIR concludes that the County may not be able to provide adequate water supply and wastewater treatment to serve the population provided for in the GPU, determining that impacts will be significant and unavoidable. (Impacts 3.9-1 and 3.9-2) As discussed throughout our comments, a legally adequate EIR must explore all available and feasible mitigation. However, the RDEIR does not identify the most obvious method to at least reduce the impacts identified – prohibition of New Towns (PCAs) and Regional Growth Corridors. These new growth areas have the potential to attract the portion of the market for housing and commercial that could have gone to infill existing unincorporated communities or to the cities or their annexations. A second effective measure would be to ensure that large scale development does not go forward in the unincorporated communities and hamlets without adopted plans and development concurrent with provision of adequate public sewer, water, and other services. Again, all available feasible mitigation such as these measures must be explored.

I23-65

Other services are determined to be mitigatable through adoption of a new fee structure (for parks, libraries, police, and fire protection) However, we were not able to find a target date for adoption of these fees or an assurance that the fee would be required at the full amount needed to provide adequate service. Until this is remedied, impacts must be considered unavoidable.

I23-66

Finally, the three to four sentences given to the evaluation of the City Centered and Confined Growth Alternatives in the RDEIR which conclude that public facility impacts and services would be similar to the proposed Plan is completely inappropriate given the importance of this issue to the choice of a general plan

I23-67

# Tulare County Citizens For Responsible Growth

strategy. Both of these alternatives and our Healthy Growth Alternative would direct enough growth to the cities compared to the other alternatives that the efficiency of providing sewer as well other public services would be substantially greater than in the proposed Plan. A fiscal impact report or draft fee study should be prepared to analyze this issue; an adequate analysis has not yet been provided.

I23-67  
cont'd

In general, planning for governmental services and public facilities including roads, sewage treatment, and water is one of the most basic jobs of a General Plan. Yet, the General Plan Update and the RDEIR have not taken the important first step toward solving those problems. Indeed, if these are truly unsolvable problems, adopting a land use alternative which clusters development more efficiently is an obvious solution.

I23-68

## ♦ Alternatives

The RDEIR states (page 7-1): “The purpose of this section of the EIR is to describe a reasonable range of alternatives to the project...that could feasibly attain most of the objectives of the project, but would avoid or substantially lessen any of the significant effects of the project, and to evaluate the comparative merits of the alternatives.” Unfortunately, the RDEIR fails all aspects of this CEQA requirement. As an initial matter, the RDEIR can't reasonably evaluate **any** alternatives, including the General Plan Update alternative until baseline buildout calculations based on actual spatial arrangement of proposed and existing land use designations have been established. The total lack of such calculations makes both the General Plan and the RDEIR merely speculative, and as such, not in compliance with the core CEQA requirements.

I23-69

The RDEIR also fails to provide a “*reasonable range of alternatives*” for consideration by Tulare County citizens and decision-makers. As described in the RDEIR, each proposed Alternative “assumes that all of the proposed policies and implementation measures contained in the Goals and Policies Report (GPR) for the GPU would be included as part of (this) alternative.” In other words, the four GPU Alternatives proposed in the RDEIR (in addition to the “no-project alternative”), while offering minor differences on the surface, have all been framed to implement the same non-specific and loophole-ridden GPU policies and implementation measures set forth in the General Plan Update/RDEIR. Although the proposed Alternatives have different titles and different stated priorities, they are as vague and general in nature as the underlying General Plan Update that they would implement. Because all the Alternatives incorporate the policies and implementation measures of the GPU/RDEIR, they lack specific growth-directing measures that would in fact produce different General Plan Update outcomes. As a result, each Alternative would allow, and even encourage, costly, inefficient sprawl development that would challenge our existing communities economically and politically while also jeopardizing Tulare County’s farmlands, natural resources, public health, and quality of life.

I23-70

This critique applies equally to Alternative 5 (Confined Growth Alternative), which was purportedly developed (per the 2008 DEIR) based upon “comments from Tulare County Citizens for Responsible Growth and American Farmland Trust.” While we appreciate the attempt to include a General Plan Alternative that addresses the goals we share with the overwhelming majority of Tulare County citizens who participated in the GPU “visioning” process, the proposed Alternative 5 is not reflective of our core concerns or the extensive and detailed input we previously provided. Given its exceptions, omissions and vagueness, Alternative 5 offers little essential or practical difference from the other development

I23-71

# Tulare County Citizens For Responsible Growth

alternatives presented, and cannot therefore be objectively considered a true, much less an environmentally-superior, development alternative.

I23-71  
cont'd

The RDEIR projects that, whichever Alternative is selected, 26-32% of the total population in the County will reside in the unincorporated area in 2030 (RDEIR Table 4-1) Again, the nearly identical outcomes in terms of future population distribution are predetermined by the incorporation of the GPU's flawed policies and implementation measures into each "alternative."

I23-72

The RDEIR is also inherently inadequate because it includes only a superficial assessment of the degree to which each proposed Alternative would meet the stated objectives of the General Plan Update, without detailed justification for its conclusions. Conclusions about the failure of the City-Centered Alternative to meet various project objectives are not well explained, and are simply not supportable given the absence of details provided about the specifics of each Alternative's proposal. The RDEIR concludes that the Confined Growth Alternative will not meet one project objective: increased development in unincorporated communities. This is certainly not the case, since under the basic concept of this Alternative it would be possible to allow infill growth in these areas and modest growth within appropriate confined boundaries.

I23-73

Finally, the RDEIR does not adequately describe why any of the project alternatives are not feasible, as required by CEQA (Public Resources Code Section 21001). It is not adequate simply to conclude that the project sponsor's objectives are not met. And, in the case of Alternative 5, again only one objective is said to not be met – allowing unincorporated communities to grow. This is an artificially narrow objective; it could be met readily by this Alternative or a slight revision to it.

I23-74

Similarly, the RDEIR fails to provide a quantified, objective comparison of the significant impacts that would result from the adoption of each Alternative. Instead, unsupported general assessments are proffered about the impact each Alternative would have compared with the General Plan Update (i.e., a more or less Significant Impact than the General Plan Update), with no basis provided for these assessments. What criteria were used to categorize the relative impacts generated by each proposed Alternative to the General Plan Update? What data, benchmarks, thresholds or other forms of analysis were used to conclude that an impact created by one Alternative would be lesser or greater than the General Plan's impact? A fiscal impact analysis would offer clear quantified analysis of the feasibility of providing appropriate traffic improvements and public facilities and services under each Alternative. Certainly impacts such as traffic and air quality lend themselves to a quantified analysis. Indeed, how can any assessment be made at all, without baseline spatial buildout calculations against which the results can be compared? Detailed, quantified analysis of each Alternative is needed in each impact issue area to understand the relative impacts.

I23-75

The root of the RDEIR's problem is that non-specific Alternatives are proposed to implement a vague and loophole-ridden General Plan Update, making it virtually impossible to "evaluate the comparative merits of the alternatives," as required by CEQA. As a result, the relative comparisons of the Alternatives are meaningless and of little or no value in helping Tulare County decision-makers select an Alternative that could "feasibly attain most of the objectives of the project, but would avoid or substantially lessen any of the significant effects of the project." To fulfill the most basic of CEQA requirements, the RDEIR must be meaningfully revised to present a reasonable range of General Plan Alternatives that includes at least one alternative that clearly and firmly directs growth into those urbanized areas that have the desire and capacity to accommodate that growth.

I23-76

# Tulare County Citizens For Responsible Growth

## **TCCRG Recommendation: the Healthy Growth Alternative.**

I23-77

RDEIR Alternative 5, the Confined Growth Alternative, is similar in some respects to the Healthy Growth Alternative TCCRG proposed in our Notice of Preparation comments and our comments on the previous, 2008 draft General Plan Update. However, loopholes and provisions inherently inconsistent with smart growth -- such as regional Growth Corridors, floating Planned Community Areas, large and unrealistic Hamlet boundaries, and a weak policy structure relative to mandating compact, contiguous, resource-efficient growth and protection of farmland and open space – coupled with unreliable assurances that development will be directed to the cities, make the RDEIR's proposed Alternative 5 unacceptable. We again urge the County to extensively revise Alternative 5 to provide for a true alternative in the RDEIR that will meet all project objectives while significantly reducing the environmental impact of the project. This loophole-free "Healthy Growth Alternative" should include clear, firm policies that specifically support the following:

### **Revised Alternative 5:**

#### **The Healthy Growth Alternative**

1. **Base the location, density, and amount of growth within urbanized areas on their desire and capacity to accommodate growth.**
2. **Locate development (except that which is directly related to agriculture) within existing Development Boundaries, without loopholes or exceptions that allow for leapfrog new town or growth corridor development. This can be accomplished by:**
  - a. **eliminating the CACUABs and replacing them with firm agricultural designations; and**
  - b. **Ensuring that the Land Use Diagram locates all specific land use designations in the unincorporated area**
3. **Require (or incentivize) efficient development within or contiguous to existing urban areas:**
  - a. **Ensure that urban development takes place only:**
    - i. **Within incorporated cities;**
    - ii. **within the UDBs of adjacent cities in other counties;**
    - iii. **within UDBs of unincorporated communities and HDBs of Hamlets.**
      1. **these UDBs and HDBs must be designated only after specific plans have been adopted for each of them which include boundaries**

# Tulare County Citizens For Responsible Growth

revised to focus on infill development and well-timed, healthy, resource-efficient growth appropriate to each of these communities and hamlets.

I23-77  
cont'd

2. Community and Hamlet plans must clearly locate specific land uses of an appropriate scale of neighborhood commercial and non-residential uses, to be developed only if concurrent with the provision of needed infrastructure and developer mitigation fees, and to be reviewed for consistency with Development Efficiency Targets. (Blanket interim Mixed Use designations over entire UDB or HDB not permitted.)

The intent of this provision is to eliminate County approved urban development in the City UDBs (other than under existing zoning requiring no new parcelization or use permits). City land use designations and pre-zoning for urban land uses would be allowed in the UDBs for use only by the cities when they annex these lands.

b. To accomplish this, the County must:

- i. revise existing (or proposed in this Draft General Plan Update) policies such that the County land use designations and zoning in what is now referred to as the CACUDBs will be agricultural zoning only;
- ii. Implement equitable revenue sharing arrangements with the incorporated cities.
- iii. Revise the Land Use Diagram to require at least an 80% (or greater)/20% city/unincorporated population at buildout of the GPU.

4. Make community and hamlet development boundaries meaningful, long-term planning boundaries by firmly limiting the circumstances under which they can be expanded.
5. Prohibit Growth Corridors and Planned Communities (New Towns) in the unincorporated area.
6. Discourage the premature conversion of agricultural lands to urban uses, and offset unavoidable impacts to agricultural lands and natural resource areas with mandatory mitigation measures such as conservation and agricultural easements:
  - a. Include the system of Development Efficiency Targets proposed by the American Farmland Trust before any community UDB or HDB is revised and before any individual discretionary land use development project, policy, or program is approved
  - b. Revise the agricultural conservation easement policies to require that when developments are approved that will result in the loss of agricultural land, a fee

# Tulare County Citizens For Responsible Growth

will be assessed to purchase, at a minimum ratio of 1:1, agricultural land protection easements of equal value elsewhere in the county.

I23-77  
cont'd

7. Provide strong, clear policies with concrete, enforceable implementation measures that include definite timeframes, funding sources, and departments in charge of monitoring and enforcement.

## ♦ Growth Inducing Effects

**Population Growth: Induced or Absorbed?** The General Plan Update is predicated upon a substantial increase in population in Tulare County by 2030. The revised RDEIR must fully disclose and explain the data, models and assumptions used by the California Department of Finance and the Tulare County Association of Governments to project growth in Tulare County over the life of the General Plan Update. Why is the rate of growth projected during the term of the GPU projected at nearly double the rate of growth that has occurred in recent decades? Given the recent economic downturn, are the 2030 growth projections used still valid?

I23-78

The revised RDEIR must disclose what portion of the population growth projected in the RDEIR would be directly induced by the increased uses and densities proposed in the General Plan Update. A revised RDEIR must specifically analyze the extent to which the proposed GPU would allow and even encourage sprawl, and therefore induce population growth in areas where growth is currently constrained (such as in Planned Community Areas/New Towns, Growth Corridors, resulting from changes to the FGMP, and the Mixed Uses (and exemptions from the RVLP and FGMP) proposed to be permitted in HDBs and unincorporated UDBs. Why would the inclusion of a New Town or New Towns not induce growth beyond the background growth rate expected, given that this is an entirely new land use form for the county?

I23-79

Without these analyses, the RDEIR inadequately informs the reader how much the Plan would “*foster economic or population growth... either directly or indirectly...*” (CEQA Guidelines Section 15126.2(d)) and where this growth would be fostered.

# Tulare County Citizens For Responsible Growth

## III. Conclusion

In conclusion, we recommend that the General Plan Update Land Use Diagram be completely revised following the template of our proposed Healthy Growth Alternative to better ensure a compact urban form in Tulare County that will not only protect agricultural and open space lands to a much greater extent than proposed in the current draft, but also foster an improved quality of life for all Tulare County residents. We also recommend that the GPU/RDEIR policies and mitigation measures be revised to more effectively reduce the numerous impacts we have addressed in this letter. At that time, the RDEIR can be recirculated for further public review.

I23-80

Sincerely,

Tulare County Citizens for Responsible Growth

Kelly R. Mitchell  
Executive Director

Laurie Oberholtzer  
Urban and Environmental Planner

RE: General Plan U2030 Update and Draft Environmental Impact Report (SCH No.2006041162)

Dear Mr. Bryant,

The Wuksachi Indian Tribe of Tulare County would like to acknowledge our support for the Southern Sierra Archaeological Society (SSAS).

Comments on the recirculated Draft Environmental Impact Report (DEIR) and the revised Tulare County General Plan Update 2030 (GP).

We feel it is very important to our cultural identity that the mentioned concerns be implemented into the GP and DEIR for future protection of the culturally sensitive areas all around the County of Tulare.

Re: General Plan 2030 Update and Environmental Impact Report

Dear Mr. Bryant,

Enclosed please find my comments regarding the General Plan Update and Environmental Impact Report with respect to the Urban and Wildland Fire Hazards included in the Health and Safety Element.

I25-1

I appreciate that The Re-circulated EIR Draft addresses the significant threat of wildland fires in this county when it states, *"As future development occurs, wildland fires would continue to pose a significant threat to the people and structures of the County, in particular those residing in the Foothill Growth Management Plan and Mountain Framework Plan Areas, which are more susceptible to wildland fires due to potential fuel loads (grassland and other vegetation)."* Much thought and concern has been devoted to this pressing issue as it relates to fire season and climate changes as it goes on to say *"One of the primary factors contributing to the effective control of a vegetation fire is the rapid response by local fire units. This is especially true during fire season, when fire units may be committed to other fires and are unavailable to respond as quickly. Under future climate change conditions, more extreme weather conditions may occur that potentially results in greater fire fuel loads, a longer fire season, and/or a greater area containing vegetation susceptible to wildland fires. Climate change conditions could expose more people and structures to wildland fire potential"*

I25-2

Within this GPU there is a comprehensive and thorough list of policies and implementation measures regarding the threat of wildland fires to Tulare County. And while I could analyze these policies and implementation measures as to their lack of clarity or the need for stronger language or request that some implementation measures be strengthen, this has been thoroughly addressed previously by Laurie Schwaller in her comments regarding the GPU dated December, 2007. Those comments continue to be pertinent because the policies and implementation measures addressed in that document are the same as in this GPU.

I25-3

I find it more important to address an overall weakness is this document: The current DEIR fails to analyze how much new development would be allowed by the

I25-4

## Letter I25

GPU at build-out in areas assessed as high or extreme wildfire risk. This must be disclosed in the revised DEIR to allow a more comprehensive assessment of new fire risks posed by urban construction in fire-prone areas.

I25-4  
cont'd

The DEIR goes on to state that the county will implement a variety of these policies designed to address fire hazards and minimize exposure of people and structures to fire hazards and that CEQA documentation will be prepared for future individual projects as they occur. Based upon this it declares that that the impact of fire hazards to be less than significant.

I25-5

Please re-evaluate the fire risk that would be caused by the GPU by first analyzing how much new development would be allowed by the GPU at build-out in areas of high fire risk and then reanalyze the significance of this impact and whether mitigation is necessary.

The revised DEIR should compare the relative fire risks and financial burden to the county of the current, nearly identical alternatives in the DEIR, with the risks and costs of a healthy growth alternative that directs all future growth within existing boundaries served by existing fire-fighting districts. The revised DEIR or Final EIR should analyze the following approaches to lowering risk and costs of wildland fire in the General Plan Update:

I25-6

- Mandatory impact fees on new development that reflect the true cost of providing fire protection and fuel reduction over the long-term
- Infill development within existing development boundaries which keeps fire emergency response time short and makes fire fuel-reduction programs more efficient.
- Restriction of new parcels in high hazard fire areas outside of fire district boundaries.

I thank you for considering these comments.

Most sincerely,

Kathleen Seligman

**Re: Tulare County General Plan 2030 Update - February 2010  
Comments on Recirculated Draft Environment Impact Report**

Dear Mr. Brusuelas:

I submit these comments on behalf of the Kern-Kaweah Chapter of the Sierra Club. The Sierra Club has already submitted extensive comments under separate cover. My comments supplement and incorporate by reference those separate comments.

Based on the legal inadequacies that are identified here and in Sierra Club's separate comments, I urge you to re-circulate the EIR before considering final approval of the GPU.

I26-1

**PROJECT DESCRIPTION IS FLAWED**

Although the 2030 General Plan Update (GPU) will aggressively promote residential and commercial growth within and adjacent to the urban boundaries of existing communities such as hamlets and cities, in addition to the mountain and foothill regions and Rural Land Use Plan and Corridors Framework Plan, the EIR fails to consistently and accurately identify the location of this growth or to explain the population increase that it will foster. These aggressive plans for fostering what essentially amounts to new communities are poorly explained in the Recirculated Draft EIR.

Figures 2-2 and 2-3, for example, purportedly depict areas slated for future development. Yet, these figures do not provide sufficient detail to aid in assessing the associated proposed project impacts. Moreover, the RDEIR itself does not include any meaningful analysis of the expected development potential, including the expected

I26-2

Fred Brusuelas, Chief Planner  
Tulare County Resource Management Agency  
May 27, 2010  
Page 2 of 23

population and commercial growth in the various areas slated for development. Likewise, the GPU does not include a meaningful projection of the increase in population and commercial/industrial development that would be expected in each of these areas. This information is vitally needed to permit a comprehensive environmental analysis of the GPU.

I26-2  
cont'd

Although the GPU anticipates much urban growth within the so-called regional growth corridors, the locations of these corridors have not been established. The GPU defers the formulation of the location and the description of the corridors to "future amendments to the General Plan Land Use Designation Map." RDEIR at 2-13. Without knowing the location or size of the growth corridors, it would be impossible to analyze the potential environmental impacts of establishing such growth corridors. The Project's description, therefore, is flawed because it fails to describe the growth corridors.

I26-3

Moreover, the policy of locating development along regional transportation corridors, or in other planned communities/new towns, appears to directly conflict with the GPU's stated goal of allowing development only adjacent to existing population centers. This goal is designed to promote smart growth, to reduce the overall number of vehicle miles travelled and to promote a strong and viable public transportation system. RDEIR 3.4-27. The only point of having a separate development district entitled "regional growth corridor," that is distinct from the urban growth boundaries of existing communities and population centers, would be to locate new and isolated development along the "growth corridor." Otherwise, there would be no need for this special and distinct designation. But if the goal of creating this new land use designation is to promote isolated growth, how can this objective be reconciled with the GPU's stated objective of permitting growth only in the vicinity of existing communities?

I26-4

The GPU further calls for the future adoption of uniform community plans (PF-2.6) but, until such time, the GPU designates all the land within communities without a plan as "mixed use." This designation would essentially permit the construction of any type of development, be it residential, commercial, or "service and employment"

I26-5

Fred Brusuelas, Chief Planner  
Tulare County Resource Management Agency  
May 27, 2010  
Page 3 of 23

opportunities without regard to the character of the neighborhood or the adjacent land uses. It is not clear how many communities will be affected by this policy, or how much or what type of development will be fostered by this designation. The RDEIR fails as an informational document to the extent that it fails to describe the potential impacts of this designation.

I26-5  
cont'd

Finally, the RDEIR explains that the County has already revised the Housing Element. It is not clear how the RDEIR relates to the already approved Housing Element, or the extent to which the impacts from the Housing Element were considered prior to approval.

I26-6

**A. The GPU must be revised to include enforceable policies and implementation measures to direct and manage urban development and growth.**

I26-7

Despite the EIR's claim to the contrary, the GPU does not include adequate tools or policies to meaningfully manage and direct uncontrolled growth to existing communities and hamlets. While the GPU and the RDEIR pay lip service to the idea of promoting orderly growth and protecting agriculture and open space, the County actually proposes policies that merely "encourage" urban development to be located within existing UDBs and HDBs (PF-1.3, 104). It is not clear how the County would encourage such policies, but what is clear is, that without mandatory language, the policy is destined to fail.

Moreover, the UDBs themselves are readily subject to modification and expansion provided only that sufficient infrastructure and water supplies are available. See, PF-2.2 (2). As we will explain below, it is clear that the County does not believe availability of water supplies is an environmental constraint that could slow down the rate of development. The County apparently believes that groundwater supplies are available for the taking, despite the declining groundwater levels and the increasing severity of the overdraft, not to mention the increasingly scarcity of imported surface water supplies. (Un)Availability of water supply, therefore, will not meaningfully limit expansion of UDBs.

I26-8

Fred Brusuelas, Chief Planner  
Tulare County Resource Management Agency  
May 27, 2010  
Page 4 of 23

For any developer prepared to pay for the cost of expansion of infrastructure, availability of infrastructure would likewise not be a realistic problem. Even if the developer is unable or unwilling to pay the full cost of the infrastructure, other mechanisms exist to finance such development. These mechanisms include the availability of Mello-Roose districts (approved by the City of Tulare in connection with the Tulare Motor Sports Complex), providing tax incentives or density bonuses, and joint public/private funding ventures, which would defray the cost of construction by imposing fees on future developments that would benefit from the availability of infrastructure. Therefore, by conditioning the expansion of UDB's on provision of infrastructure by developers, the County is in effect promoting regional growth outside urban boundaries and effectively discouraging infill development.

I26-9

**B. The RDEIR/GPU does not include legally sufficient mitigation measures to address the GPU's adverse impact on farmlands.**

I26-10

The RDEIR readily admits that the GPU will result in significant impacts on agricultural resources. These comments will focus on conversion of agricultural lands, which the RDEIR concludes will inevitably result from the implementation of the GPU. The RDEIR recognizes this to be a significant impact, but fails to include meaningful and enforceable mitigation measures.

The RDEIR concludes that the GPU will result in "substantial conversion of important farmlands to non-agricultural uses." Impact 3.10-1, RDEIR 3.10-11. To mitigate this loss, the RDEIR cites Policies AG-1.6 & 1.8 and Agricultural Implementation Measure #15. These measures, individually or collectively, do not constitute adequate or legally sufficient mitigation because they are unenforceable, lack an implementation time-line, and do not include measurable performance criteria.

A fundamental purpose of the EIR is to identify appropriate mitigation measures. Public Resource Code §210021.1(a). Mitigation measures must not be remote or speculative. *Federation of Hillside & Canyon Ass'n v. City of Los Angeles* (2000) 83 cal.App.4<sup>th</sup> 1252, 1260. Mitigation measures must be legally binding to ensure that they will actually be implemented. *Id.* at 1261. A mitigation measure is legally inadequate if it is so undefined that is impossible to gauge its effectiveness. *San Franciscans for*

I26-11

Fred Brusuelas, Chief Planner  
Tulare County Resource Management Agency  
May 27, 2010  
Page 5 of 23

Reasonable Growth v. City and County of San Francisco (1984) 151 Cal Ca.App.3d 61, 79.

I26-11  
cont'd

Deferral of the formulation of mitigation measures is generally forbidden unless the agency finds that, for specific reasons, formulation of mitigation measures before project approval is infeasible. Even then, the agency must adopt concrete performance criteria and explain how the mitigation measures can be feasibly implemented. San Joaquin Raptor Rescue Center v. County of Merced (2007) 149 Cal.App.4th 645, 670; CEQA Guidelines 15126.4(a).

The RDEIR's proposed mitigation measures do not pass legal muster for a host of reasons. To begin with, these measures are not legally binding on the County: AG-1.6 provides that the County "may" develop an Agricultural Conservation Easement Plan, which "may" require in-lieu fees. AG Element Implementation Measure 15 requires the County to "consider" the implementation of an Agricultural Conservation Easement Plan. None of these provisions are mandatory, meaning the County may decide never to implement a plan to mitigate the loss of farmlands or to impose fees for the same purpose.

I26-12

The proposed mitigation is inadequate also because it is remote and lacks any implementation timeline. So, for example, the County may decide not to implement an Agricultural Conservation Easement Plan for decades. Without a timeline for implementation, the mitigation measures are illusory.

I26-13

The proposed mitigation measures are illegal also because they are vague and lack any specificity. Even if the County were to adopt and implement an Agricultural Conservation Easement Plan, it is not at all clear that such a program would adequately mitigate the impact on agricultural resources because it is not clear how the program would promote the conservation of farmlands. The policy does not include any ratios for exacting an in-lieu fee or a formula for the number of acres of farmland that must be set aside to offset the loss of farmlands. Without any specificity or performance standards, this measure fails as a mitigation measures.

I26-14

Fred Brusuelas, Chief Planner  
Tulare County Resource Management Agency  
May 27, 2010  
Page 6 of 23

Finally, Policy PF-2.2(1) --which prohibits conversion of Prime Farmlands unless Farmland of Statewide or lesser quality is available -- does not appear to provide any meaningful protection against conversion of farmlands because the PF-2.2(1) uses the permissive "should" and not the restrictive "shall". Moreover, in some if not most areas, farmlands of lesser value may not be readily available.

I26-15

## CIRCULATION AND TRAFFIC

Owing to the deteriorating state of the county rural roads, the County will be required to expend significant resources (\$250 million) to make the necessary repairs. Moreover, the background report admits that due to the significant increase in the number of dairies and CAFO's in the County, the volume of truck traffic has also substantially increased, further accelerating the rate of deterioration. Background Report at 5-39 to 5-43.

I26-16

The EIR's prediction, therefore, that sufficient funding exists to mitigate the impact of additional traffic and growth does not appear to be tenable. The County must make a realistic assessment of the future availability of funds to support transportation improvements before assuming that proposed or identified traffic mitigation projects are feasible.

The EIR (at 3.2-26) states that some roadway facilities that currently operate at a level of service D or worse are not capable of improvement because of "local physical and environmental constraints." The EIR does not explain in any detail what the alleged physical or environmental constraints may be. Contrary to the assertion made in the EIR, these alleged constraints are not more fully explained in the Methodology section of the EIR. The EIR's conclusory claim that achieving a better level of service is impossible given the current circumstances must be better explained and supported by reference to evidence in the record. It should also be noted that the EIR's reference to "Policy TC-1.6" as the source of the County's Level of Service policy is incorrect. The correct reference is Policy TC-1.16.

I26-17

Fred Brusuelas, Chief Planner  
Tulare County Resource Management Agency  
May 27, 2010  
Page 7 of 23

After a discussion of the County's LOS objectives in the Analysis Section, the EIR purports to discuss the Project's potential impact on roadways and levels of service. The EIR claims that a "series of models runs were conducted to evaluate the effectiveness of the circulation plan." (EIR 3.2-24). The EIR goes on to claim that as a result of these "model runs" it was determined that several roadways will require future improvements. Besides identifying those intersections, however, the EIR fails to discuss the results of the model runs, or provide any reference to the data in the appendixes. The EIR also explains that interchanges were not analyzed quantitatively, but it would be important for the EIR to "address interchanges in Tulare County that should be considered for improvements within the life of the proposed project." (EIR-3.2-25). Without any quantitative analysis, the EIR concludes that a number of intersections will require Measure R moneys for improvement, and that the impacts from the proposed General Plan Revisions will be significant and unavoidable.

I26-18

The trouble with the County's failure to provide any quantitative data or analysis is that it leaves the reader in the dark as to the GP Updates' impact on roadways. While identification of impacted roadway segments or interchanges may be "important" or useful, it is not a substitute for quantitative data. Without knowing the severity of the potential impact on roadways, the public and the County decision-makers are not in position to intelligently debate the merits of different growth patterns and strategies or have a real sense of the extent of the impact of the proposed project. Mere acknowledgment that the impact is significant is not sufficient.

I26-19

### **AIR QUALITY**

The Air Quality section of the EIR begins with a discussion of the current state of the air quality in San Joaquin Valley. This discussion tends to understate the current woeful state of the Valley's air quality by emphasizing some of the improvements that have been accomplished in recent years. For example, with regards to PM<sub>10</sub>, the EIR explains only that in 2008, the EPA re-designated the San Joaquin Valley to "attainment" for PM<sub>10</sub>. What the EIR does not admit, however, is that the Valley is still

I26-20

Fred Brusuelas, Chief Planner  
Tulare County Resource Management Agency  
May 27, 2010  
Page 8 of 23

in nonattainment for PM10 and PM2.5 for State Standards. Moreover, the EIR fails to note that the Valley remains in “nonattainment” for PM2.5 for Federal Standards. The EIR should be revised to honestly assess the area’s air quality and explain in narrative form the attainment status of the local air quality.

I26-20  
cont'd

The EIR admits that implementation of the Project will result in the worsening of the local air quality. The EIR concludes that the GPU will result in a net increase in criteria pollutants thereby resulting in violation of air quality standards (Impact 2.3-2), would conflict with or obstruct the implementation of applicable air quality plans (Impact 2.3-3), and would expose sensitive receptors to substantial pollutant concentrations, thereby affecting public health (Impact 2.3-4). Yet in each instance, after merely reciting a number of largely toothless policies as potential mitigation measures, the EIR concludes that no additional feasible mitigation measures exist to further reduce the significant impacts. In this regard, the EIR suffers from two principle legal deficiencies: (1) most of the proposed mitigation measures are too vague and unenforceable to pass muster under CEQA, and (2) the conclusion that no additional feasible mitigations exist to reduce the GPU’s impact on air quality is not supported by any adequate analysis or evidence in the EIR or the Record.

I26-21

**1. The proposed air quality mitigation measures are too vague and unenforceable to pass muster under CEQA.**

I26-22

Some of the proposed policies designed to improve air quality are too vague and unenforceable to pass legal muster. Participation in local and regional plans (AG-1.2) is one such measure. Participation could mean nothing more than sending a representative to meetings. Likewise, cooperation with other agencies is vague and meaningless.

The mitigation measures that require development projects to comply with existing law, such as SJVAPCD Rule 9510, is essentially meaningless as these development projects are already required by a different agency to comply with rules within that agency’s purview. So to pretend that the County’s Policy (eg. AQ 2.2) is a mitigation measure at all is intellectually indefensible.

Fred Brusuelas, Chief Planner  
Tulare County Resource Management Agency  
May 27, 2010  
Page 9 of 23

The County is not willing to adopt air quality policies that would bind its own actions to improve air quality. For example, AQ-1.6 requires the County merely to “encourage” County departments to replace existing vehicles with low emission/alternative fuel vehicles as appropriate. Other policies likewise merely require the County to encourage infill development (AQ 3.2) or locate employee services near employment centers (AQ 3.1), etc. These typed of toothless policies cannot be considered a mitigation measure under CEQA.

I26-22  
cont'd

**2. The conclusion that no additional feasible mitigation measures can be feasibly implemented is not supported by substantial evidence.**

I26-23

The GPU is chock-full of empty gestures and promises. Although many of the proposed goals and policies may seem to be designed to benefit the health and welfare of the people and to serve as mitigation for the adverse impacts of future growth, after careful consideration, it becomes readily apparent that these goals and policies are essentially toothless and are incapable of effectively addressing either existing environmental problems or those that may result from future growth.

For example, many policies and goals appear to be designed to ensure orderly development, protection of air quality and reduction of GHG emissions. Pursuant to AQ-1.3, for example, the County is directed to “require development to be located, designed, and constructed in a manner that would minimize cumulative air quality impacts.” AQ-1.3 goes on to explain that “applicants shall be required to propose alternatives as part of the State CEQA process that reduce air emissions” . . . Yet, proposing “alternatives” in and of itself does nothing to reduce air emissions, if the environmentally superior alternatives are not implemented by the County. In addition to identifying onsite energy-saving measures, minimizing the number of miles travelled and paying air impact mitigation fees to offset emissions are the most effective means of addressing a project’s air quality impacts. Yet, as we explained above, the GPU does not require payment of air impact fees as mitigation for air emissions and does not contain any concrete policies to require development to be centrally located in the vicinity of existing population centers.

Fred Brusuelas, Chief Planner  
Tulare County Resource Management Agency  
May 27, 2010  
Page 10 of 23

### WATER SUPPLIES

Adequacy of water supplies is a significant environmental issue and likely the most important limiting factor affecting the future growth of the County. Yet the EIR does not contain any sufficient analysis of adequacy of groundwater supplies to serve the future growth anticipated by the GPU. To the contrary, the EIR includes an extremely cursory “qualitative” analysis of existing conditions and future demands, without any community-by-community analysis of adequacy of groundwater supplies. We note the original draft EIR for the 2030 GPU did contain such a community-by-community analysis. The size and adequacy of water supplies and infrastructure, as well as expected future demand, varies tremendously across the County. To the extent that the GPU calls for and anticipates growth in each hamlet, community and in other urban areas, the RDEIR must be revised to include a thorough analysis of water supply availability for each affected community.

126-24

The EIR’s analysis of water supplies largely relies on the deficient June 2009 “Water Supply Evaluation” that appears in the EIR appendices. While it is infeasible to check every contention or claim in this document, the following is a list of the report’s inadequacies, false assumptions, and glaring omissions. Although the EIR does correctly conclude that the proposed GPU will adversely affect groundwater resources, the EIR’s methodology in assessing the impact is flawed and understates the impact. Moreover, we do not believe the County may legally approve the GPU and permit the substantial growth envisioned by the GPU without implementing adequate mitigation measures and, more significantly, without identifying reliable sources of water.

126-25

**A. The Report fails to explain the basis for its assumptions and calculations.**

126-26

The Report assumes that future conversion of agricultural lands to urban uses (largely residential) will result in a reduction in groundwater demand. To calculate the expected future water demand, the Report estimates the number of acres of farmland that will be converted from farmland to non-agricultural use to predict the County’s future water demand (with GPU). See Page 6. To conduct this analysis, the Report assumes that

Fred Brusuelas, Chief Planner  
Tulare County Resource Management Agency  
May 27, 2010  
Page 11 of 23

net water demand can be estimated by subtracting the total expected urban demand from the total quantity of water that will be saved by displacing farmlands with urban usage.

I26-26  
cont'd

This approach is deeply flawed for two principle reasons: (1) it fails to take into account the water demand by urban projects that will not be built on existing farmlands, i.e. infill development, and (2) the Report fails to provide any analysis or justification for the assumptions that underlie the future water demand analysis contained in Figure 2.2.

1. **The Report fails to consider the water demand associated with urban growth (residential, commercial, industrial) that will occur on non-agricultural land.**

I26-27

Without any discussion, the Report simply assumes that all future growth will occur by displacing existing agricultural operations. See Page 6. The Report never bothers to estimate the extent to which urban growth may occur on land that is either not in agriculture, such as land in existing hamlets or vicinity of towns and villages, or land that, although suitable for farming, is not or has not been in active cultivation. By assuming a 1:1 relationship between loss of farmland and future growth, the Report tends to underestimate the net future water demand generated by the adoption of the GPU.

Likewise, without any adequate explanation, the Report simply assumes that “all acres identified as farmland are assumed to have a water demand.” *Ibid.* But there is no evidence offered to suggest that some of the land that may be displaced by urban usage may not be on non-irrigated land such as orchard.

I26-28

To predict future urban water demand, the Report apparently relied on “City of Fresno’s Urban Water Management Plan (UWMP) and professional judgment from other studies.” Report at 9. It is wholly unclear water “other” studies were referenced or why Fresno’s UWMP was used as a source. The Report does not attempt to explain why it was appropriate to use a large City’s water use portfolio in Tulare County, when much of the development is expected to be in smaller hamlets or other more rural communities.

I26-29

Fred Brusuelas, Chief Planner  
Tulare County Resource Management Agency  
May 27, 2010  
Page 12 of 23

Accordingly, it appears that unless the County can justify these assumptions, the Report's estimate of future water demand may be understated.

I26-29  
cont'd

**2. The Report does not explain the basis for the assumptions regarding the amount of acreage it expects.**

I26-30

Again, without any explanation, Table 2.5 (p. 10) of the Report "explains" the County's expected change in water demand in each community, hamlet or City UDBs. These predictions appear to be nothing more than pure speculation or guess work, rather than the kind of forecasting that is required by CEQA. In fact, the EIR itself seems to disavow these assumptions by explaining that "the nature and extent of agricultural water conversion . . . is not known." RDEIR 3.6-24. The EIR's admission that the extent of the agricultural conversion is unknown cannot be reconciled with Table 2.5, which speculates about the extent of agricultural conversion.

The EIR must explain the basis for Table 2.5, or disavow the Report altogether. Because of the inconsistencies between the EIR and the Report, because of the speculative and unexplained nature of the assumptions that inform the Report's analysis, we do not believe the County can appropriately rely on the 2009 Water Report. *City of Redlands v. County of San Bernardino (2002) 96 Cal.App.4th 398, 410 (fns. omitted.)* ("The following does not qualify as substantial evidence under CEQA: 'argument, speculation, unsubstantiated opinion or narrative, . . . Substantial evidence, instead, consists of 'fact, a reasonable assumption predicated upon fact, or expert opinion supported by fact.' ") The EIR, therefore, must be revised to explain the basis for the assumptions that inform the County's calculation of future water demand. In particular, the County must explain the basis for predicting the number of acres of farmland it expects to be converted to urban use in each community.

I26-31

**B. The EIR and the Water Report's analysis of future water demand understates the impact on groundwater and is legally indefensible.**

I26-32

Although the EIR admits that the GPU will result in a significant impact on ground-water supplies, it tends to understate the impact. Despite admitting that the extent of agriculture to urban land use is not known, the EIR speculates that "increases in urban water demand resulting from population growth may be offset by decreases in

Fred Brusuelas, Chief Planner  
Tulare County Resource Management Agency  
May 27, 2010  
Page 13 of 23

other forms of water use (i.e. agricultural water conversion) or increases in water use efficiency.” RDEIR at 3.6-42. Moreover, the 2009 Water Supply Report (despite the flaws outlined above) concludes that “there will be a slight reduction in water demand” based on the anticipated conversion of cultivated acreage to urban usage. This conclusion, however, is the product of a flawed analysis that fails to take into account the substantial agricultural surface water supplies that provide much of the water needed for agriculture.

I26-32  
cont'd

As explained in the Water Report, water for urban use is provided by pumping groundwater, while agricultural water supplies include both groundwater and surface water flows. The surface water is supplied through various irrigation districts from two sources: local water sheds and imported water. The bulk of the imported water is delivered through the federally managed Central Valley Project (CVP) by way of the Friant-Kern Canal. Additional supplies are also delivered by the State Water Project (SWP) from the Sacramento Delta. See, Table 3.2 at p. 18.

The EIR’s suggestion that water demand from urban growth may be offset by decreases in agricultural water use is misleading and poorly explained. First, as hinted by the Water Report, “where cultivated] lands were previously served with surface water [there [would] be a likely increase in the total extraction of groundwater.” Report at 35. Because much of the water used for agriculture in Tulare County comes from surface water deliveries, it is unclear that groundwater extractions for urban use would be offset by conversion of farmlands.

Moreover, it is well known that using surface water deliveries (both imported and surface supplies) for cultivation for crops has the added benefit of recharging the groundwater basin. The Report does not include any analysis of the extent to which surface water deliveries beneficially affect the groundwater basin through seepage back down into the groundwater basin. The RDEIR must be revised to accurately predict the impact on groundwater supplies that may result from conversion of farmlands to urban use.

Fred Brusuelas, Chief Planner  
Tulare County Resource Management Agency  
May 27, 2010  
Page 14 of 23

**C. The RFEIR must identify and analyze alternative water supplies.**

126-33

“[W]here, despite a full discussion, it is impossible to confidently determine that anticipated future water sources will be available, CEQA requires some discussion of possible replacement sources or alternatives to use of the anticipated water, and of the environmental consequences of those contingencies.” *Vineyard Area Citizens for Responsible Growth v. City of Rancho Cordova* (“Vineyard”) (2007) 40 Cal.4th 412, 430-32.

The US Geological Survey Report, Groundwater Availability of the Central California Aquifer (USGS Report) ([http://pubs.usgs.gov/pp/1766/PP\\_1766.pdf](http://pubs.usgs.gov/pp/1766/PP_1766.pdf)) explains that increased regulation of water and environmental concerns in the Delta have resulted in reduced surface water deliveries both for urban and agricultural needs. USGS Report, Page 60. Future surface water deliveries therefore may not be available. Moreover, sustained increases in groundwater extractions are likewise untenable because “increased reliance on groundwater is likely to lower ground-water levels, thereby increasing pumping costs, inducing further subsidence, and decreasing surface-water base flows.” *Ibid.* Despite the RDEIR’s failure to adequately analyze regional water supply issues, it is clear that many communities may not be able to rely on increased groundwater extractions as their sole water source to meet future demand. The County, therefore, must analyze the likelihood of identifying alternative supplies, and consider the environmental consequences of obtaining water from such alternative sources.

**D. The EIR’s conclusion that implementation of the GPU will not increase groundwater demand beyond historical rates is not supported by substantial evidence or legally defensible arguments.**

126-34

The EIR concludes that “actions contemplated in the proposed project are not anticipated to cause overall demand in the County to vary from within the range of demands seen historically and documented by DWR.” RDEIR 3.9-47. This contention is both irrelevant and misleading. It is misleading because it ignores the fact that the GPU will cause a significant increase in the overall population of the County, which will in turn increase the demand for drinking water. It is irrelevant because the aquifer is in

Fred Brusuelas, Chief Planner  
Tulare County Resource Management Agency  
May 27, 2010  
Page 15 of 23

a state of overdraft. Adding more burden to an already overstretched aquifer will only result in more long-term deficits in the overdraft and the concomitant secondary impacts, such as subsidence and reduced pumping capabilities. As we will explain, the RDEIR must be revised to include an objective and honest evaluation of the expected increase in water demand and discuss whether and to what extent growth should be promoted in light of the deficiency in water supplies.

I26-34  
cont'd

A fundamental flaw in the RDEIR's water supply analysis is the failure to include concrete population projections. As it is, it is impossible to gauge the accuracy of the RDEIR's so-called "future scenarios" because it is not clear what assumptions inform these calculations. To comply with CEQA's basic informational requirements, the RDEIR must be revised to include accurate population projections to enable the public to check the veracity of the RDEIR's calculations. The RDEIR does actually include population projections at 5-2, Table 5-1. It should be noted that the RDEIR does not distinguish between growth projections under current conditions and growth that is specifically authorized and anticipated under the GPU. This is a fundamental flaw, which must be corrected. Assuming for the present purposes that the information in the RDEIR can be used to predict future water demand, why does the RDEIR not include a projection of future water demand based on these projections?

I26-35

The RDEIR makes an intellectually dishonest connection between future conservation measures and the implementation of conservation measures to address the County's water shortage. In this regard, the RDEIR states: "Land use changes contemplated by the General Plan Update provide an opportunity for the County to proactively implement available conservation measures." RDEIR at 3.9-45. As the EIR admits, the County is under a legal obligation to promote water conservation consistent with state law, as explained in the Water Report at page 12. The RDEIR fails to provide any explanation or analysis to show that without the land use changes contemplated by the GPU, the County could proactively implement the conservation measures required by law or otherwise available.

I26-36

Although difficult to follow, the RDEIR appears to argue that substantial increases in urban water demand will result, regardless of the implementation of the GPU. This conclusion seems *a priori* untenable. Instead of sanctioning the rapid

I26-37

Fred Brusuelas, Chief Planner  
Tulare County Resource Management Agency  
May 27, 2010  
Page 16 of 23

conversion of farmlands and paving the way for substantial population growth, the County could take a conservative approach by adopting policies that limit growth until and unless alternative supplies, that do not exacerbate the overdraft of the aquifer, are identified. Actively limiting population growth will surely reduce drinking water demand. The RDEIR's argument that the GPU does not play a role in the increase in future drinking water demand, therefore, is incomprehensible.

I26-37  
cont'd

If, as the RDEIR suggests, the projected growth will occur regardless of the GPU's land use policies and mitigation measures, why then does the County bother preparing an EIR at all? If the with and without project (i.e. with or without the 2030 GPU) that the same rate and pattern of growth will result, no environmental impacts can be attributed to the GPU and the County need only adopt a negative declaration, or perhaps even a notice of exemption, to explain this conclusion. But this is of course not the case, because the GPU's policies do direct the growth rate and pattern in the County.

Finally, the RDEIR's conclusion that "urban purveyors will be expanding water supply entitlements to the groundwater" is simplistic and has not been adequately explained. As the RDEIR notes, California is moving towards a statutory groundwater monitoring regime and it is unlikely and untenable to assume that water agencies may continue to expand groundwater extraction to meet urban needs, despite the worsening overdraft.

I26-38

Moreover, as the RDEIR notes in passing, increased levels of overdraft may result in lowering of water levels, increase pumping costs and degrade water quality -- water quality which is already poor in many communities in Tulare County. We therefore question the RDEIR's glib suggestion that future water demand will simply be met by water purveyors expanding their groundwater entitlement.

I26-39

**E. The RDEIR must analyze secondary impacts of the likely worsening of groundwater overdraft conditions.**

I26-40

In cursory fashion, the RDEIR admits that groundwater overdraft may result in (1) increase in pumping expense [due to the lowering of groundwater levels], (2) impacts to water quality, and (3) subsidence that can permanently decrease aquifer storage capacity and affect private property or public facilities and infrastructure. Besides

Fred Brusuelas, Chief Planner  
Tulare County Resource Management Agency  
May 27, 2010  
Page 17 of 23

noting the possibility that these impacts may result, the EIR does little to analyze the likelihood, extent or significance of these impacts.

I26-40  
cont'd

According to the USGS Report (cited above), "the droughts of 1976–77 and 1987–92 led to reduced surface-water deliveries and increased groundwater pumpage, thereby reversing the overall trend of groundwater-level recovery and **re-initiating land subsidence** in the San Joaquin Valley." As we explained above, the USGA Report explains that "increased reliance on groundwater is likely to lower groundwater levels, thereby increasing pumping costs, inducing further subsidence, and decreasing surface-water base flows<sup>1</sup>." The RDEIR, however, fails to analyze these potential impacts. Will the subsidence require significant expenditures of public funds to maintain public infrastructures such as roads and bridges? Will the subsidence pose a potential threat of rupturing gas lines or damage to dikes or dams? Will the increased cost of pumping groundwater cause significant hardship or make future development infeasible? Will degradation of groundwater quality cause violations of state and federal standards? How long before groundwater quality is so degraded as to require treatment? These are but a few of the myriad of potential issues that must be analyzed by the EIR before the County can make an informed and intelligent decision regarding the impact of proposed development on groundwater.

### Conclusion Regarding Water Supplies

I26-41

The RDEIR's water supply analysis is inadequate as a matter of law. The County has failed to calculate future demand and has failed to identify existing supplies. There is no individualized analysis of groundwater conditions for the many communities where increased future development is anticipated under the GPU. The EIR has failed to analyze the secondary impacts of the increased groundwater pumping and has failed to identify alternative water supplies that could replace the depleted groundwater supplies or reduced future surface water deliveries. Moreover, it simply does not suffice for the RDEIR to conclude that "the hydrologic implications of increased localized

<sup>1</sup> / Note that while the USGS Report states that these secondary impacts are "likely", the RDEIR merely states that these impacts "may" occur.

Fred Brusuelas, Chief Planner  
Tulare County Resource Management Agency  
May 27, 2010  
Page 18 of 23

pumping in groundwater basins (i.e. potential for cones of depression) is not known".  
The RDEIR's analysis of water supplies must be substantially revised.

I26-41  
cont'd

### ALTERNATIVES

#### **The EIR does not consider a reasonable range of alternatives.**

I26-42

Pursuant to CEQA, the RDEIR is required to identify a range of alternatives that could reduce or fully mitigate the Project's environmental impacts. An EIR must

"describe a range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project, and evaluate the comparative merits of the alternatives." (CEQA Guidelines, § 15126.6, subd. (a).)

It must contain

"sufficient information about each alternative to allow meaningful evaluation, analysis, and comparison with the proposed project." (CEQA Guidelines, § 15126.6, subd. (d).)

"The statutory requirements for consideration of alternatives must be judged against a rule of reason." Citations omitted.

*Association of Irrigated Residents v. County of Madera* (2003) 107 Cal.App.4th 1383, 1400 ("AIR")

An EIR "must explain in meaningful detail ... a range of alternatives to the proposed project and, if [the agency] finds them to be infeasible, the reasons and facts that [the agency] claims support its conclusion." *Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal.3d 373, 407.

The EIR must focus on alternatives that can avoid or substantially reduce a project's significant environmental impacts. Public Resource Code §21002.

The EIR must compare the merits of each feasible alternative and explain in some detail how the alternatives were selected. CEQA Guideline 15126.6.

Fred Brusuelas, Chief Planner  
Tulare County Resource Management Agency  
May 27, 2010  
Page 19 of 23

In other words, the alternatives considered in the EIR must offer a substantial advantage over the proposed project. Citizens of Goleta Valley v. Board of Supervisors (1990) 52 Cal.3d 553, 566.

I26-42  
cont'd

It is imperative that the discussion of alternatives include sufficient information about each alternative to allow evaluation and comparison of alternatives to the Project. CEQA Guideline 15126.6(d). AIR, supra.

The EIR's alternatives analysis must contain "sufficient information about each alternative to allow meaningful evaluation, analysis, and comparison with the proposed project." [Citation.]")

Moreover, the range of alternatives must be sufficiently varied to foster informed decision-making and public participation. CEQA Guidelines §15126.6(a)-(f); Mann v. Community Redev. Agency (1991) 233 Cal.App.3d 1143, 1151.

The alternatives considered in the EIR fail the CEQA standard. The alternatives proffered by the County fail to meaningfully reduce the GPU's myriad of significant environmental impacts. As evidenced by Table 4-1, at 4-4, all alternatives considered by the RDEIR will result in substantial increase in population growth. These alternatives fail to foster meaningful decision-making or public participation because they are too similar. Moreover, only one of the alternatives considered meets all of the County's stated goals for the GPU. The RDEIR, therefore, violates CEQA in that none of the alternatives appear to meaningfully reduce the Project's environmental impacts, and all but one of the alternatives are designed to meet the Project's stated objectives.

Moreover, the County has failed to explain why "The Healthy Growth Alternative," which was offered by Tulare County Citizens for Responsible Growth in comments on the 2008 DEIR, was never considered. The Healthy Growth Alternative meets the definition of a potentially feasible alternative in that it meets most of the County's stated objectives. Yet this alternative is "environmentally superior" because it would reduce many of the GPU's significant environmental impacts. The County must consider and discuss a range of alternatives, including the Healthy Growth Alternative

I26-43

Fred Brusuelas, Chief Planner  
Tulare County Resource Management Agency  
May 27, 2010  
Page 20 of 23

proposed by members of the public. At a minimum, the EIR must explain why this alternative should be considered infeasible or otherwise rejected.

I26-43  
cont'd

The RDEIR's analysis of alternatives is further flawed because the analysis is often supported by conclusory statements intended to support the County's preferred alternative. For example, the RDEIR fails to include a discussion of the fire risk of each alternative, particularly at the wildland-urban interface. In places, the discussion of hydrology and water quality approaches not only the disingenuous, but nonsensical.

I26-44

In many instances, the RDEIR fails to adequately explain and understates the difference between alternatives without any persuasive or adequate explanation. The EIR claims, for example, that the potential hydrology and water quality impacts that could result from the so-called "City-Centered Growth Alternative" would be similar to the impacts from more extensive development in the foothills and mountains. Clearly, more intensive development in the less-developed foothills and mountains would result in much more extensive impacts on water quality in rivers and creeks. Yet, without any explanation, the RDEIR concludes that the opposite is true. The RDEIR must be revised to provide more extensive and meaningful information in order to permit a genuine comparative analysis of the proposed alternatives. CEQA Guideline 15126.6(d).

I26-45

Likewise, the RDEIR's conclusion that various alternatives would result in similar impacts on climate change and air quality is poorly explained. The RDEIR states that the confined growth alternative "may reduce the overall number of vehicle miles driven," and thereby reduce both the GHG and criteria and toxic emissions (RDEIR at 4-33-35). The RDEIR then goes on to conclude that these reductions would be essentially meaningless because, in each case, the Project would still result in significant adverse impacts on climate change and air quality. This "analysis" is misleading and inadequate in that fails to provide the reader with any sense of the magnitude of benefit that may be realized from the reduction in the overall vehicle miles travelled (VMTs). That the Project's overall impact may remain significant, even with reductions in the VMTs, is not determinative. The public and the County policy-makers must be able to meaningfully compare the environmental benefits of each alternative even if the overall impact may remain significant.

I26-46

Fred Brusuelas, Chief Planner  
Tulare County Resource Management Agency  
May 27, 2010  
Page 21 of 23

The RDEIR must be revised to include a legally sufficient alternatives analysis that includes a reasonable range of feasible alternatives that would meaningfully reduce the Project's environmental impacts.

I26-47

## CLIMATE CHANGE

The RDEIR admits that the implementation of the GPU would result in a significant adverse impact on climate change and concludes that this impact must be mitigated as required by CEQA. For example, at 3.4-32, the RDEIR admits that Tulare County's CO<sub>2</sub> emissions will increase from 5.2 million tons per year in 2007 to 6.1 million tons per year in 2030, an increase of 897,420 metric tons per year or 17% increase greenhouse gas (GHG) emissions.

I26-48

To meet the goals of AB 32, the State must reduce GHG emissions to 1990 levels by 2020. While it is becoming increasingly clear that even achieving the goals of AB 32 may not avoid a catastrophic climate change outcome, it is imperative for all land use agencies, such as Tulare County, to make a genuine effort at least meet the goals set by this state law. Unfortunately, Tulare County does not appear to be ready to meet this challenge as the RDEIR admits that GHG emissions that will result from the GPU "places the proposed project in conflict with the (2020) goal of the State to reduce up to 174 million metric tons CO<sub>2</sub>e/yr." Tulare County is therefore in violation of state law as there are many feasible mitigation measures that can help Tulare County meet its obligation to reduce GHG emissions. Sierra Club has submitted a comprehensive list of resources and mitigation measures to assist the County.

The RDEIR itself includes many sensible and established policies to address climate change. Unfortunately, as with other GPU policies, these proposed policies do not include mandatory terms such as "shall" and are therefore illusory and unenforceable. We suggest that these policies be revised to include mandatory terms. Moreover, we suggest that if the County intends to rely on the CAP as an implementation plan for climate change mitigation policies, the CAP must be finalized and adopted before or at the same time as the GUP itself.

I26-49

Fred Brusuelas, Chief Planner  
Tulare County Resource Management Agency  
May 27, 2010  
Page 22 of 23

Without any adequate explanation, the County's draft Climate Action Plan (CAP) sets a 26.2% target for reductions in Greenhouse Gas (GHG) emissions. It may be that the CAP assumes this target to be the maximum feasible mitigation target, but it is impossible to evaluate this implicit contention as the CAP does not provide any supporting evidence or arguments. If the County contends that full mitigation of the Project's GHG emissions requires only a 26.2% reduction from business as usual (BAU), this contention needs to be vetted and supported by evidence.

I26-50

We suspect that the draft CAP adopts a target 26.2% CO<sub>2</sub> emission reduction from BAU as a means to comply with AB 32's 2020 emission reduction targets. This would be mistake, however, because (a) the most recent evidence shows that compliance with AB 32 would not avoid catastrophic outcomes of climate change and (2) AB 32's emission reduction goals mark only a first and interim step toward much more significant eventual GHG reductions. By myopically focusing on AB 32's 2020 goals, the County seems to ignore the long-term emission reductions necessary to stabilize the climate or even to meet the 2050 goals.

Moreover, the planning horizon for this project extends to 2030, 10 years beyond the 2020 goal for which the measure is tailored. Greenhouse gas emission reduction targets also extend beyond 2020 and are much larger than the 2020 target; Executive Order S-3-05 sets an 80% reduction of GHG from 1990 levels in 2050 as a goal. In order to achieve GHG emission reduction goals beyond 2020, the County should require feasible mitigation measures that would reduce development related GHG emissions beyond the 26.2% below BAU 2020 requirement.

I26-51

CEQA defines "feasible" as "capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, social and technological factors." PRC §21061.1. The fact that an alternative or mitigation may be expensive or make the project less profitable is insufficient to show financial infeasibility. Uphold Our Heritage v. Town of Woodside, (2007) 147 Cal.App.4<sup>th</sup> 587, 599. "What is required is evidence that the *additional* costs or lost profitability are sufficiently severe as to render it impractical to proceed with the project." Id. Here, if the County contends that full mitigation of GHG mitigation is

I26-52

Fred Brusuelas, Chief Planner  
Tulare County Resource Management Agency  
May 27, 2010  
Page 23 of 23

financially infeasible, it must support this contention with evidence to show that the additional costs of such mitigation would render it infeasible.

I26-52  
cont'd

**CONCLUSION**

For all these reasons, we urge the County to revise and recirculate the RDEIR.

I26-53

Sincerely,

**ORIGINAL SIGNED**

RE: Sequoia Riverlands Trust Comments on Tulare County General Plan Update

Dear Mr. Bryant,

I submit the following comments on the Tulare County General Plan Update on behalf of Sequoia Riverlands Trust. We are a regional, non-profit land trust dedicated to conserving the natural and agricultural legacy of the southern Sierra Nevada and San Joaquin Valley. We protect working landscapes, habitats and scenic open space while supporting sustainable economic growth in our communities. Our geographic reach includes primarily Tulare, Fresno, Kern and Kings Counties. Our approach is to engage farmers, conservationists, landowners, the public sector and the business community in a collaborative approach to land and resource conservation in the Sierra Nevada foothills west of federal land boundaries and on the Valley floor. We therefore have a deep and urgent interest in the Tulare County General Plan Update. In this spirit, we offer the following comments on the nature and provisions of this plan update:

127-1

1. Scope and Content

127-2

The Introduction to the General Plan Update must further clarify both scope and content of the Plan in several respects. First and foremost, we ask that you clarify what is actually included in the Plan and thereby in the requirements for consistency determinations. For example, the current explanation does not adequately cover the land use "diagrams" or the Implementation Measures. Are the many "diagrams" merely illustrative or do they direct land use? Regarding the Implementation Measures, the Plan states that they may be changed without amending the General Plan. This means they are not formally or legally considered to be a part of the Plan. If that be the case, they could be changed, for instance, by staff without any notice or comment or any public discussion at all. However, much of the concrete content of the Plan is in these measures. Everyone should be able to count on them; they should be part of the General Plan. We believe change in Implementation Measures should be subject to public review and comment.

127-3

We ask that the Implementation Measures be made explicitly part of the Plan and that clarification of their status be made explicit in the Introduction to the Plan Update.

127-3  
cont'd

## 2. Foothill Growth Management Plan (FGMP)

127-4

From the beginning of the Plan Update process, the Board has repeatedly said that the FGMP is not subject to update this time around. As recently as April of 2008 I have had this in writing from RMA senior staff. However, this Plan Update shows that a "revised" form of the FGMP was actually **adopted** this year, 2010 (Page 1-3)!! If this be true, it was done without public knowledge, notice or participation. We thereby question the legality of this action.

Part II, Chapter 3 indeed shows considerable, significant change from the plan adopted in 1981. For instance, in substance the land use designations Foothill Agriculture (FA) and Foothill Mixed Use (FMU) are entirely new from the perspective of the original FGMP. The FA designation allows one unit for each forty acres above 160 acres, which means that large foothill ranches could be subdivided into large parcel subdivisions that scatter dispersed development throughout the foothills of Tulare County. This is directly counter to the governing idea of the 1981 FGMP which was to focus development in development corridors, leaving about 90% of the foothill area in agricultural use. Foothill Mixed Use is similarly an entirely new concept for the foothills. This category includes, residential, commercial, recreation and light industrial uses where residential and some very, very limited neighborhood commercial uses were allowed under the original FGMP.

127-5

Important natural resource considerations such as riparian protection have also been changed beyond recognition. For example, under the 1981 FGMP 100 foot riparian protection zones were required. The General Plan Update only says foothill areas adjacent to a water course shall remain in common open space (Part II Page 3-29), but there is no operational definition of how much land adjacent to a water course shall remain in common open space or how it is to be managed. The presumably complementary language regarding riparian zone protection in Part I is very general except for riparian zones in recreational developments which are required to be 100 feet (Page 8-16). Inexplicably, industrial uses may not be required to protect that same 100 feet of riparian area (Page 8-16).

127-6

These changes in allowable foothill land use and development standards amount to a complete rethinking of the future of the foothills, done without any public input at all. It is a betrayal of the foothill communities and of all with an interest in the foothills to say one thing, i.e., to say there would be no change in the FGMP as part of this general plan update, and then to do another, i.e., make those substantial changes without any public input. We therefore ask that the process be backed up, that Part II Chapter 3 of the Plan Update be shifted to Part III and dealt with subsequently in a fully open public process just as the other areas identified in Part III that are not yet adopted.

127-7

### 3. Agricultural Land Mitigation

127-8

We agree with Plan policies regarding conservation easements (Page 3-5) but urge that the stronger implementation language at 3.3.1 (Page 3-9) be adhered to. The County should indeed take the lead in establishing a comprehensive agricultural land mitigation program to offset impacts of agricultural land conversion to urban uses. Further, we would be happy to participate in the establishment of criteria for the locations of agricultural conservation easements (Page 3-10) and we applaud the monitoring and annual reporting requirements (Page 3-10). We note that the latter two are Implementation Measures which apparently are not part of the General Plan. We believe they should be.

### 4. Smart Growth

127-9

We applaud the policies outlining a start toward Smart Growth, but once again believe that the more specific language in the Implementation Measures should be included in the Plan itself. Accordingly, we believe that, as appropriate, smart growth principles should be incorporated as conditions of project approval (Page 4-33); that a cluster development ordinance should be prepared (Page 4-36); and that Open Space and Land Conservation contracts should be reinstituted (Page 4-34). We believe that these first few steps toward Smart Growth should only be the beginning, not the end, of progress in this direction. We look forward to working with the County to strengthen our community's further development of Smart Growth policies.

### 5. Biological Resources:

127-10

We are heartened that the "...County shall support..." the preservation and management of wetland and riparian plant communities, the establishment of mitigation banking programs, and the conservation and management of oak woodland communities (Page 8-10). We are disappointed that these policies are so general as to be without any real force or effect. Once again, the Implementation Measures include specific language that should be a part of this General Plan Update, specifically, resource determinations by qualified professionals, e.g., biologists; designation of Resource Conservation Areas; a mitigation banking program; dedication of riparian and wetland areas; preservation of vernal pools; replacement planting of native oaks; and possible adoption of an oak woodlands management plan pursuant to the Oaks Woodland Conservation Act of 2001 for the purpose of qualifying for State funding (Pages 8-21 through 8-24).

The latter is of particular interest and particular disappointment to us at SRT. Starting five years ago, at the request of this Board of Supervisors, specifically Jim Maples, SRT attended a number of meetings regarding oak preservation and proposed language

127-11

consistent with this Act. Despite repeated communications starting in 2005, nothing has come of this effort. We ask that the feasibility study of adoption of an oak management plan be set aside and that the language we proposed for developing it simply be adopted. Failing this, we at SRT stand ready to participate in whatever process is necessary to get a countywide oak management plan done. Losing our County's oakwoodlands through delay or sheer negligence is not an acceptable option to us.

I27-11  
cont'd

We are further concerned that the needs of the aggregate industry appear to trump all or most environmental resource considerations, especially in riparian areas. Generally, requirements accommodating the mining industry account for fully one third of ERM Implementation Measures. While these measures may not be a part of the general plan, such an imbalance suggests a general bias in favor of the mining industry. There are specific instances of bias as well. Implementation Measure 30 (Page 8-27) requires that development of areas adjacent to waterways with aggregate potential be planned so as not to hinder future extraction of commercially important minerals. Yet Measure 9 (Page 8-23) requires that the Zoning Ordinance require "...dedication of buffers as public open space for riparian and wetland areas for development or other discretionary permits where the development or activity will impact a riparian area." Aggregate mining is subject to permit therefore these two appear to be in conflict. Will such conflicts be "resolved" through staff rewrites of Implementation Measures without public involvement, review and comment? Once again, the ambiguous status of the Implementation Measures is problematic. We ask that this be clarified in the final version of the General Plan Update.

I27-12

## 6. Water Resources

The Water Resources section is more complete than the last draft and generally easier to understand. That said, we are concerned that non-restrictive language in some sections gives this General Plan Update little force and effect regarding water. For example, the document admits that Tulare Lakes Basin, much of which lies within Tulare County, accounts for fully 56% of the total Statewide overdraft (Page 11-3), thereby defining the magnitude of the County's overdraft problem. Yet, Plan direction regarding water quality and supply is largely "promote," "support," "encourage", and/or "should" (Page 11-6 through 11-10). Surely in a county where water is such an issue we can do better than this!

I27-13

While we are disappointed by generally weak language, we applaud the apparently strong language of a few of these policies, e.g., the requirement for a Will-Serve letter and actual evidence of sustainable water supply for new development applications (Page 11-9). On the other hand again, we are concerned that there is no definition of "major" for WR-2.1 (Page 11-8): "All **major** land use and development plans shall be evaluated as to their potential to create surface and groundwater contamination...from point and non-point sources." (Emphasis added). We believe that in the absence of a definition, the word "major" should simply be deleted. As a county, we should be unambiguous about

I27-14

our water requirements and in no doubt as to the water quality and quantity implications of new development.

127-14  
cont'd

Once again, the specifics of the Implementation Measures seem to us to hit the mark where the policies fail for lack of specificity. We recommend in this case---Water--- that every one of the Implementation Measures be adapted and incorporated as Plan policy. Regarding Measure 27, we recommend that the study be broadened to include defining the system of water supply, transfer, and recharge areas countywide. Looking only at the areas of inadequacy prevent full problem solving and the possibility of synergy. We further believe that such a countywide study would lead to development of a system of "green infrastructure" starting with protected riparian areas on federal land, continuing onto the Valley floor, and dedicated to water supply and quality enhancement, habitat and recreational values. Of note: Before the Technical Advisory Committee was disbanded, this idea of "green infrastructure" was supported by such widely divergent views as those of public land managers and representatives of aggregate mining. We believe integrative conservation is an idea whose time has come. We stand ready to participate in whatever public forum is established for the purpose.

127-15

#### 7. Urban and Wildland Fire Hazards

127-16

Section HS-6 (Page 10-10 through 10-12) gives the barest outline of a wildland fuels policy. Since several of our preserves are located in the foothills in high hazardous fuels areas, we are concerned about these policies, particularly in the context of the possibility of large parcel subdivision of the entire foothill area. We are concerned about fires originating on other's property and burning onto ours. Specifically, we are concerned that HS-6 does not state policies that would adequately prevent fires originating in structures/property and burning onto adjoining wildland properties. We are particularly concerned that HS-6.2 "promotes" but does not "require" fire resistant materials in fire hazard areas. We recommend that such materials are required. We similarly believe that HS-6.6 requiring fire management plans should apply to all large parcel subdivisions since inevitably most of the land will be left in wildland vegetation and will probably not be managed. Finally, we recommend that HS-6.15 be expanded to include fuel related hazards on private lands because much is accomplished through such entities as Fire Safe Councils whose projects are often premised on partnering public and private efforts to benefit public and private lands.

In summary, we believe this General Plan Update document is better organized and more understandable than the previous drafts, for which we thank you and the staff of the RMA. There is a good reason this hugely complicated update has taken a great deal of time. However, we have major objections and recommendations as detailed above. We believe a Plan should support good decision-making, but doubt this one, as written, can do so because it is ambiguous and vague.

127-17

We thank you for the opportunity to comment on the General Plan Update. We note that while we have confined our comments to the Plan itself and submitted them after comments were due for the DEIR, you personally (Telephone call with yourself, David Bryant, 5/26/10) assured us that our comments would be included with all other comments on the Plan Update as part of the official record. We understand that a published point for point response will not be published with the FEIR, and we agree that in fact there is little response of a technical nature even possible given the nature of our comments. We look forward to participating further in a thorough public vetting through the public hearing process and to a much improved Plan at the end of that process.

127-18

Sincerely yours,

JULIET B. ALLEN

# TULARE COUNTY FARM BUREAU

*Mission: to promote and enhance the viability of Tulare County agriculture.*

May 27, 2010

Tulare County Board of Supervisors  
Administration Building  
2800 West Burrel Ave.  
Visalia, CA 93291

and

County of Tulare  
Resource Management Agency  
Attn: David Bryant  
5961 So. Mooney Blvd.  
Visalia, CA 93277

RE: Tulare County General Plan and Recirculated Draft EIR Comment Letter

Dear Supervisors and County Planning Staff,

Tulare County Farm Bureau is a voluntary non-governmental agricultural organization representing more than 2,700 members in Tulare County. On behalf of our Farm Bureau's Land Use Committee, thank you for the opportunity to comment on the Tulare County General Plan Draft EIR. We applaud the county's efforts to create a General Plan Update that identifies protecting agriculture as one of the guiding principles of the general plan framework, as agriculture is the most important economic engine accounting for a large portion of employment and economic viability in Tulare County.

I28-1

Mr. Bryant was available on two occasions to meet with the Tulare County Farm Bureau's land use committee and concerned citizens and members of the Farm Bureau this past month, with the second session occurring on the afternoon of May 27, 2010. We appreciate Mr. Bryant's availability to meet and review the extensive documents with our members and offer the following comments to reinforce comments submitted in April 2008.

## **Goals and Policies Report 2010**

The Tulare County Farm Bureau Board of Directors [Farm Bureau] have adopted the following Land Use Policies to protect the rural lifestyle of Tulare County, provide open space with a working landscape, and encourage the continued production of high quality, low cost food in the most efficient, responsible and profitable manner possible. The demand and need for food will increase with the anticipated worldwide growth in population. Therefore, land use decisions must recognize that agricultural lands comprise an important strategic national resource as well as providing national security and domestic products we all consume every day.

I28-2

The policies noted below are our basis for our comments and assertions about the Goals and Policies Report and the recirculated draft EIR document and will serve as our recommendations for language to be adopted in the Final EIR and County General Plan.

128-3

- *Agriculture is a basic industry making an invaluable economic contribution to the local economy and encroachment of incompatible uses into agricultural areas should be prevented.*
- *Agricultural planning and allowed land uses in agricultural zones should be driven by agricultural needs.*

128-4

In the Goals and Policies Report, Agriculture Element, the County should incorporate into the final EIR and General Plan Update language that provides that guidelines be established to adequately address and minimize or prevent impacts associated with operating rural assemblages of people “party barn” facilities and address issues associated with traffic congestion, noise, hours of operation, and set up and tear down that the permitted facility could have on surrounding land owners. **Farm Bureau applauds the County for enacting a moratorium on these permits until a suitable ordinance can be established.** Agricultural producers in the area may be restricted in their ability to perform timely cultural practices, chemical and nutrient applications and coordinate harvesting activities on their properties with the introduction of a facility such as this. Currently there are no guidelines in place to scrutinize an application for a “party barn” in a rural setting. Section 16, page 9 titled *Variances and Special Use Permits* of the current Zoning Ordinance of Tulare County provides broad interpretation of allowable uses for a special use permit for assemblage of the public, and does not exclude granting permits for entertainment facilities on AE zoned land. This concerns Tulare County Farm Bureau and should be incorporated into the final GPU adopted so that new zoning law can be created that would address permitting issues that arise for rural assemblage of people for education and entertainment venues. **When possible, permitting of these facilities should be strictly prohibited on AE zoned lands unless no impacts to agriculture and neighboring land owners would be apparent. In order to avoid many of these conditional use permit issues, it is recommended that the Rural Valley Lands Plan scoring criteria be required in assessing permitting requests for rural entertainment facilities and other special use permit requests, even when a zone change request is not initiated.**

- *Economically productive agricultural land shall be recognized and accorded with a high priority in land use planning and by agricultural zoning. We support the continued use of the Rural Valley Land Plan to accomplish this process.*

128-5

Farm Bureau recommends that if a Conditional Use Permit is designated for something other than agriculture production, or something not incidental to agriculture on AE zoned land and then abandoned the permit should become void for that facility and a new permit required, thus triggering the RVLP property scoring process. Currently many Conditional Use Permits are granted and the RVLP is not triggered, and Farm Bureau believes it should be strictly applied to all conditional uses on AE zoned land **even when a zone change request is not initiated.**

CFBF Policy No. 147 states, “Whenever special conditions are attached to variances they should be specific and deal solely with mitigation requirements that arise from granting the variance. Conditional use permits should not be used to address unrelated social ills. Conditional use permits should not be

*more restrictive than established in current California state or federal law, unless they are necessary to address specific local situations."*

I28-5  
cont'd

- ***Tulare County Farm Bureau supports local planning that accommodates orderly, logical contiguous patterns of urban development, in order to prevent premature and unnecessary conversion of productive agricultural lands to non-agricultural uses.***

I28-6

In reviewing the Tulare County 2010 Goals and Policies Report, we applaud your efforts to discourage New Towns (PF-5.1) and offer California Farm Bureau Policy Language No. 150 to support this objective in the plan. *"New towns should only be allowed in areas that are not suitable for agriculture. However, in the event new towns are proposed, they should be located and designed to assure that adverse impacts on agricultural land, such as competition for water, can be satisfactorily mitigated. Furthermore, the town's drainage should dispose of its salt load without causing long term salinity problems either in groundwater or in downstream surface waters. They should be self-supporting in typical city services and utilities required, including, but not limited to, schools, police and fire protection and sewer, water and solid waste disposal, and established on existing public roads or transportation corridors. In addition, any new town proposal should also be required to plan for an appropriate ratio of employment opportunities to residents and provide housing for all, including persons providing services within the community. We support limiting entitlements for new towns to five years unless infrastructure is installed and lots are sold."* CFBF Policy No. 150, 2010 Policy Book.

Also under the Planning Framework of the Goals and Policies Report we support the new policy statement that the "County shall promote consultation early in the planning process between the cities and the County at the staff level when cities are developing proposed annexation boundaries or proposed sphere of influence expansions. CFBF Policy No. 152, section 3 states *"We support local planning which accommodates orderly, logical contiguous patterns of urban development. To help contain urban sprawl and protect our agricultural resources, responsible government agencies should discourage urban development of agricultural land unless the local jurisdiction has demonstrated efficient use of existing incorporated areas. The LAFCO should be required to recognize existing infill and density with specific evaluation of findings of each prior to approving a petition or application for a sphere of influence change, annexation, or other action that includes productive agricultural land."* CFBF Policy No. 152, 2010 Policy Book.

Farm Bureau encourages the County to invest in the necessary staff and technical resources to track the conversion of local agricultural land to other uses to include urban and non-urban uses on a real time basis, so that we can make land use decisions without depending on out of date and less reliable statewide data.

- ***Efficient land use plans for existing cities and towns should emphasize infill development, redevelopment, and increased densities to preserve farmland. They should encourage efficient use of public services, promote affordable housing, and conserve energy and natural resources. We oppose the establishment of urban "leap frog" development.***

I28-7

Farm Bureau discourages the premature conversion of agricultural lands to urban uses, and recommends offsetting unavoidable impacts to agricultural lands with effective mitigation measures such as conservation and agricultural easements and suggests working with the Local Agency Formation Commission (LAFCO) and the incorporated cities to develop sound uniform policies for protecting farm

land. Farm Bureau would like to participate in the development of a comprehensive agricultural land mitigation program with the county and incorporated cities.	I28-7 cont'd
<i>Non-farm related developments should not be deemed compatible in agricultural zones if the proposed use significantly compromises the productive capability of the parcel or the agricultural zone; displaces or impairs agricultural operations in the area; or induces nonagricultural growth or intensifies pressure for conversion of other lands from agriculture.</i> CFBF Policy No. 144, 2010 Policy Book.	I28-8
In further preserving farm land, the land division section of each of the AE zones should be carefully reviewed to prevent further parcelization from occurring.	
<ul style="list-style-type: none"> <li>▪ <b><i>Parcelization of agricultural lands into non-viable commercial agricultural units should be discouraged and prohibited whenever possible to maintain the viability of commercial agriculture.</i></b> Farm Bureau supports review and amendment of the Division of Agriculture Lands, Section 15.D.2 Homesite Parcel Ordinance to best accomplish this purpose and to minimize parcelization.</li> <li>▪ <b><i>Tulare County Government should participate fully in the Williamson Act and the Farmland Security Zone Act. Local agricultural property owners should be encouraged to participate.</i></b></li> </ul> <p>In the Goals and Policies Report, Agriculture Element (AG-1.5) Substandard Williamson Act Parcels, Farm Bureau supports this new policy to remove parcels that are less than 10 acres in Prime Farmland and less than 40 Acres in Non-Prime Farmland from Williamson Act Contracts to help protect the integrity of this important conservation program.</p> <p><i>"The cancellation of Williamson Act contracts should only be approved under extraordinary circumstances. The non-renewal process represents a landowner's contractual right and is the preferred method of exiting a Williamson Act contract. We view inappropriate cancellations of Williamson Act contracts as a violation of those contracts between the landowner, county and state."</i> CFBF Policy No. 148, 2010 Policy Book</p> <p>Farm Bureau also encourages the County to address the ex-urbanite or <i>suburban rancher</i> issues that are emerging in our rural areas, these issues of <i>ranchette</i> development should be addressed through thoughtful, deliberate, and clear enforcement of the Rural Valley Lands Plan scoring process and enforcement of the Williamson Act through its prescribed uses.</p>	I28-9
<p><i>"The cancellation of Williamson Act contracts should only be approved under extraordinary circumstances. The non-renewal process represents a landowner's contractual right and is the preferred method of exiting a Williamson Act contract. We view inappropriate cancellations of Williamson Act contracts as a violation of those contracts between the landowner, county and state."</i> CFBF Policy No. 148, 2010 Policy Book</p>	I28-10
<ul style="list-style-type: none"> <li>▪ <b><i>Buffers that protect agricultural operations should be incorporated into Building Standards and included into the Zoning Ordinance and/or General Plan for those parcels that are non-conforming due to size or use.</i></b></li> </ul> <p>In the Goals and Policies Report, Agriculture Element (AG-1.11) Agricultural Buffers, Farm Bureau supports employing agricultural buffers between agricultural and non-agricultural uses. Farm Bureau applauds 4.5 Implementation Measure 9 which reflects buffer language submitted on behalf of the Ag Buffer Sub Committee of the Tulare County Farm Bureau. However, the statement that the County "shall consider" adopting a buffer policy is not enough, it is important that the implementation policy reflect stronger and more coherent language to direct staff to implement a buffer policy.</p>	I28-11

## Other General Comments on Goals & Policies Report

## **3. Agriculture Element**

TCFB suggests that the Williamson Act-Prime Agricultural Land qualifications on page 3-3 for prime classification be clarified to read that not all criteria must be met, but that one of the following qualifications apply. For example, land of local important and in particular citrus and olive trees may be considered prime farmland but may be planted on Class 3-4 soil types, and these lands should be appropriately classified under this definition.

I28-12

AG-2.11 – TCFB suggests that this statement on page 3-8 be clarified to strengthen the intent of the language to reflect that new energy projects related to agriculture may be encouraged and supported if the energy production is incidental to the agricultural business on the land. Farm Bureau does not support energy facilities being placed on Williamson Act contracted farm land that would displace, impair, or remove a large percentage of the agricultural production on the land.

I28-13

Ag Implementation Policy 13 on page 3-12 should be clarified to reflect Farm Bureau and CA Department of Conservation interpretations that land under Williamson Act contract are not suitable for large scale solar facilities which will displace agricultural production. The statement “agriculturally related energy production industries” should expressly define energy production that is incidental to an agricultural operation, not to be interpreted as land that can be converted for energy production that would displace agriculture production.

I28-14

## **8. Environmental Resources Management Element**

In the Goals and Policies Report, Environmental Resources Management Element (ERM-5.7) we encourage the County to more adequately define the term “water courses.” We further suggest that public access as stated in ERM-5.7 be in accordance with private property rights. The policy statement should also speak more specifically to the acquisition of parks or other recreational areas.

I28-15

Policy 5-18 (ERM) - Farm Bureau supports adding additional language to this new policy that would provide for an exemption for agricultural operations that operate during nighttime hours and for security reasons.

I28-16

## **11. Water Resources Element**

Tulare County Farm Bureau commends the County for incorporating a water element into their 2010 goals and policies report. WR 1.4 (second bullet point) is unclear. “The reduction in infiltration from agricultural activities as a source of groundwater recharge will not significantly impact the groundwater basin.” Farm Bureau requests further clarification of the intent of this statement.

I28-17

WR 1.10 – Farm Bureau suggests that channel modification be discouraged **except for flood management and maintenance**. Farm Bureau suggests that this language be added to the policy statement WR 1.10.

I28-18

WR 2.8 – Farm Bureau suggests that the County may want to revise language in this statement to avoid over-committing the County to a mitigation and monitoring obligation they may not be able to maintain.

I28-19

WR 3.7 – Farm Bureau suggests defining and spelling out what County operated water systems are being specifically referenced in this statement. Furthermore, the emergency water conservation plan should exclude agriculture pumping.

I28-20

**Suggested Dairy Element / Confined Animal Facility Plan**

Tulare County Farm Bureau recommends adding a Dairy Element to the final General Plan that is adopted to help promote an orderly, predictable planning process for the dairy industry and establish a programmatic EIR process that all dairies can utilize to comply with rigorous permitting requirements. Tulare County is home to the largest dairy industry in the United States, our number one commodity is Milk Products with a value of more than a billion dollars. Farm Bureau supports the Dairy CARES initiative to amend the General Plan to develop a comprehensive and streamlined approach for dairy operation permitting requirements.

128-21

**Part II – Chapter 1. Rural Valley Lands Plan**

Farm Bureau commends the County for continuing to maintain and protect the integrity of the RVLP process. Farm Bureau maintains that the RVLP should be the guiding document for many land use decisions, and we are pleased that the entire document is contained in the 2010 goals and policies report. We contend however that the RVLP should be used to score land application requests that occur in Hamlet Development Boundaries, as these arbitrary lines do not accurately reflect the availability of urban services into these areas, and an RVLP score could be an objective way to score the merits of a development proposal.

128-22

RVLP 1.6 Checklist – a typographical error in the word “forth” should be corrected to reflect “forty”. A citation should also be added to reflect the NRCS definition of “prime ag land” is being used.

128-23

**General Plan Update Alternative – RDEIR, 2010**

In reviewing the GPU Alternatives proposed in the recirculated Draft Environmental Impact Report (RDEIR), **Farm Bureau maintains our position that Alternative 5, the Confined Growth Alternative, is the alternative that would most effectively direct growth to established Urban Development Boundaries based on the assumption that boundary expansion would only be allowed under a “no net gain” scenario.** Under the “no net gain” scenario, modifications to the “hard boundaries” which are defined as UDBs and Hamlet Boundaries, can only be modified if they are offset by equivalent deductions in boundaries elsewhere. Farm Bureau supports the spirit of this alternative, however is cautious that “hard boundaries” can also lead to leapfrog development, and this should be strongly discouraged if this alternative is adopted.

128-24

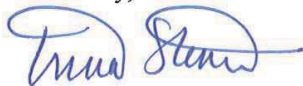

Farm Bureau supports this GPU alternative as a preferred method for protecting prime farmland and as the environmentally superior alternative, converting less open space, and proposing fewer environmental impacts and reducing the severity of those impacts that are unavoidable. The Confined Growth Alternative is a preferred plan for protecting agriculture as it identifies fewer impacts significant to agriculture than the GPU suggests in the conversion of important farmland to non-agricultural uses.

Thank you for allowing Tulare County Farm Bureau to comment on this important planning document. The Final EIR must present a General Plan that clearly directs growth into those cities and communities that have the desire and capacity to accommodate that growth and by doing so firmly protects our agricultural and natural resources. By adopting a General Plan that strongly directs growth into our existing urbanized areas, is internally consistent, ensures that all communities are adequately addressed regardless of size, and is one that provides a vision and framework for the future growth of Tulare County, Farm Bureau is confident in supporting a final product that will ensure and enhance the viability of agriculture.

128-25

The Tulare County Farm Bureau is proud of the comprehensive policies we have adopted over many years to help assist counties and cities in their planning efforts best protect agricultural lands and resources necessary for farming to be viable in Tulare County. | I28-25  
cont'd

Sincerely,

PATRICIA L. STEVER  
Executive Director

# CHAPTER 4

---

## Master Responses

### Introduction

This section provides several master responses that have been prepared to address several key issues identified in the various comments received on the RDEIR.

In some cases, multiple comments were received regarding the same planning and/or environmental issues identified in the Recirculated Draft EIR (“RDEIR”). In order to provide the commenter with a complete picture regarding his or her concern, the County has prepared a master response to address same or similar comments received regarding certain subject areas. These master responses have been developed to provide a broader context to the response than may be possible when making responses to individual comments. Typically, these master responses provide some background regarding the issue, identify how the issue was addressed in the RDEIR, and provide additional explanation to address the concerns raised. In some cases, these responses have also been prepared to address specific land use or planning concerns (i.e. inclusion of specific policies, etc.) related to the General Plan 2030 Update (proposed project) but unrelated to the RDEIR or environmental issues associated with the proposed project.

The following topics are addressed by the Master Responses:

- Master Response #1: Policy Comments that do not Raise CEQA Issues
- Master Response #2: Previous Comment Letters and the RDEIR
- Master Response #3: Enforceable Policy Language
- Master Response #4: Level of Detail for the General Plan and Programmatic Nature of the RDEIR
- Master Response #5: Land Use Diagram and Build-out Assumptions
- Master Response #6: Water Supply Evaluation Assumptions and Methodology
- Master Response #7: Implementation Measures
- Master Response #8: Foothill Growth Management Plan
- Master Response #9: Range of Alternatives Addressed in the RDEIR
- Master Response #10: Climate Action Plan
- Master Response #11: Discussion of Yokohl Ranch Project

Responses to comments (including references to these master responses) to individual comment letters received on the RDEIR are provided in Chapter 5 “Responses to Comments on the RDEIR” of this FEIR.

## **Master Response #1: Policy Comments that do not Raise CEQA Issues**

During the public review period for the RDEIR, several commenters provided a variety of comments requesting changes to the planning concepts (i.e., policy revisions, etc.) provided in the County’s General Plan 2030 Update. This master response has been developed to address various comments related to the general plan concepts and policies that do not raise issues specific to the environmental analysis provided in the RDEIR or other CEQA issues.

This Final EIR (FEIR) responds to comments received on the RDEIR during the public review period between March 25, 2010 and May 27, 2010 that address concerns specific to environmental impacts of the proposed project or to the adequacy or completeness of the environmental analysis. (Pub. Res. Code Section 21091(d) (2) (B), CEQA Guidelines Sections 15088(c), 15204(a) It is common in comprehensive General Plan updates, given the broad nature and multiple functions of a General Plan that a number of the comments on the RDEIR do not address environmental issues or CEQA concerns. The CEQA Guidelines do not require a formal response to such comments, even though they may well address legitimate concerns of public policy (e.g., economic, fiscal, or social issues). Some comments just question why certain changes are made. Additionally, some comments merely express approval or disapproval of the proposed project or particular policies. Some comments criticize the proposed project from a policy standpoint, or characterize it in negative terms, but do not argue that the RDEIR is in any way deficient. Still other comments offer suggested changes to proposed new and old policy language. All such comments are part of the administrative record for the General Plan 2030 Update process, and all will be forwarded to County decision-makers for their careful consideration. In addition to weighing the various benefits and detriments associated with the proposed project and the other alternatives, the County decision-makers will balance economic, social, fiscal, and other policy concerns against the environmental impacts of the various options.

## **Master Response #2: Previous Comment Letters and the RDEIR**

Several commenters attached letters they or others had previously submitted, in 2008, commenting on the originally published Draft EIR (DEIR). The majority of these comment letters also included new, 2010 letters of equivalent level of detail. This master response has been developed to address the individual comments referring to previously submitted 2008 comment letters. As discussed under CEQA Guidelines Section 15088.5(f)(1) below, the County does not have the duty to decipher what comments the public or agencies believe to still be applicable or inapplicable from their 2008 comment letters, which is why they have been given the opportunity to draft new comment letters.

In January 2008, the County published the Tulare County General Plan 2030 Update Draft Environmental Impact Report (DEIR), i.e. the original DEIR. The original DEIR assessed the environmental implications of implementing the proposed project. The original DEIR was circulated for public review and comment for an extended period of over 90 days (January 14, 2008 through April 15, 2008) to allow for maximum public involvement and input. A copy of the Notice of Completion (including extensions, published January 14, 2008), requesting public comment was attached to the RDEIR as part of Appendix A.

As noted in the RDEIR there have been substantial revisions to the proposed General Plan 2030 Update released in 2010, as well as the RDEIR, which was recirculated in its entirety. These revisions are described in the RDEIR starting on pages ES-6 and 1-3. In drafting these revisions the County carefully considered each of the comment letters received on the previous DEIR in 2008.

As discussed under CEQA Guidelines Section 15088.5(f)(1), “When an EIR is substantially revised and the entire document is recirculated, the lead agency may require reviewers to submit new comments and, in such cases, need not respond to those comments received during the earlier circulation period. The lead agency shall advise reviewers, either in the text of the revised EIR or by an attachment to the revised EIR, that although part of the administrative record, the previously comments do not require a written response in the final EIR, and that new comments must be submitted for the revised EIR. The lead agency need only respond to those comments submitted in response to the recirculated revised EIR.” Consistent with the requirements of this section, the County notified reviewers that responses would not be prepared for comments on the 2008 DEIR (see page ES-8 of the RDEIR, in addition to the Notice of Availability of the RDEIR).

This approach is also consistent with CEQA Guidelines Section 15204(a), which states that in drafting comment letters the public should “focus on the sufficiency of the document in identifying and analyzing the possible impacts on the environment and the way in which the significant effects of the *project* might be avoided or mitigated” (Emphasis added). Furthermore, as discussed in CEQA case law, the lead agency does not have a duty to respond to “non-project-specific secondary materials submitted in support of the comments.” (*Environmental Protection & Information Center v. California Dept. of Forestry and Fire Protection* (2008) 44 Cal.4th 459, 484) As also noted in recent CEQA case law, comments/issues “must be ‘fairly presented’ to the agency...Evidence must be presented in a manner that gives the agency the opportunity to respond with countervailing evidence...The City cannot be expected to pore through thousands of documents to find something that arguably supports CREED’s belief the project should not go forward.” (*Citizens for Responsible Equitable Environmental Development v. City of San Diego* (4th App. Dist, June 10, 2011, Case No. D057524) 196 Cal. 4<sup>th</sup> 515. (See also *Save the Plastic Bag Coalition v. City of Manhattan Beach* (CA Supreme Court, July 14, 2011) 51 Cal.4<sup>th</sup> 310, 322 [Comments should not rely upon non-project-specific “generic studies.”])

In the current instance, both the proposed project and the RDEIR have been substantially revised in comparison to the 2008 documents. Because of these substantial revisions, previous comments are generally no longer be applicable to the currently proposed 2010 draft of the General Plan (project), which is why additional opportunities to comment on the revised General Plan 2030 Update and the

RDEIR have been provided. As discussed under CEQA Guidelines Section 15088.5(f)(1) above, the County does not have the duty to decipher what comments the public or agencies believe to still be applicable or inapplicable from their 2008 comment letters, which is why an opportunity to draft new comment letters has been provided.

For example, several 2008 comments letters requested that additional information from the Background Report be provided in the environmental setting text of the RDEIR. These revisions were made in the 2010 RDEIR, which makes such comments inapplicable. During the public review period for the original DEIR, the County accepted approximately 90 written communications (over 770 pages of written communication with more than 800 pages of attachments) from agencies, organizations and individuals with comments on the then-proposed project and original DEIR. The County and its consultants reviewed these comments to determine whether any additional environmental analysis would be required to respond to issues raised in the comments. Based on that review, the County determined that several subjects warranted additional information, analysis or clarification and, consequently, a revised DEIR (this RDEIR) was prepared for recirculation. The County also considered the various comments on the initial General Plan 2030 Update document and prepared an updated plan for analysis in the RDEIR as well.

A summary of key revisions is provided below:

- **Updated Land Use/Circulation Diagram:** The County has included a more detailed land use/circulation diagram showing the location of all future growth areas proposed as part of the General Plan Update. Refer to Figure 1-2 and 1-3 in Chapter 1 of this FEIR. This diagram is derived from the Tulare County Planning Areas (Figure 4-1) in the Goals and Policies Report (Part I of the General Plan Update). This figure also identifies the Urban Development Boundaries within which future urban growth is expected to occur under the General Plan 2030 Update.
- **Initiate Climate Action Strategy:** In light of the recent legislative actions (AB 32 and SB 375) specific to sustainability and climate change, the County has initiated a Climate Action Strategy specific to its unique rural nature. As an initial step, the County has prepared a Greenhouse Gas (GHG) Inventory for the Planning Area. Information from the inventory as well as applicable regulatory information is incorporated into the Air Quality section (Section 3.3) and the Energy and Global Climate Change section (Section 3.4) of the RDEIR and draft Climate Action Plan has been prepared. Consequently, the analysis of air quality impacts now includes a more robust discussion of the proposed project's impacts associated with climate change. Additionally, the RDEIR now recommends including a number of additional policies (in the areas of sustainability, energy conservation, and climate change) that will assist the County in meeting the GHG emissions reduction goals set by the State.
- **Updated Stationary Air Emission Analysis:** The RDEIR includes a more thorough list of estimates for stationary sources of air pollution (see Section 3.3, "Air Quality" and Section 3.4, "Energy and Global Climate Change"), including industrial emissions, residential emissions, agricultural emissions, landfills, power plants, and oil and gas production. Many of these sources were developed as part of the Greenhouse Gas Inventory report and subsequently incorporated into the RDEIR (see appendix E).
- **Updated Water Supply Analysis:** The RDEIR incorporates the results of a water supply evaluation prepared by Tully and Young for the proposed project prepared June 2009 (see appendix E). Using the most current (or readily available) data from the Department

of Water Resources and other sources, the water supply evaluation provides a representation of ‘existing’ supply and demand conditions and projects ‘future’ conditions contemplated by the proposed project. Section 3.6 “Hydrology, Water Quality, and Drainage” and 3.9 “Public Services, Recreation Resources, and Utilities” of this RDEIR have been prepared with information from the water supply evaluation, which is included as Appendix G to the RDEIR. These updated sections (and the water supply evaluation) are intended to supplement the original water supply information provided in the General Plan Background Report.

- Updated General Plan Background Report (“2010 Background Report”):** To the extent feasible, the County has updated baseline data in the 2010 Background Report for topics for which more recent data was available. While not all topics of the original Background Report were updated, data to help determine the baseline condition for environmental resource topics addressed in the RDEIR was the focus of the update. These topics include Demographics, Land Use, Agriculture, Recreation, and Open Space, Biological Resources, Air Quality, Safety (including Geologic and Seismic Hazards, Flood Hazards, Fire Hazards, Human-Made Hazards, and Climate Change), Biological Resources, Archaeological Resources, and Historical Resources, Natural Resources (including Mineral Resources, Oil and Gas Resources, and Timber Resources), and Scenic Landscapes. This information was also used to update the environmental setting sections of each resource topic addressed in the RDEIR (see Sections 3.1 through 3.12 of the RDEIR). The 2010 Background Report is a supporting document to the RDEIR that provides both historic and baseline information that is incorporated by reference to this RDEIR. This report is also included as Appendix B to this RDEIR.
- Enforceability of Goals and Policies:** In light of the various comments received on the previously proposed 2008 draft of the General Plan and DEIR the County has made several revisions to the Goals and Policies Report in the 2010 draft of the General Plan. These changes, including several important changes to policies, provide for greater clarity. The updated Goals & Policies Report (Part I of the General Plan Update) refines the “project” that is evaluated in this RDEIR. Table 4-1 (below) provides a numerical summary of the various policy and implementation measures changes resulting from comments received during the initial public review of the proposed project.

**TABLE 4-1  
NUMERICAL SUMMARY OF KEY POLICY REVISIONS TO GOALS & POLICIES REPORT**

	<b>New Policies and Measures (to 2008 draft version)</b>	<b>Modifications to Existing (2008 draft version) Policies and Measures</b>
<b>Policies</b>	24 new policies	75 with minor revisions. 125 with new or revised text.
<b>Implementation Measures</b>	13 new measures	28 with minor revisions. 69 with new or revised text.

- Organization of the Goals and Policies Report:** Part I and II of the Goals and Policies Report were reformatted to facilitate review of the General Plan. Additionally, Chapter 1 “Introduction” of the Goals and Policies Report was expanded to describe the organization of the document and the General Plan’s relationship to other key planning documents in the County including existing community plans, mountain service center plans, hamlet development plans, and corridor plans. To facilitate review of the document, the section also summarizes updated or deleted sections and elements that occurred as part of the General Plan 2030 Update.

- Organization of the EIR:** The County has simplified the organization of the RDEIR to more closely resemble the CEQA Checklist found in Appendix G of the CEQA Guidelines. While the original DEIR incorporated the Background Report information and data by reference, this RDEIR includes relevant information from the 2010 Background Report directly in the “Environmental Setting” and “Regulatory Setting” sections of each EIR resource section. Much of this information has been updated, as described previously.

In addition, the Planning Framework Element, Part 1 Chapter 2, was revised to include a set of updated or new policies (including PF-4.17, PF-4.18, PF-4.19, etc.) designed to help define future city growth areas and the important relationship between unincorporated areas and cities within the County. The later relationship is of primary importance as a majority of the County’s future growth is anticipated to occur within the unincorporated areas near cities.

To focus this growth, the Planning Framework Element includes a set of policies designed to address this issue. These policies are summarized below in Table 4-2 with further detail provided in the Goals and Policies Report. Key to these policies includes cooperation between the County and the cities in County Adopted City UAB and UDBs (CACUAB and CACUDB) for each city. A variety of measures are identified in the policies to help determine what development would be appropriate within these areas. For example, Policy PF-4.20 “Application of the Rural Valley Lands Plan checklist” calls for the County to work with individual cities using the Rural Valley Lands Plan or a similar checklist to evaluate applications for special use permits, variances, or land divisions within CACUDBs, and to provide that the County will consider impacts on regional issues (i.e., transportation infrastructure, availability of water, etc.) when reviewing such entitlement applications.

This summary in Table 4-2 represents some of the modifications included as part of the General Plan 2030 Update.

**TABLE 4-2**  
**SUMMARY OF POLICIES (SECTION 2.4 – CITIES) FROM PLANNING FRAMEWORK ELEMENT\***

PF-4.1	CACUABs for Cities	PF-4.15	Urban Improvement Areas for Cities
PF-4.2	CACUDBs for Cities – Twenty Year Planning Area	PF-4.16	Coordination with Cities in Adjacent Counties
PF-4.3	Modification of CACUABs and CACUDBs	PF-4.17	Cooperation with Individual Cities
PF-4.4	Planning in CACUDBs	PF-4.18	Future Land Use Entitlements in a CACUDB
PF-4.5	Spheres of Influence	PF-4.19	Future Land Use Entitlements in a CACUAB
PF-4.6	Orderly Expansion of City Boundaries	PF-4.20	Application of a Checklist to control Development in a CACUDB
PF-4.7	Avoiding Isolating Unincorporated Areas	PF-4.21	Application of the RVLP Checklist to Control Development in a CACUAB
PF-4.8	General Plan Designations Within City UDBs	PF-4.22	Reuse of Abandoned Improvements in a CACUDB
PF-4.9	Updating Land Use Diagram in CACUDBs	PF-4.23	Reuse of Abandoned Improvements in a CACUAB
PF-4.10	City Design Standards	PF-4.24	Annexations to a City within the CACUDB
PF-4.11	Transition to Agricultural Use	PF-4.25	Sphere of Influence Criteria
PF-4.12	Compatible Project Design	PF-4.26	City 50 Year Growth Boundaries
PF-4.13	Coordination with Cities on Development Proposals	PF-4.27	Impacts of Development within the County on City Facilities
PF-4.14	Revenue Sharing		

Notes: (\*) Policies PF-4.17 through PF-4.27 are new policies included in the current version of the Goals and Policies Report designed to highlight the County’s desire to coordinate land use decisions with other jurisdictions.

As previously described, the County reviewed and considered all comments received on the 2008 Draft EIR, made changes to address these comments which are now incorporated and presented in the General Plan 2030 Update. Additionally, because the revisions affected substantial portions of the proposed project, the County has opted to republish and recirculate the entire document, rather than selected sections of the Draft EIR. Consequently, as discussed above, previous comments received on the January 2008 draft EIR and addressed by the analysis provided in the RDEIR do not require a written response in the Final EIR, and the County, as provided in CEQA Guidelines, section 15088.5(f)(1), will not respond to individual comments received on the January 2008 Draft EIR.

## **Master Response #3: Implementation and Enforcement of General Plan Policy Language**

### **How the General Plan will be Implemented**

Several commenters have suggested the General Plan policies will not be implemented or have questioned who will implement these changes.

In compliance with State law, the General Plan consists of a statement of development policies and includes diagrams and text setting forth objectives, principles, standards, and plan proposals (see Gov. Code §65302). These policies and objectives are then implemented by the County and its Staff through various other actions, such as the adoption of new zoning ordinances, area and sub area plans, community plans, hamlet plans and Mountain Service Center (“MSC”) plans, which are more detailed and specific (see Gov. Code §§ 65359, 65400, 65455, and 65860). Some of these actions, such as the adoption or revisions to County Ordinances, are outlined in the “Implementation” Sections of the proposed General Plan (see also Master Response #8). However this is not an exclusive list of implementation measures. While the County has listed numerous implementation measures in the General Plan, and noted in the RDEIR, it is simply not feasible to list every potential implementation measure which will be adopted over the 20 year horizon of the General Plan, nor to provide the text of every potential ordinance that will be adopted as a result of General Plan implementation. In other instances, such as the adoption of Community Plans, subdivisions, special use permits the projects are reviewed by the Board of Supervisors, Planning Commission, and various other County agencies and staff, for consistency with the General Plan.

### **Policy Language Enforceability**

Several commenters have expressed skepticism that certain words used in policies would result in enforceable policies. Words such as “encourage”, “may”, “support”, and the use of should versus shall, were specifically mentioned.

Several commenters questioned the use of the term “should” instead of “shall” in specific policies throughout the General Plan. At least one commenter states that the use of the term “shall” is necessary to “...make a policy effective and enforceable.” This is not the case.

Bryan A. Garner's "A Dictionary of Modern Legal Usage", New York: Oxford University Press, 1995, pp. 939-942, discusses the use of the terms "shall" and "should" under the entry "Words of Authority" (Garner is a well-known legal linguist and is Editor-in-Chief of "Black's Law Dictionary.") He delineates an "American Rule" whereby the use of "shall" is restricted exclusively to the meaning "has a duty to" while "should" denotes a directory provision. A "directory provision" (as opposed to a "peremptory provision" or a "mandatory provision") requires substantial compliance only; not exact compliance. The emphasis is on substantial compliance in line with the spirit and purpose of the legislation, rather than formal compliance with the letter of the law. Typical planning practice suggests that the use of the term "shall" in constructing policies is preferred for site specific projects; but is not necessarily required in broad legislative policy. "Shall" is considered a mandatory directive that leaves no uncertainty or flexibility. "Should", as used in General Plan policy development, is a less rigid directive to be honored in the absence of compelling or contravening considerations. Policy makers will typically use or employ the term "shall" to communicate a mandatory requirement and "should" to communicate a clear commitment that permits flexibility if circumstances so dictate. Policies containing the term "should" remain effective and enforceable. They are clear expressions of the policy makers' (i.e. Board of Supervisors) intent to rely on the subject policy to guide relevant decisions, and so must be recognized and analyzed in such decisions.

As discussed in the Governor's Office of Planning and Research (OPR) General Plan Guidelines, "given the long-term nature of a general plan, its diagrams and text should be general enough to allow a degree of flexibility in decision-making as times change" (Office of Planning and Research 2003 General Plan Guidelines, page 14). This statement recognizes the value in maintaining flexibility to address unforeseen or evolving circumstances. While some of the policies may have flexibility, CEQA does not require the County to assume a worst case scenario (i.e. that they will not be implemented); (*Towards Responsibility in Planning v. City Council* (1988) 200 Cal.App.3d 671; *Save Round Valley Alliance v. County of Inyo* (2007) 157 Cal.App.4th 1437; CEQA Guidelines Sections 15064 and 15358; see similar NEPA requirements *Robertson v. Methow Valley Citizens Council* (1989) 490 U.S. 332).

Similarly, flexibility is needed to address the peculiarities of specific parcels and specific projects as they are proposed. The County will need to balance numerous planning, environmental, and policy considerations in the General Plan based upon the specific parcels of land and projects. Mandatory language or outright bans on development in certain areas suggested in some comment letters while beneficial for one resource area, could potentially have unintended consequences for other resources areas. While the County has addressed these impacts to the greatest extent feasible in the RDEIR, there could be unknown circumstances and parcels of property with peculiar features which warrant some flexibility. For example, an outright ban on development on an unknown parcel in a flood zone could force development into other areas with greater geologic, fire, or other hazards. For example, some commenters requested a ban on all development in flood zones (Comment I11-124), others request limiting development based upon fire considerations (Comment I25-5), and others requested a ban on development for areas that could affect cultural resources (Comment I22-12). Flexibility is needed to allow decision makers to balance all of these concerns once specific projects on specific parcels are proposed.

## Adequacy of Self Mitigating Goals and Policies

Some commenters have suggested that the individual policies in the RDEIR designed to avoid impacts (i.e. self mitigating) improperly defer mitigation of some impacts and suggest that these mitigation measures and policies should be more specific. Commenters also contend that some policies and mitigation measures are infeasible, unenforceable, unlikely to be carried out, or unlikely to be successful.

The proposed 2010 General Plan is a policy document to provide a long term, comprehensive plan for the physical development of the County. It generally describes the type, intensity, and location of development that may occur within the County, and provides policies that will guide the design and provide basic standards for that development. The General Plan itself is not intended to provide the level of detail that is found in an ordinance or special use permit condition.

Several commenters questioned the enforceability of individual policies. General Plan policies should not be reviewed in a vacuum. All of the goals and policies have been proposed as part of a comprehensive system (i.e. the entire General Plan); (for example see Table on RDEIR page 3.6-39). These policies will be interpreted in relationship to the other goals, policies, and implementation measures contained in the General Plan. Additionally, development (i.e. build out) under the proposed project will also have to comply with existing Federal, State and local regulations which are also outlined in the individual resource chapters (for example, see RDEIR pages 3.6-5 through 3.6-14). CEQA case law also supports the use of compliance with regulatory requirements to help reduce or avoid impacts (see *City of Long Beach v. Los Angeles Unified School District* (2009) 176 Cal.App.4th 889, 913, 914 [discussing compliance with Safe School Plan requirements under Education Code Sections 32282 et seq. to help avoid hazardous material impacts]; *Sundstrom v. County of Mendocino* (1988) 202 Cal.App.3d 296, 308 [“compliance [with environmental regulations] would indeed avoid significant environmental effects”]; see also CEQA Guidelines Sections 15002(h)(3), 15064(h)(3), and 15130(c.)).

As described above, the General Plan’s goals and policies will be implemented and realized through County ordinances and future County decisions on specific development projects. As discussed in the OPR Guidelines, the General Plan should “be general enough to allow a degree of flexibility in decision-making as times change.”

## Adequacy of Mitigation Measures

Some commenters have suggested that the mitigation measures in the RDEIR designed to avoid impacts improperly defer mitigation of some impacts and suggest that these mitigation measures and policies should be more specific. Commenters also contend that some policies and mitigation measures are infeasible, unenforceable, unlikely to be carried out, or unlikely to be successful.

These mitigation measures will become part of the proposed project and should also be read in conjunction with the goals, policies, and implementation measures that are part of the proposed General Plan. Mitigation Measures are components of the RDEIR and are subject to the same
